In other words, for every dollar you had made in American business, you'd have less than a penny by - of gain - by buying in this store of value, which people tell you to run to every time you get scared by the headlines or something of the sort.

It's just remarkable to me that we have operated in this country with the greatest tailwind at our back that you can imagine. It's an investor's haven - I mean, you can't really fail at it unless you buy the wrong stock or just get excited at the wrong time.

But if you'd - if you owned a cross-section of America and you put your money in consistently over the years, there's just - there's no comparison against owning something that's going to produce nothing.

And there - frankly - there's no comparison with trying to jump in and out of stocks and pay investment advisors.

If you'd followed my advice, incidentally - or this retrospective advice - which is always so easy to give - (Laughs)

If you'd follow that, of course you - there's one problem. Your friendly stock broker would have starved to death.

I mean, you know, and you could have gone to the funeral to atone for their fate. But the truth is, you would have been better off doing this than a very, very, very high percentage of investment professionals have done, or people have done that are active that - it's very hard to move around successfully and beat, really, what can be done with a very relaxed philosophy.

And you do not have to be - you do not have to know as much about accounting or stock market terminology or whatever else it may be, or what the Fed is going to do next time and whether it's going to raise three times or four times or two times.

None of that counts at all, really, in a lifetime of investing. What counts is having a philosophy that you've - that you stick with, that you understand why you're in it, and then you forget about doing things that you don't know how to do.

4. Nothing's changed - Buffett's still "semi-retired"

WARREN BUFFETT: So with all those happy words, we will move on and start the questioning, and we'll start with Carol.

CAROL LOOMIS: Good morning. In choosing a first question to ask each year, I look for a question that is definitely Berkshire-related and is timely. And this question seemed to fill the bill. The question came from William Anderson (PH) of Salem, Oregon.

And he said, "Mr. Buffett, you have previously said that there are two parts to your job, overseeing the managers and capital allocation. Mr. [Greg] Abel and Mr. [Ajit] Jain now oversee the managers, which leaves you with capital allocation.

"However, you share capital allocation with Ted Weschler and Todd Combs. Question. Does all that mean you are semi-retired? Or if not, please explain." (Laughter)

WARREN BUFFETT: I've been semi-retired for decades. (Laughter)

The answer is that I was probably - well, it's hard to break down the percentage of the time that I was involved in but now - the jobs that are now done by Ajit and Greg, and in the case of investing, the sub part of the job that is done by Ted and Todd.

Ted and Todd each manage 12- or \$13 billion, so in total, that's 25 billion. And we have in equities 170-some billion, probably now, and 20 billion in longer-term bonds, and another hundred billion in cash and short-term.

So they're managing 20 - 25 and doing a very good job. And I still have the responsibility, basically, for the other 300 billion. So - (Laughter and applause)

I think Charlie will tell you - in fact, I'd like him to comment - nothing's really changed that much. We've got - clearly we've got two people in Ajit and Greg that are smarter, more energetic, just bring more to the job every day.

But they don't bring too much, because the culture is that our managers are running their business. But there's a lot - there's a good bit to oversee. So they do a superb job.

And Ted and Todd not only do a great job with the 12 or 13 billion each - they started with a couple billion each - not that it's all been the growth of the 2 billion - but they also do - have done a number of things for Berkshire that they do it cheerfully, but more important, very skillfully.

So there's just - there's one thing after another that I will have them looking into or working on. And sometimes I steal their ideas and -

But I think, actually, semi-retired is probably - catches me at my most active point. I think if - (laughter) - your questioner's got a good point.

OK, Charlie?

CHARLIE MUNGER: Well, I've watched Warren for a long time, and he sits around reading most of the time and thinking. And every once in a while he talks on the phone or talks to somebody. I can't see any great difference. A lot of people - (Laughter)

Part of the Berkshire secret is that when there's nothing to do, Warren is very good at doing nothing. (Laughter)

WARREN BUFFETT: I'm still looking forward to being a mattress tester. (Laughter)

5. Precision Castparts is "a very good business"

WARREN BUFFETT: OK, Jonathan Brandt.

JONATHAN BRANDT: Hi Warren. Hi Charlie. Given the growth in airplane build rates, it seems surprising that Precision Castparts isn't doing better on the top or bottom line.

I understand the issue with a bumpy transition from old to new programs, but I've also heard from industry sources that Precision's market position is not as strong as it used to be amid intensifying competition and some technological disruption.

What does Precision need to do to solidify and strengthen its preeminent position with its aerospace customers so that it can deliver the growth you expected when Berkshire acquired it?

WARREN BUFFETT: Yeah -

JONATHAN BRANDT: More generally, two years after the acquisition, what is your outlook for that business?

WARREN BUFFETT: Give me the last part again. The outlook.

JONATHAN BRANDT: More generally, two years after the acquisition, what is your updated outlook for that business longer term?

WARREN BUFFETT: Oh, longer term, I think - and in the reasonably shorter term - it's a very good business. I mean, you were -

You mentioned aircraft, but we get into other industries. But certainly aircraft's the most important. You have manufacturers that are very dependent on both the quality of the parts and the promptness of delivery.

You do not want to have an aircraft with 75- or 100- or maybe \$200 million and be waiting for a part or something of the sort. So it's -

Reliability is, both in terms of quality and delivery times and all of that sort of thing, is enormously important. And we get contracts that extend out many years. And sometimes we - I mean, we will get them well before the plane even starts in production. So there's very long lead times.

And we have found in the last year - found it earlier, but I know of some specific cases in the last year - where other suppliers have failed in their deliveries and then the manufacturers come to us and say, "We would like you to help us out."

And we say, "Well, we'd be glad to help you out, but we'd like about a five-year contract, if we're going to do it because we're just not going to make up for these other guys' shortfalls periodically." But that sort of thing has a very long lead time.

The business is a very good business. One thing you will see their earnings charged with is about \$400 million - little over \$400 million a year - of intangible - nondeductible in that case - amortization of goodwill, which is really - is not an economic cost in my view.

We have a significant amount of that through Berkshire, but by far, the largest amount is related to the Precision acquisition. So whatever you see, you can add about 400 million that in my view is not an economic expense, but the accountants would argue otherwise. But it's our money, so we'll take my view. The - (Laughter)

Mark Donegan, who runs that operation, is incredible, and he has been not only - he's a fabulous manager. I wouldn't have bought it without him in charge. He also has been very helpful to us in other areas, and he loves to do it. So you can't beat him, both as a manager in his own operation, but with his devotion to really doing everything that will help Berkshire.

It was - it's a very good acquisition with very long tails to the products that are being developed.

Charlie?

CHARLIE MUNGER: Well, yeah, I think we'd buy another one just like it tomorrow if we had the chance.

WARREN BUFFETT: Yeah, that's the answer. (Laughter)

Man of few words, but he gets the point. (Laughter)

6. Trade benefits are huge, so U.S. and China won't do something "foolish"

WARREN BUFFETT: OK, now we will go to the shareholder in Station 1. I believe that's probably up here to my right.

AUDIENCE MEMBER: Hello. This is Chao (PH) from Wuxi, China, (Inaudible) Capital. I've been to the meeting for 12 years. Wish you and Charlie good health, so we could see you both from meeting for 12 more years.

WARREN BUFFETT: Thank you. (Applause)

AUDIENCE MEMBER: Quick question. We know both you and China delegations - U.S. and China delegations - are in China for intense discussion, also called a trade war.

Let's go one step beyond the trade war. Do you think there's a win-win situation for both countries or the world is just too small for both to win and we have to revisit your 1942 chart again? Thank you.

WARREN BUFFETT: Thank you. I'd like to just mention one thing. In August, I'm going to be 88, and that will be the eighth month of the year, and it's a year that ends with an eight.

And as you and I both know, eight is a very lucky number in China. So if you find anything over there for me, this is the time we should be acquiring something. All those eights.

AUDIENCE MEMBER: Will do. (Buffett laughs)

WARREN BUFFETT: The United States and China are going to be the two superpowers of the world, economically and in other ways, for a long, long, long time.

We have a lot of common interests, and like any two big economic entities, there are times when there'll be tensions.

But it is a win-win situation when the world trades, basically. And China and the U.S. are the two big factors in that, but there's plenty of other citizens of the world that are involved in how this comes out. And there is no question -

The nice thing about in this country I think is that both Democrats and Republicans basically, on balance, believe in the benefits of free trade.

And we will have disagreements with each other. We'll have disagreements with other countries on trade.

But it's just too big and too obvious for - that the benefits are huge, and the world's dependent on it in a major way for its progress, that two intelligent countries will do something extremely foolish.

We both may do things that are mildly foolish from time to time, and there is some give and take, obviously, involved.

But U.S. exports in 1970 and U.S. imports in 1970 were both about 5 percent of GDP. I mean, here we were, selling 5 percent of our GDP and buying up 5 percent of our GDP, basically.

Now people think we don't export a lot of things. Our exports are 11 and a fraction percent of GDP. They've more than doubled as a share of this rising GDP. But the imports are about 14 1/2 percent, so there's a gap of three percent or thereabouts.

And I would not like that gap to get too wide. But when you think about it, it's really not the worst thing in the world to have somebody send you a lot of goods that you want and hand them little pieces of paper.

I mean, because the balancing item is, if you have a surplus or deficit in your trade, you're going to have a surplus in investment.

And so the world is getting more claim checks on the United States, and they - to some extent they buy our government securities, they can buy businesses.

And over time, you don't want the gap to get to be too wide because the amount of claim checks you are giving out to the rest of the world could get a little unpleasant under some circumstances.

But we've done remarkably well with trade. China's done remarkably well with trade. The countries of the world have done remarkably well with trade. So it is a win-win situation.

And the only problem gets to be when one side or the other may want to win a little bit too much, and then you have a certain amount of tension.

But we will not sacrifice - the world, I mean - will not sacrifice world prosperity based on differences that arise in trade.

Charlie?

CHARLIE MUNGER: Yeah, well I think that both countries have been advancing. And of course China is advancing faster economically, because it started from a lower base and they've had a little more virtue than practically anybody else in the world in having a high savings rate.

And of course, a country that was mired in poverty for a long, long time, and that assimilates the advanced technology of the world, and has a big savings rate, is going to advance faster than some very mature company like Britain or the United States. And that's what's happened.

But I think we're getting along fine, and I'm very optimistic that both nations will be smart enough to realize that the last thing they should do is have any ill will for the other.

7. Deals don't depend on Buffett: "The reputation belongs to Berkshire now"

WARREN BUFFETT: OK, Becky Quick. (Applause)

BECKY QUICK: This question comes from Kirk Thompson.

He says, "Warren, in this year's annual letter to shareholders, you referenced both cheap debt and a willingness by other companies to leverage themselves as competitive examples as to why it's hard to get more acquisition deals done.

"It seems like the trust in - and prestige of doing a deal with Warren Buffett and Charlie Munger allow Berkshire to get a hometown discount and beat out other firms that might pay a little more to a prospective seller.

"Have you given thought to having other Berkshire managers have more public exposure, so future generations of successful business owners continue to bring deal opportunities to Berkshire like they have in prior decades?"

WARREN BUFFETT: Yeah, that sort of reminds me of - who was it? Tony O'Reilly remarked one time about the responsibility of a CEO.

That the very first job of the CEO was to search through his organization and find that person who had the initiative and the brains, the determination, all of the qualities to be his logical successor, and then fire the guy. (Laughter)

The - there's no question. I think the reputation of Berkshire as being a very good home for companies - particularly private companies - but a good home for companies, I don't think that reputation is dependent on me or Charlie.

It may take a little, you know, there'll be a little testing period for whoever takes over, in that respect. But, you know, basically we've got the money to do the deals. We'll have the money to do the deals subsequently. People can see how our subsidiaries operate in the future.

And the truth is that, I think some of the other executives are going - are getting better known. But there will be a - you know, I'll tell you this, if things get bad enough, you don't have to worry. They'll be calling us no matter what. (Laughs)

So I do not worry about the so-called "deal flow," which is a term I hate. But I don't think there's - I think that's dependent on Berkshire and not dependent on me.

And, you know, as I've mentioned, my phone isn't ringing off the hook with good deals. So apparently this big winning personality or something is not delivering for you. (Laughter)

So it may be the next person will be even more - get even more calls.

Berkshire - the reputation belongs to Berkshire now. And we are, for somebody that cares about a business that they and their parents and maybe their grandparents lovingly built over decades - if they care about where that business ends up being after, for one reason or another, they don't want to keep it or can't keep it in the family, we absolutely are the first call.

And we will continue to be the first call, whether Charlie or I answer the phone or somebody else does.

Charlie?

CHARLIE MUNGER: Well, a lot of the subsidiaries have for a long time already been making all kinds of acquisitions with people they know and we don't. So it's already happening. And, in fact, it's happening more there than it is at headquarters, so -

WARREN BUFFETT: Don't tell them, Charlie.

CHARLIE MUNGER: You're getting your wish. (Laughter)

And it is weird that about 99 percent of the public companies that change hands, in terms of control, change hands in a sort of auction presided over by an investment banker.

And the people that buy are usually just leverage it to the gills, and when it starts doing a little better, they re-leverage it.

And that money is coming out of the charitable endowments and pension plans who are making these highly-leveraged investments in all these companies changing hands at very high prices. Sooner or later, this is not going to work perfectly.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And it's going to have an unpleasant episode. And I think we'll be around and in good shape at that time.

WARREN BUFFETT: There was one fellow who came to me many years ago. And he had a wonderful business. And he had been worried because he had seen a friend of his die.

And the problems that arose later when the managers, to some extent, tried to take advantage of the widow. And it became a disaster.

So he said he thought about it a lot the previous year. And he decided he didn't want to sell the business to a competitor, who would be a logical buyer, because they would fire all of his people. And the CFO that would remain, and, you know, all up and down the line, they'd all be the acquirer's people. He didn't want to do that to his people.

And then he thought, and he didn't want to sell it to a private equity firm, because he thought they'd leverage it up. He never liked to leverage that much, and then they'd just resell it later on to somebody, so it would be totally out of control of what he wanted to do.

And he wanted to keep running it himself. So he said, "Warren," he said, "It isn't that you're such a great guy," he says, "It's you're the only one left." So - (Laughter) -

Berkshire will continue to be the only one left in many cases.

8. "We don't know what we're doing" in cyber insurance

WARREN BUFFETT: Gary Ransom.

GARY RANSOM: Good morning. Warren, in your annual letter, you wrote about a potential for a \$400 billion natural catastrophe event, something out in the tail of the loss distribution. I can think of another risk that could have a similar order of magnitude, and that would be cyberrisk.

I'm sure all your managers have taken steps against that potential, but in - out in the tail of the cyberrisk distribution, it could hit a lot of industries, a lot of your companies. So how do you think about and prepare for the big one in cyber?

WARREN BUFFETT: Yeah. Well, I include, incidentally, in my - that part I wrote in the annual report where I said that roughly - nobody knows the answer on this. I mean, I could stick down two, and somebody else much smarter in insurance would stick down a different figure.

But I think it's about a 2 percent risk of what I call a 400 billion super-cat of all time. And -

But cyber is in that equation. I mean, that's not just earthquakes and that sort of thing. And frankly, I don't think we, or anybody else, really knows what they're doing when writing cyber. I mean, we - it is just very, very, very early in the game.

And we don't know what the interpretations of the policies, necessarily, will be. We don't know the degree to which they'll be what - there'll be correlated incidents, which we don't really think are correlated now or haven't had the imagination to come up with.

We know that every year when I go and hear these people from the CIA or wherever it may be, they tell me that the offense is ahead of the defense, and will continue that way.

And I can dream of a lot of cyber incidents, which I'm not going to spell out here, because people that have twisted minds may be - they've probably got more - way more - ideas than I've got, but I don't believe in feeding them any.

But it's a business where we don't - we have a pretty good idea of the probabilities of a quake in California, or the probabilities of a three or a four hurricane hitting Florida, or whatever it may be.

We don't know what we're doing in cyber, and we try to keep - we don't want to be a pioneer on this. We do some business in that arena in Berkshire Hathaway Specialty.

But if you're doing something for competitive reasons - which I'm OK with - but when I'm doing something where I - that people tell me is a competitive necessity, we are going to try not to have - we don't want to be number one or number two or number three in exposures on it. And I don't - and I am sure we are not in cyber. But I don't -

I think anybody that tells you now that they think they know in some actuarial way, either what general experience is likely to be in the future, or what the worst case would be, I think, is kidding themselves.

And that's one of the reasons that I say that a \$400 billion event has a - I think has roughly a 2 percent probability per year of happening.

Cyber's uncharted territory, and it's going to get worse, not better. And then the question is whether, if we have a whole bunch of \$25 billion commercial limits out there, whether there's some aggregation that we didn't foresee or that the courts interpret those policies differently, then you know - they are generally going to give the benefit of the doubt to the insured.

So you're right in pointing that out as a very material risk, which didn't exist 10 or 15 years ago and that - and will be much more intense as the years go along.

And all I can tell you, Gary, is that, that's part of my 400 billion and my 2 percent. But if you've got a different guess, it's just as likely that yours is right than mine on that.

Charlie?

CHARLIE MUNGER: Yeah, well, something that's very much like cyber risk is, you've got computers programmed to do your security trading and your computer goes a little wild from some error.

And that's already happened at least once where somebody just was fine one morning and by the afternoon they were broke because some computer went crazy. We don't have any computers we allow - we allow to do big, automatically trading securities.

I think, generally, Berkshire is less likely than most other places to be careless in some really stupid way.

WARREN BUFFETT: I do think if there's a mega-cat from cyber, and let's say it hits 400 billion, I do not think we'll have more than a 3 percent -

CHARLIE MUNGER: No, no -

WARREN BUFFETT: - exposure.

CHARLIE MUNGER: No, no, we'll get our share.

WARREN BUFFETT: And but it, you know, it will destroy - what will destroy a lot of companies - that we will actually, if we had a \$12 billion loss, I would think, except for the new accounting rule, but I believe from what I call operating earnings, we would probably still have a reasonable profit that year.

I mean, we are in a different position than any insurance company I know of in the world, in our ability to handle the really - really super, super-cat.

OK, shareholder from station 2.

CHARLIE MUNGER: May I point out that the main shareholder to my right here has almost all his net worth in one security. That's likely to be more carefully managed than some public place with people just passing through.

WARREN BUFFETT: Yeah, you don't want a guy that's 64 and is going to retire at 65. And a lot of decisions you really don't want him or her to be making. (Laughter)

9. Capital allocation in the public sector

WARREN BUFFETT: Station 2?

AUDIENCE MEMBER: Wally Obermeyer, Obermeyer Wood Investment Counsel, Aspen, Colorado.

Warren and Charlie, you two have demonstrated great talent in private sector capital allocation and shown the world the power of excellence in this area.

Do you think there is a similar opportunity for outstanding capital allocation in the public sector, at both the state and federal levels? And if so, what approach and/or changes would you suggest for society to achieve these benefits?

CHARLIE MUNGER: That's too tough. Why don't we go on to a new question? (Laughter)

WARREN BUFFETT: I'm afraid I have nothing to add. (Laughter and applause)

I don't mean to be unfair to somebody asking a question, but it - you know, it is unfortunately an entirely different game. And the electorate - the motivations are different, the terms, the reward system is different.

I mean, everything is different. And if we knew how to solve that, we wouldn't - we can't add anything to what you had in your view. I'm sorry on that.

10. Wells Fargo will emerge stronger after its "big mistake"

WARREN BUFFETT: OK, Andrew?

ANDREW ROSS SORKIN: Hi Warren. This question comes from Paul Spieker (PH) of Chicago, Illinois. I believe he may be here today.

He writes, "One of your more famous and perhaps most insightful quotes goes as follows:

"Should you find yourself in a chronically leaking boat, energy devoted to changing vessels is likely to be more productive than energy devoted to patching leaks.'

"In light of the unauthorized accounting scandal at Wells Fargo, of its admission that it charged customers for duplicate auto insurance, of its admissions that it wrongly fined mortgage holders in relation to missing deadlines caused by delays that were its own fault, of its admission that it charged some customers improper fees to lock in mortgage interest rates, of the sanction placed upon it by the Federal Reserve prohibiting it from growing its balance sheet, and of the more than recent \$1 billion penalty leveled by federal regulators for the aforementioned misbehavior, if Wells Fargo company is a chronically leaking boat, at what magnitude of leakage would Berkshire consider changing vessels?"

WARREN BUFFETT: Yeah, well, Wells Fargo (Applause) -

Wells Fargo is a company that proved the efficacy of incentives, and it's just that they had the wrong incentives. And that was bad.

But then they committed a much greater error - and I don't know exactly how or who did it or when, but - ignoring the fact that they had a faulty incentive system which was incenting people to do things that were kind of crazy, like opening nonexistent accounts, et cetera.

And, you know, that is a cardinal sin at Berkshire. We know people are doing something wrong, right as we sit here, at Berkshire.

You can't have 377,000 employees and expect that everyone is behaving like Ben Franklin or something out there. They - we - I don't know whether there are ten things being done wrong as we speak, or 20, or 50.

The important thing is, we don't want to incent any of that if we can avoid it, and if we find - when we find it's going on, we have to do something about it. And that is absolutely the key to it.

And Wells Fargo didn't do it, but Salomon didn't do it. And the truth is, we've made a couple of our greatest investments where people have made similar errors.

We bought our American Express stock - that was the best investment I ever made in my partnership years - we bought our American Express stock in 1964 because somebody was incented to do the wrong thing in something called the American Express Field Warehousing Company. We bought -

A very substantial amount of GEICO we bought that became half the - half of GEICO, for \$40 million because somebody was incented to meet Wall Street estimates of earnings and growth. And they didn't focus on having the proper reserves.

And that caused a lot of pain at American Express in 1964. It caused a lot of pain at GEICO in 1976. It caused a layoff of a significant portion of the workforce, all kinds of things. But they cleaned it up.

They cleaned it up, and look where American Express has moved since that time. Look at where GEICO has moved since that time.

So the fact that you are going to have problems at some very large institutions is not unique. In fact, almost every bank has - all the big banks have had troubles of one sort or another.

And I see no reason why Wells Fargo as a company, from both an investment standpoint and a moral standpoint going forward, is in any way inferior to the other big banks with which it competes on -

It - they made a big mistake. It cost - I mean, we still got - I mean we have a large, unrealized gain in it, but that doesn't have anything to do with our decision-making. But the -

I like it as an investment. I like Tim Sloan as a manager, you know, and he is correcting mistakes made by other people.

I tried to correct mistakes at Salomon, and I had terrific help from Deryck Maughan as well as a number of the people at Munger, Tolles. And I mean, that is going to happen. You try to minimize it.

Charlie says that, "An ounce of prevention isn't worth a pound of cure, it's worth about a ton of cure." And we ought to jump on everything. He's pushed me all my life to make sure that I attack unpleasant problems that surface. And that's sometimes not easy to do when everything else is going fine.

And at Wells, they clearly - and I don't know exactly what - but they did what people at every organization have sometimes done, but it got accentuated to an extreme point.

But I see no reason to think that Wells Fargo, going forward, is other than a very, very large, well-run bank that had an episode in its history it wished it didn't have.

But GEICO came out stronger, American Express came out stronger. The question is what you do when you find the problems.

Charlie?

CHARLIE MUNGER: Well, I agree with that. I think Wells Fargo is going to be better going forward than it would have been if these leaks had never been discovered.

WARREN BUFFETT: Or happened.

CHARLIE MUNGER: Yeah, so I think it's - it - but I think Harvey Weinstein has done a lot for improving behavior, too. (Laughter)

It was clearly an error, and they're acutely aware of it and acutely embarrassed, and they don't want to have it happen again.

You know, if I had to say which bank is more likely to behave the best in the future, it might be Wells Fargo, of all of them.

WARREN BUFFETT: This New York Times that I have here from March 12th, 1942, if you go toward the back of it, in the classified section, you have one big section that says, "Help Wanted Male," and another one that says, "Help Wanted Female."

You know, was the New York Times doing the right thing in those days? You know, I think the New York Times is a terrific paper. But people make mistakes.

And you know, the idea of classifying between - taking ads and saying, "Well, we'll take them and divide them up between men and women, what jobs we think are appropriate," or that the advertiser thinks is appropriate.

We do a lot of dumb things in this world. And GEICO, as I say, in the early 1970s, they just ignored - and you can do it in the setting of proper reserves, which mean they charged the wrong price to new customers because they thought their losses were less than they were.

And I'm sure some of that may have been a desire to please Wall Street or just because they didn't want to face how things were going. But it came out incredibly stronger. You know, and now it's got 13 percent of the households in the United States insured.

And it came out with an attention to reserves and that sort of thing that was heightened by the difficulties that they'd found themselves in where they almost went bankrupt. Forty-two -

CHARLIE MUNGER: It was a lot more stupid than Wells Fargo. It was really stupid what they did way back, right?

WARREN BUFFETT: Yeah. They had the world by the tail, and then they quit looking at the reserve development. But - and American Express was just picking up a few dollars by having the field warehousing company in 1963. And, you know, they were worried whether it was going to sink the company.

And when some guy named Tino De Angelis in, I think it was Bayonne, New Jersey -

In fact, I went to the annual meeting in 1964 of American Express after the scandal developed, and somebody asked if the auditor would step forward.

And the auditor from one of the big firms, which I won't mention, came up to the microphone, and somebody said, "How much did we pay you last year?"

And the auditor gave his answer, and then the questioner said, "Well, how much extra would you have charged us to go over to Bayonne, which was ten miles away, and check whether there's any oil in the tanks?" (Laughs)

So it - you know, here was something - a tiny little operation - some guy was calling him from a bar in Bayonne and telling him this phony stuff was going on, and they didn't want to hear it. They shut their ears to it.

And then what emerged was one great company after this kind of, what they thought was a near-death experience. So it's - we're going to make mistakes.

I will guarantee you that we will get some unpleasant news at Berkshire. I don't know what it'll be, you know - the most important thing is we do something about it.

And there have been times when I procrastinated, and Charlie has been the one that jabs me into action. And so he's performed a lot of services you don't know about. (Laughter)

11. "I like to think I'll be missed a little bit, but you won't notice it"

WARREN BUFFETT: OK. Gregg, Gregg Warren.

GREGG WARREN: Good morning, Warren. I have a little bit of a follow-up on Becky's question.

At the 2014 annual meeting, as well as this morning, you noted that the power of Berkshire brand and its reputation, as well as the strength of Berkshire's balance sheet, would allow the

company's next managers to replicate many of the advantages that have come with your being the face of the organization, one of which has been an ability to extract high rents from firms in exchange for a capital infusion and the Buffett seal of approval during times of financial distress.

I buy the argument about the strength of the balance sheet and believe that deals will continue to be done with sellers still lining up to become part of the Berkshire family, especially if the company's next managers are allowed to keep a ton of cash on hand.

But I'm not entirely convinced that they'll be able to garner the same 8, 9, 10 percent coupons, as well as other add-ons, that you've been able to extract from firms like Goldman Sachs and Bank of America in times of distress.

I'd expect those rents to be at least a few percentage points lower once you're no longer running the show. That is, until those managers build up a reputation to warrant higher returns. Am I right to think about it that way?

WARREN BUFFETT: I'm not sure. The - when we, in two - you mentioned Goldman Sachs, and we also did with General Electric, in September or early October of 2008. We probably could actually have extracted better terms.

You know, I think it might have been counterproductive in the end, but I was - we would have done better, incidentally, financially, if we'd really waited until the panic developed further - because I didn't know how far it would develop - but we could have made a lot better purchases three or four or five months later than we did at that time.

And we also did not want to do something that looked to be so high as to in - make the transaction disadvantageous to Goldman or to GE.

They were going to take the terms we offered, but we actually didn't push it to the limit, because there really wasn't anybody else around.

I think - and we're working on something right now that probably won't happen. It's not huge.

But actually, in this case, both Todd [Combs] and Ted [Weschler] have brought deals to me. One of them brought something to me, and, you know, he was thinking in the same terms that I got - was thinking about - and he's the one that returned the call that he had received about a transaction.

And I do not think the party on the other side is going to care about the fact that they had him on the phone rather than me on the phone. I -

You know, there may - there could be just a little bit at certain times in history. But, you know, we will continue to have our standards of what we think money is worth at any given time. And Ted and Todd think just as well about that as I do.

And there will be times, very occasionally, when our phone will ring a lot. And I don't think they'll hang up because I don't answer it, if they need the money.

Charlie?

CHARLIE MUNGER: Well. The times he's referring to, a lot of them, were like the worst in 50 years. So that's a really rare kind of an occurrence. And we didn't make all that many deals. So I think he's right that it'll be harder for us to make similar deals in the future.

WARREN BUFFETT: Yeah, the problem is the sums involved now, more than the problem of deciding what the proper terms should be. And sometimes we can get what we think is appropriate and sometimes we - most of the time, today, we can't.

But you may see a transaction or two that - not in terms of buying business but in terms of securities - that strike you as perfectly decent ways to invest Berkshire's money.

And they may well have come through Todd or Ted instead of directly to me.

I like to think I'll be missed a little bit, but I - you won't notice it. (Laughter)

12. Buffett talks to Ajit Jain about insurance pricing because it's fun

WARREN BUFFETT: OK, Station 3.

AUDIENCE MEMBER: I'm Todd Lichter (PH) from Boulder, Colorado.

Mr. Buffett, are you still involved in pricing decisions at See's Candies and The Buffalo News? And with what other Berkshire subsidiaries do you take more than a hands-off approach?

WARREN BUFFETT: Yeah, you're correct that at one time I, and for some - for quite a while - both Charlie and I took part in the pricing decisions at See's Candy.

And certainly, for some years, particularly with the question of the survival of The Buffalo News was really in question, I definitely took part in those decisions.

In both cases, we had good managers, but still we wanted to - we thought those decisions were important. But it's been a long, long time - very long time - since we've participated in anything like that.

I can't tell you what the per pound price is for See's Candy, which is because people, and you're invited to join this group, send me free candy from time to time. (Laughter)

And I can't - I really, I can't tell you the prices at The Buffalo News. All I know is it's very, very, very hard to move up prices on advertising, generally. So no, we -

The only thing is, Ajit [Jain] and I talk frequently. And if there's some very big risk, if somebody wants a \$5 billion cover on a chemical plant some way excessive loss of over 3 billion or something - we have a certain amount of fun with him deciding on the price in his head. And I decide in my head, and then we compare notes.

It's the kind of risk that you really can't look up in a book and see, actuarially, what it's fairly - the parameters - are fairly likely to be.

I enjoy thinking through the pricing of that, and I particularly enjoy comparing it with Ajit. So the -

These are just oddball situations, but we do that sort of thing, and we've done it for three decades. And it's part of the fun of my job.

The candy prices, if you got to complain about those, you have to go to Charlie. (Laughter)

CHARLIE MUNGER: Well, the answer is, Warren is still doing it and talking to Ajit, and - but that's because Ajit likes it that way.

WARREN BUFFETT: Yep.

CHARLIE MUNGER: We have a very peculiar place where the - where Warren's contact with the various people elsewhere in the organization largely depends on what they want, not what he wants.

WARREN BUFFETT: The CEO of one of our -

CHARLIE MUNGER: It's very unusual, and it's worked beautifully.

WARREN BUFFETT: The CEO of one of our most successful subsidiaries, I may have talked to - unless I saw him here and just said hello - I probably talked to him three times in the last ten years.

And he does remarkably well. (Laughs)

He might have done even better if I hadn't talked to him those three times. (Laughter)

And on the other hand, Ajit and I talk very, very frequently. And he's got the kind of business, A, I do know - I know more about the insurance business than I know about a good many of the other businesses.

And it's interesting. And we are evaluating things that you don't look up in a book, you know. I mean, actuarial talent is not what's important in the things that Ajit talks to me about. It's plenty important throughout our insurance operation.

But in these particular cases, you know, we're making judgments, and his judgment's better than mine. But I like to - I just like to hear about them. They're interesting propositions.

13. Putting business values in income account is "enormously deceptive"

WARREN BUFFETT: OK, Carol.

CAROL LOOMIS: ... shareholder named Jack Ciesielski . He's a well-known accounting expert, who for many years has written "The Accounting Observer."

"Mr. Buffett, in this year's shareholder letter you have harsh words for the new accounting rule that requires companies to use market value accounting for their investment holdings.

"For analytical purposes,' you said, 'Berkshire's bottom-line will be useless.'

"I'd like to argue with you about that. Shouldn't a company's earnings report cite everything that happened to, and within, a company during an accounting period?

"Shouldn't the income statement be like an objectively written newspaper informing shareholders of what happened under the management for that period, showing what management did to increase shareholder value and how outside forces may have affected the firm?

"If securities increased in value, surely the company and the shareholders are better off. And surely they're worse off if securities decreased in value.

"Those changes are most certainly real. In my opinion, ignoring changes in the way that some companies ignore restructuring costs, is censoring the shareholders' newspaper.

"So my question is, how would you answer what I say?" (Laughter)

WARREN BUFFETT: Well, my answer to the question that asks what my answer would be to what he said - the - I would ask Jack, if we've got \$170 billion of partly-owned companies, which we intend to own for decades, and which we expect to become worth more money over time, and where we reflect the market value in our balance sheet, does it make sense to, every quarter, mark those up and down through the income account, when at the same time we own

businesses that have become worth far more money, in most cases, and become, you know, since we bought - you name the company - take GEICO, an extreme case - we bought half the company for \$50 million, roughly - do we want to be marking that up every quarter to the value - and having it run through the income account?

That becomes an appraisal process. There's nothing wrong with doing that, in terms of evaluation. But in terms of - and you can call it gain in net asset value or loss in net asset value - that's what a closed-end investment fund, or an open-investment fund would do.

But to run that through an income account - if I looked at our 60 or 70 businesses, or whatever number there might be, and every quarter we marked those to market, we would have, obviously, a great many, in certain cases, where over time we'd have them at 10 times what we paid, but how quarter-by-quarter we should mark those up and run it through the income account, where 99 percent of investors probably look at net income as being meaningful, in terms of what has been produced from operations during the year, I think would be - well, I can say it would be enormously deceptive.

I mean, in the first quarter of this year - you saw the figures earlier - where we had the best what I would call operating earnings in our history, and our securities went - were down six billion, or whatever it was, to keep running that through the income account every day you would say that we might have made on Friday, we probably made 2 1/2 billion dollars. Well, if you have investors and commentators and analysts and everybody else working off those net income numbers and trying to project earnings for quarters, and earnings for future years, to the penny, I think you're doing a great disservice by running those through the income account.

I think it's fine to have marketable securities on the balance sheet - the information available as to their market value - but we have businesses there - if we - we never would do it - but if we were to sell half, we'll say, of the BNSF railroad, we would receive more than we carried - carried for them - we would turn - we could turn it into a marketable security and it would look like we made a ton of money overnight. Or if we were to appraise it, you know, appraise it every three months and write it up and down, A, it could lead to all kinds of manipulation, but B, and it would just lead to the average - to any investor- being totally confused.

I don't want to receive data in that manner and therefore I don't want to send it out in that manner.

Charlie?

CHARLIE MUNGER: Well, to me it's obvious that the change in valuation should be noted, and it is and always has been - it goes right into the net worth figures.

So the questioner doesn't understand his own profession. (Laughter and applause)

I'm not supposed to talk that way but it slips out once in a while. (Laughter)

WARREN BUFFETT: Sometimes he even gives it a push. (Laughter)

14. McLane profits hurt by severe competitive pressure

WARREN BUFFETT: OK. Jonathan.

JONATHAN BRANDT: McLane's core operating margins have dropped about 50 percent from where they've generally been since acquisition [from Walmart].

Could you elaborate on the competitive pressures in the grocery and convenience store distribution business that have caused the deterioration in profits? And do you expect the margin structure of that business to eventually get back to where it was, or is this the new normal?

WARREN BUFFETT: Well, I don't know the answer to the second part about the future, but there's no question that the margins have been squeezed. They were very, very narrow, as you know, they were about one cent on the dollar pretax, and they have been squeezed from that. Payment terms get squeezed.

In some cases we have fairly long-term contracts on that, so it will go on for five years (inaudible).

It's a very, very tight margin business. And the situation is even worse than you portray because within McLane we have a liquor distribution business in a few states and that business has actually increased its earnings moderately, and we've added to that business, so within McLane's figures there are about 70 million or so pretax from the liquor part that have nothing to do with the massive parts you're talking about, in terms of food distribution.

So it's even - the decline is even greater in what you're referring to than you've (inaudible).

That's just become very much more competitive. We have to decide - if you'll look at our competitors, they're not making much money either. And that's capitalism.

I think, you know, there comes a point where the customer says, you know, "I'll only pay X," and you have to walk away.

And there's a great temptation when you're employing - particularly employing thousands of people - and you've built distribution facilities, and all of that sort of thing - take care of them - to meet what you'd like to term as "irrational competition," but that is capitalism.

And - you're right. We took - the earnings went up quite a bit from the time we bought it. And we're still earning more than then. And we've earned a lot of money over time.

But, as I say, a fair amount of that is actually coming from liquor distribution, activities in about four states that we purchased - very well-run.

And - we will do our best to get the margins up. But I would not - I could not tell you - give you a really - your guess is almost as good as mine, or better than mine, maybe, as to what margins will be in that distribution business five years from now.

It's a very essential service. We do \$40-some billion. And we move more of the product of all kinds of companies that names are known to you, than anybody else. But - when you get - when you get - Kraft Heinz for that matter, or Philip Morris, or whomever it may be, on one side of the deal, and you get Walmart and some other - 7/11 - on the other side of the deal, sometimes they don't leave you very much room in between.

Charlie?

CHARLIE MUNGER: I think you've described it very well. (Buffett laughs)

15. Health care costs partnership with Amazon and JPMorgan

WARREN BUFFETT: OK. (Laughter) Station 4.

AUDIENCE MEMBER: Good morning, Charlie and Warren. I know that seems a little bit out of order, but I'm a huge fan of yours, Charlie, mostly for your 25 Cognitive Biases.

I'm from Seattle, Washington. I run a one-person digital marketing firm that specializes in Facebook ads and email marketing. I use these a lot. I - your breakdown of Coca-Cola was really, really solid.

And I use that as reference when looking to how to understand the mechanics of my clients' products and how to promote them. So I'm fairly certain that your cognitive biases work for internet-related companies.

Now that you're partnering with Amazon [and JPMorgan] on health care, I'm curious, have you started to understand how to apply these biases to internet-related companies? Or is there another set of tools you use to decide if you understand a business? Because you guys talk a lot about not investing in businesses that you don't understand.

WARREN BUFFETT: Well, health care is a - we don't plan to start health care companies or, necessarily, insurers or anything. We simply have three organizations with leaders that I admire and trust. And we - mutually goes around all three.

And we hope to do something which Charlie correctly would probably say is almost impossible to change in some way a system which is - was taking 5 percent of GDP in 1960, and now is taking close to 18 percent.

And we have a hugely noncompetitive medical cost in American business, relating to any country in the world. The countries that - there were some countries that were around our 5 percent when we were at 5 percent. But we've managed to get to 18 without them going beyond 11 or so.

Literally, in 1960, we were spending \$170 per capita on medical costs in the United States. And now we're spending over 10,000.

And, you know, every dollar only has a hundred cents. So there is a cost problem. It is a tapeworm, in terms of American business and its competitiveness.

We don't - we have fewer doctors per capita. We have fewer hospital beds per capita, fewer nurses per capita, than some of the other countries that are well below us.

And you've got a system that is delivering \$3.3 trillion - that's almost as much as the federal government raises - it's delivering 3.3 trillion, or some number like that, to millions and millions and millions of people who are involved in the system. And every dollar has a constituency. It's just like politics.

And whether we can find the chief executive, which we're working on now, and which I would expect we would - we would be able to announce before too long - that - but that's a key part of it.

And whether that person will have the imagination and support of people that will enable us to make any kinds of significant improvements in a system which everybody agrees is sort of out of control on cost, but what - but - but they all think it's the other guy's fault, generally - we'll find out. It won't be - it won't be easy.

But it is not a - the motivations are not primarily profit-making. They're - we want to deliver - we want our employees to get better medical service at a lower cost. We're not going to - we're certainly not going to come up with something where we think the service that they receive is inferior to what they're getting now.

But we do think that there may be ways to make a real - significant changes - that could have an effect. And we know that the resistance will be unbelievable.

And if we fail, we've at least tried. And - but they - the idea is not that I will be able to contribute anything to, you know, in some breakthrough moment, by reading a few medical journals or something - (laughs) - changing something that is as embedded as the medical system.

But the idea is that maybe the three organizations, which employ over a million people and which, after we announced it, we had a flood of calls from people that wanted to join in, but

there isn't anything to join into now. But they will if we have - come up with any ideas that are useful.

Whether we can - bring the resources, bring the person. And the CEO is terribly important. And then bring the person, support that person. And somehow, figure out a better way for people to continue to receive better medical care in the United States without that 8 percent - 18 percent - going to 20 or 22 percent, you know, in the lifetime of, you know, our children or something of the sort - because there are only a hundred cents in the dollar.

And we will see what happens. It's - you know - if you were Ajit [Jain], actuarially figuring, it would not - you would not bet on us. But - I think there is some chance we will do something.

There's a chance - nobody can quantify it - that we can do something significant. And we are positioned better than most people to try. And we've certainly got the right partners. So, we will give it a shot and see what happens.

Charlie? (Applause)

CHARLIE MUNGER: There is some precedent for success in this public service activity. If you go back many decades, John B. Rockefeller I, using his own money, made an enormous improvement in American medical care. Perfectly enormous. In fact, there's never been any similar improvement done by any one man since that rivals it.

So Warren, having imitated Rockefeller in one way, is just trying another. And maybe it'll work.

WARREN BUFFETT: Rockefeller, incidentally, lived a very long time. So I actually am trying to imitate him three ways there. (Laughter)

We'll see what happens. But we are - we're making a lot of progress. And I think we'll probably have a CEO within a couple of months. But if we don't have one, then we're not going to pick somebody just because we want to meet any deadline or anything like that. We've got these wonderful partners.

We don't have a partnership agreement among us. Somebody started drawing up one in a legal department and the CEO just put a stop to it.

They - you do have places that have a lot of resources. And while we all have our share of bureaucracy, we can cut through it if we've got something that we really think makes sense.

And we will get the support - we'll get - we'll get a lot of resistance, too. But we will get the support of a lot of American business, if we come up with something that makes sense.

But if it was easy, it would've already been done. There's no question about that.

CHARLIE MUNGER: It's not easy.

WARREN BUFFETT: No. (Laughs) But it should be tried.

16. Weschler and Combs "slightly ahead" of S&P

WARREN BUFFETT: OK. Becky?

BECKY QUICK: This question comes from David Rolfe, who is with Wedgewood Partners, and has been - the company - has been shareholders in Berkshire since 1989. The stock is currently the largest holding in their stocks - 18 stocks.

He asks this question: "Over the past two years, you have listed the individual fund-of-funds performance from Protégé Partners. When will you start showing the annual performance on 25 billion that Ted [Weschler] and Todd [Combs] manage? Can you state if either Ted or Todd has beaten the S&P 500 index over the last five years?"

WARREN BUFFETT: Yeah. Both - A, we'll probably never report their individual performance.

But you can be sure that I have an enormous interest in - as does Charlie - in how much we think they contribute to Berkshire. And they have - they've been terrific. They've - they not only have the intellect, and the record, but they are exceptional human beings. And they -

Todd has done a tremendous amount of work, for example, on the medical project.

And - Ted is - I've given him several things, and he's done them better than I could do them.

So the record, since inception - and I'm measuring it - Ted came later than Todd, a year or so later - but the record, since inception, is almost identical - both for the two managers - from their different inception and matching the S&P.

And they've received some incentive compensation, which they only get if they beat the S&P. And as I say, they're just slightly ahead. That really hasn't -

It's been better than I've done, so naturally, I can't criticize it. (Laughs)

They - they were the - they were two very, very, very good choices.

Charlie?

CHARLIE MUNGER: You did report it in a previous year. You just didn't do it this year. And - but now you have your report. (Laughter)

WARREN BUFFETT: I would - the problem that all of us has is size. It's actually - it's harder to run even 12 or \$13 billion, frankly, than it is to run a billion. And if you're running a million dollars or something of the sort, it's a whole different game. You'd agree with that, wouldn't you, Charlie?

CHARLIE MUNGER: Of course.

WARREN BUFFETT: Yeah, OK. (Laughter)

Just like any good lawyer, you never ask him a question unless you think you know the answer they're going to give. (Laughter)

17. GEICO is on a good growth and profit track

WARREN BUFFETT: OK. Gary?

GARY RANSOM: My question's on GEICO. Last year, you promised growth and delivered. But along the way, the combined ratio was moving up, and it was the first time it was over a hundred in about 15 years.

Granted, some of that was catastrophes. But even excluding catastrophes, there was something going on in the loss trends that caused you to slow down that growth, at least at the - as we got to the latter part of the year.

And I wondered if you could tell us what was going on. And I did look this morning, too, so it looked like the first quarter has settled down a little bit, but I'd still like to know about the fourth quarter.

WARREN BUFFETT: Yeah, sure. It - the only thing I differ with the question on slightly - when you say it caused us to slow down - we didn't want to slow down the growth. I mean, you're looking at a guy here that has never wanted to slow down the growth of GEICO. The growth did slow down, but it wasn't because we wanted it to.

Our prices that led to the underwriting loss - we actually - we'd have been slightly in the black without the catastrophes.

But, you know, if we hadn't have paid our light bills, we might have been in the black, too. I mean, this "except for" stuff doesn't mean much in insurance as far as I'm concerned.

The - if you'll look at the first quarter - our margins were around 7 percent, which is actually a little more than we aimed for. And I received the unaudited - I mean, the preliminary - figures for April, and they're similar.

So, the underwriting gain is - or margins - are perfectly satisfactory now. And we'd love to get all the growth we can. And we will gain market share this year. And we gained market share - Tony - when Tony [Nicely] took over the place, it was - in 1993 - it was two and a very small fraction percent. And it'll be 13 percent of the - you know - 13 percent of the households in the country now. And we will keep gaining share. We will keep writing profitably - most of the time.

And every now and then, our rates will be slightly - modestly inaccurate - inadequate, I should say. And/or we'll have, maybe, some big losses on hurricanes or something of the sort, or we'll have a [Hurricane] Sandy in New York.

The - but GEICO is a jewel. And it's - you know, it's really a - we've got some others we feel awfully close to similarly about, but it's an incredible company. It has a culture all of its own. It's saving its customers probably 4 or \$5 billion a year against which they would - against what they would otherwise be paying, based on the average in auto insurance. And it will be profitable on underwriting a very high percentage of the year. It contributed another \$2 billion to float last year.

It is a terrific company. And like I say, the first four months are dramatically better.

Now, there's some seasonal in auto insurance. So, the first quarter is usually the best of the four quarters. But it's not a dramatic seasonal. So, I think when you read the 10-Q - and you can take my word for April - I think GEICO is on a good profit track as well as a good growth track. And the more it grows, the better I like it.

Charlie?

CHARLIE MUNGER: Well, I think you've said it perfectly.

WARREN BUFFETT: Huh.

CHARLIE MUNGER: It was never very bad, and it's better now. (Buffett laughs)

18. Munger on steel tariffs: "Even Donald Trump can be right"

WARREN BUFFETT: OK. Station five.

AUDIENCE MEMBER: Good morning, Warren Buffett and Charlie Munger. My name is Ethan Mupposa (PH), and I am from Omaha, Nebraska.

My question is, how will Donald Trump's tariffs affect the manufacturing business of Berkshire Hathaway?

WARREN BUFFETT: Well, to date - (applause) - steel costs - we've seen steel costs increase somewhat. But as I said earlier, I don't think the United States or China - there'll be some

jockeying back and forth, and there will be something that leaves some people unhappy and - but I don't think - I don't think either country will dig themselves into something that precipitates and continues any kind of real trade war in this country.

We - we've had that in the past a few times. And I think we've learned a general lesson on it.

But there will - there will be some things about our trade policies that irritate others. And there will be some from others that irritate us. And there will be some back and forth. But in the end, I don't think we'll come out with a terrible answer on it.

Charlie, I'll let you -

CHARLIE MUNGER: Well, steel has - it reached - the conditions in steel were almost unbelievably adverse to the American steel industry.

You know, even Donald Trump can be right on some of this stuff. (Laughter and applause)

WARREN BUFFETT: The - the thing about trade - you know, I've always said that the president, whether it's president - any president - needs to be an educator-in-chief, which [Franklin] Roosevelt was in the Depression. That's why he had those Fireside Chats, and it was very important that he communicated to the people what needed to be done and what was happening around them, and -

Trade is particularly difficult, because the benefits of trade are basically not visible, you know. You don't know what you would be paying for the clothes you're wearing today if we'd had a rule they all had to be manufactured in the United States, or what you'd be paying for your television set, or whatever it may be.

No one thinks about the benefits day-by-day as they walk around buying things and carrying on their own business.

The negatives, and there are negatives, are very apparent and very painful. And if you're laid off - like happened in our shoe business [Dexter Shoes] in Maine - and you know you are - been a very, very, very good worker, and you were proud of what you did, and maybe your parents did it before you, and all of a sudden you find out that American shoes - shoes manufactured in America - are not competitive with shoes made outside the United States.

You know, you can talk all you want about Adam Smith or David Ricardo or something and explain the benefits of free trade and comparative advantage and all that sort of thing, and that doesn't make any difference.

And if you're 55 or 60 years old, to talk about retraining or something like that, you know, so what?

So, I - it is tough in politics where you have a hidden benefit and a very visible cost to a certain percentage of a - of your constituency.

And you need to do two things under those circumstances, if you have that situation. You know what's good for the country. So, you have to be very good at explaining how it does really hurt, in a real way, somebody that works in a textile mill, like we had in New Bedford, where you only spoke Portuguese - half our workers only spoke Portuguese. And suddenly, they have no job. And they've been doing their job well for years.

You've got to do two things. You can - you'll have to - you have to understand that that's the price individuals pay for what's good for the collective good.

And secondly, you've got to take care of the people that are - that - where retraining is a joke because of their age, or whatever it may be. And you've got to take care of the people that become the roadkill in something that is collectively good for us as a country. And -

That takes society acting through its representatives to develop the policies that will get us the right collective result, and not kill too many people economically in the process. And you know, we've done that in various arenas over the years.

The people in their productive years do help take care of the people that are too old, and too young. I mean, every time a baby is born in the United States, you know, we take on an obligation of educating them for 12 years. It'll cost \$150,000 now, you know? It -

We have a system that has a bond between the people in their productive years and the ones in the young and old. And it gets better over time. It's far from perfect now. But it has gotten better over time.

And I believe that trade, properly explained, and with policies that take care of the people that are roadkill, is good for our country and can be explained.

But I think it's a tough - it's been a tough, tough sell to a guy that made shoes in Dexter, Maine or worked on a loom in New Bedford, Mass, or works in the steel mill in Youngstown, Ohio.
(Applause)

19. Buffett won't impose his political opinions on Berkshire

WARREN BUFFETT: Andrew?

ANDREW ROSS SORKIN: OK, Warren. This question comes from a Berkshire shareholder who says they've been a shareholder for ten years. I should say this may be one of the most pointed questions I've ever received for you. So -

WARREN BUFFETT: But you elected to give it, though.

ANDREW ROSS SORKIN: But I did. (Laughter)

The shareholder writes, "I have watched the movie every year at this meeting, when you testify in front of Congress on behalf of Salomon, as the symbol of what it means to have a moral compass. Investors are increasingly looking to invest in companies that are socially and morally responsible.

"So I was disturbed when you were asked on CNBC about the role that business could play in sensible policies around the sales of guns.

"You said you didn't think business should have a role at all, and you wouldn't impose your values on others. I was even more surprised when you said you'd be OK with Berkshire owning shares in gun manufacturers.

"At this meeting years ago, you said you wouldn't buy a tobacco company because of the social issues. The idea that Berkshire would associate with any company as long as it isn't illegal seems at odds with everything I think you stand for. Please tell us you misspoke."

WARREN BUFFETT: Well - (applause) - let's explore that a little. (Laughter)

Should it be just my view, or should it be the view of the owners of the company? So, if I decide to poll the owners of the company on a variety of political issues, and one of them being whether, you know, Berkshire Hathaway should support the NRA, I don't - if a majority of the shareholders voted to do it, or if a majority of the board of directors voted to do it, I would - I wouldn't - I would accept that.

I don't think that the - my political views - I don't think I put them in a blind trust at all when I take the job. And I - in the elections of 2016, I raised a lot of money. In my case, I raised it for Hillary [Clinton]. And I spoke out in various ways that were quite frank, but - (applause) - I don't think that I speak -

When I do that, I don't think I'm speaking for Berkshire. I'm speaking as a private citizen. And I don't think I have any business speaking for Berkshire. We have never - at the parent company level - we have never made a political contribution, you know -

And I don't go to our suppliers. I don't do anything of that sort where I raise money either for the school I went to, or for a political candidate I went to, or anything else.

And I don't think that we should have a question on the GEICO policyholder form, "Are you an NRA member?" you know, and if you are, you just aren't good enough for us, or something. That - I think -

I do not believe in imposing my political opinions on the activities of our businesses.

And if you get to what companies are pure and which ones aren't pure - (applause) - I think it is very difficult to make that call. Thank you.

I think with that response, I'm almost afraid to call on Charlie. But go ahead, Charlie. (Laughter)

CHARLIE MUNGER: Well, obviously, you do draw a limit, Warren -

WARREN BUFFETT: Yeah, we did.

CHARLIE MUNGER: - in all kinds of thing -

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: - which are beneath us, even though they're legal. But we don't necessarily draw it perfectly because we've got some sort of supreme knowledge. We just do the best we can.

And certainly, we're not going to ban all guns, surrounded by wild turkeys in Omaha. (Laughter)

20. "Very unlikely" Berkshire would pay a special dividend

WARREN BUFFETT: OK, Gregg. (Laughter)

GREGG WARREN: Warren, this question's also based on something you said more recently, so I can't guarantee it's going to be any easier. (Buffett laughs)

You recently noted that you prefer share repurchases over dividends as a means for returning capital to shareholders should Berkshire's cash balances continue to rise and hit the \$150 billion threshold you noted as being difficult to defend to shareholders at last year's annual meeting.

While I understand the rationale for not establishing a regular dividend, a one-time special dividend could be a useful option for returning a larger chunk of Berkshire's excess capital to shareholders without the implied promise to keep paying a regular dividend forever.

The drawback with the special dividend, though, is that it would lead to an immediate decline in book value and book value per share. Whereas a larger share repurchase effort, while depressing book value, would reduce Berkshire's share count, limiting the impact on book value per share.

If we do happen to get a few years out and Berkshire does hit that \$150 billion threshold, because valuations continue to be too high, both for acquisitions and for the repurchase of company stock, would you consider a one-time special dividend as a means for returning capital to shareholders?

WARREN BUFFETT: Well, if we thought we couldn't use capital effectively, we would figure - we would try to figure out the most effective way of returning capital to shareholders. And - you could - I would have probably - I think it'd be unlikely we'd do it by a special dividend.

I think it'd be more likely we'd do it by a repurchase, if the repurchase didn't result in us paying a price above intrinsic value per share. We're never going to do anything that we think is harmful to continuing shareholders.

So if we think the stock is intrinsically worth X, and we would have to pay some modest multiple even above that to repurchase shares, we wouldn't do it because we would be hurting continuing shareholders to the benefit of the people who are getting out.

But we will try and do whatever makes the most sense, but not with the idea that we have to do something every day because we simply can't find something that day.

We had a vote as you know - I don't know, a few years back - on whether people wanted a dividend. And - the B shares - so I'm not talking my shares or Charlie's or anything - but the B shares voted 47 to one against it.

So I think through self-selection of who become shareholders - I don't think shareholders world - or countrywide - on all stocks would vote 47 to one at all.

But we get self-selection in terms of who joins us. And I think they expect us to do whatever we think makes sense for all shareholders. And obviously, if we really thought we never could use the money effectively in the business, we should get it out, one way or another. And -

You've got a bunch of directors who own significant - very significant - amounts of stock themselves. And you can expect them to think like owners. It's the reason they're on the board.

And you can expect the management to think like owners and - owners will return money to all of the owners if they think it makes more sense than continuing to look for things to do.

But we invested in the first quarter, maybe - have to look it up on the - well, certainly through April - probably close to 15 billion or something like that, net, so -

And we won't always be in a world of very low interest rates - or high private market prices.

So we will do what makes the most sense. But I can't see us ever making a special - almost - it's very unlikely we would just pay out a big, special dividend. I think that if we put that to the vote of the shareholders, and Charlie and I did not vote, I think we would get a big negative vote. And I'd be willing to - be willing to make a bet on that one.

Charlie?

CHARLIE MUNGER: Well, as long as the existing system continues to work as well as it has, why would we change it? We've got a whole lot of people that are accustomed to it, have done well under it. And if conditions change, why, we're capable of changing our minds, if the facts change.

WARREN BUFFETT: Yeah, and we've done that several times.

CHARLIE MUNGER: Yes.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Although, I must say, it's a little hard. (Laughter)

WARREN BUFFETT: He always brings me back to earth.

21. Munger is more interested than Buffett in Chinese stocks

WARREN BUFFETT: OK. Station 6?

STEPHANIE YU: Hi, good morning, Mr. Buffett and Mr. Munger. My name is Stephie Yu from Horizon Insights, a China-focused research firm based in Shanghai. So I have a lot of mutual fund clients in China, who are very young - relatively younger - and they manage a smaller portion of funds.

So my question is, if you only have \$1 billion in your portfolio today, how would you change your investments? Would you consider more investment opportunities in emerging markets such as China? Thank you.

WARREN BUFFETT: Yeah. I would say, if I were working with a billion, I would probably find - within a \$30 trillion market in the United States, where I understood things better, generally, than I do around the world - I'd probably find opportunities there that would be better, incidentally, by some margin, than what we can find for hundreds of billions.

But I wouldn't - there's no way I'd rule out emerging markets. There was a time, 15 years ago or so, when just because it was kind of interesting and it took me back to my youth, I - on the weekend, I went through a directory of Korean stocks. And I bought - and these were small stocks - well, they weren't small by standards of either Korean or American business. They were big, big companies.

But I found 15 or 20 in - that were statistically cheap and bought some of each one myself.

And there are opportunities with smaller amounts of money to do things that we just can't do. And - but I - my first inclination always would be to comb through things in the United States. And -

But I've combed through - in other countries. I probably wouldn't get into very, very small markets because there can be a lot of difficulties even in market execution and taxation, (inaudible).

You can find - if you can't find it, you know, in America and China and Britain and a few other places - (laughs) - you probably aren't going to find it someplace else. You may think you've found it. But that may be - it may be a different game than you know. Our problem is size, not geography.

Charlie?

CHARLIE MUNGER: Well, I already have more stocks in China than you do, as a percentage, so I'm with the young lady. (Laughter)

WARREN BUFFETT: OK. Well, you can - you want to name names? Do these stocks have names? Or - (Laughs)

CHARLIE MUNGER: No, I don't. (Buffett laughs)

WARREN BUFFETT: Carol?

CAROL LOOMIS: This question is -

WARREN BUFFETT: I should just add one thing. You will find plenty of opportunities in China. Charlie would say you've got a better hunting ground than even a person with similar capital in the United States. Would you agree with -?

CHARLIE MUNGER: Yes, I do.

WARREN BUFFETT: Yeah, yeah. So - and in the sense they're - it's logical that should be the case because it's a younger market, but still a large market. So that -

Markets probably work toward efficiency as they age. Japan had this very strange situation with warrants being priced out of line and all of that 30 years ago. And people notice after a while and it disappears. But there can be - some very strange things happen in markets as they develop. I think you'd agree with that, Charlie, wouldn't you?

CHARLIE MUNGER: Absolutely.

WARREN BUFFETT: Yeah.

22. Munger: Keep the faith and don't sell your stock when we're gone

WARREN BUFFETT: Jonathan?

JONATHAN BRANDT: Hello -

CAROL LOOMIS: You skipped me.

WARREN BUFFETT: Did I skip -? I skipped Carol?

CAROL LOOMIS: Yup.

WARREN BUFFETT: Oh. I'm sorry.

CAROL LOOMIS: OK.

WARREN BUFFETT: OK.

CAROL LOOMIS: This question, and I would concede it is not a small one, comes from Gideon Pollack of Montreal.

He says, "The world knows generally how the looks of Berkshire Hathaway have changed since you began to run the company in 1965. Berkshire was then a tiny northeastern, textile company. And now it is the number-four company on the Fortune 500.

"What about the next 50 years? Could you give us your view of what Berkshire looks like in 2068?"

WARREN BUFFETT: I think it'll look a long way away. (Laughter)

No, the answer is I don't know. And I didn't know, 50 years ago, what it would like now, I mean -

It will be based on certain principles. But where that leads, you know, we will find out and we'll have people that are thinking about different things than I am. And we'll have a world that's different. But -

We will be - I very much hope and believe that we will be - that we'll be as shareholder-oriented as any large company in the world. We will look at our shareholders as partners and we will be trying to do with their money exactly what we'd do with our own, not seeking to get an edge on them. And who knows what else will be happening then?

Charlie?

CHARLIE MUNGER: Well, I want to talk to the younger shareholders in the group. Those of you who, after we are gone, sell your Berkshire stock and do something else with it, helped by your many friends, I think are going to do worse. (Laughter)

So I would advise you to keep the faith. (Applause)

By the way, some of that has already happened in many families.

WARREN BUFFETT: I'll give his answer next time now that I see it get all of that applause.

(Laughter)

23. "Duracell should be earning more money than it is now"

WARREN BUFFETT: Jonathan.

JONATHAN BRANDT: Duracell's \$82 million of pretax profits in 2017 were still well below what it earned as a subsidiary of P&G. Can you clarify or quantify to what extent transition costs or purchase price accounting impacts at the segment level were still temporarily burdened last year? Or is it possible that the gap in earnings contribution simply reflects a commoditization of the category given the entry of Amazon into the battery market?

I did see that Duracell's earnings were up in the first quarter. Is that a sign of a more meaningful contribution in 2018 and beyond, as you finish right-sizing the manufacturing footprint and acquisition-related charges fall away?

WARREN BUFFETT: Yeah. Duracell should be earning more money than it is now, and will be. And as you mentioned, it's well on its way there. But it is not earning an appropriate amount now, based on the history of the company.

I was around when - I was on the board of Gillette when Gillette bought Duracell. And I've seen what it does when it is managed to its full extent. And I saw what Jim Kilts did with it at Gillette when he ran it. And there were a lot more transition problems in the purchase. For one thing, there's a lot of rules connected with our swap of our stock in P&G for Duracell. There are a lot of things which you cannot do that made sense to do in that period of transition from P&G's management to ours. But Duracell - the brand is strong. Very strong.

The product line is very strong. And we are making more money. And we should, and I believe we will earn, really, what the property is capable of earning. We should be earning that relatively soon.

But you're absolutely right that it is - from a profit standpoint - is underperforming.

We're making a lot of changes. And some of those are involved in jurisdictions - countries - where it is really expensive to change in terms of employment - payments that have to be made if a plant is changed or something of the sort.

But I like the Duracell deal absolutely as well as when we made it.

Charlie?

CHARLIE MUNGER: I like it better than you do. (Laughter)

WARREN BUFFETT: No. Duracell is a very, very - is our kind of business.

CHARLIE MUNGER: It is.

24. Long-term bonds are “almost ridiculous” at current rates

WARREN BUFFETT: OK. Station 7.

AUDIENCE MEMBER: Good morning. And I have a question related to the bond market - U.S. Treasury bond market. And my name is Ola Larsson (PH). I live in the San Francisco bay area.

And I never worked in the financial industry. I started out buying penny mining stocks on the Vancouver Stock Exchange. And then decades later, I got married. And my wife convinced me to buy Berkshire shares. That was probably a good decision. (Laughter)

So my question is, I read the newspapers about the Federal Reserve and the inflation numbers. And there must be an increase supply of Treasury bonds that must go to auction. And my question is how would - what do you expect that to impact yield or interest rate?

WARREN BUFFETT: Yeah. The answer is, I don't know. And the good news is, nobody else knows, including members of the Federal Reserve and everyone -

There are a lot of variables in the picture. And the one thing we know is we think that long-term bonds are a terrible investment, and we - at current rates or anything close to current rates.

So basically all of our money that is waiting to be placed is in Treasury bills that, I think, have an average maturity of four months, or something like that, at most.

The rates on those have gone up lately, so that in 2018, my guess is we'll have at least \$500 million more of pretax income than we would've had in the bills last year.

But they still - it's not because we want to hold them. We're waiting to do something else.

But long-term bonds - they're basically, at these rates - it's almost ridiculous when you think about it. Because here the Federal Reserve Board is telling you we want 2 percent a year inflation. And the very long bond is not much more than 3 percent. And of course, if you're an individual, then you pay tax on it. You're going to have some income taxes to pay.

And let's say it brings your after-tax return down to 2 1/2 percent. So the Federal Reserve is telling you that they're going to do whatever's in their power to make sure that you don't get more than a half a percent a year of inflation-adjusted income.

And that seems to me, a very - I wouldn't go back to penny stocks - but I think I would stick with productive businesses, or productive - certain other productive assets - by far.

But what the bond market does in the next year, you know - you've got trillions of dollars in the hands of people that are trying to guess which maturity would be the best to own and all that sort of thing. And we do not bring anything to that game that would allow us to think that we've got an edge.

Charlie?

CHARLIE MUNGER: Well, it really wasn't fair for our monetary authorities to reduce the savings rates, paid mostly to our old people with savings accounts, as much as they did. But they probably had to do it to fight the Great Recession, appropriately.

But it clearly wasn't fair. And the conditions were weird. In my whole lifetime, it's only happened once that interest rates went down so low and stayed low for a long time.

And it was quite unfair to a lot of people. And it benefited the people in this room enormously because it drove asset prices up, including the price of Berkshire Hathaway stock. So we're all a bunch of undeserving people - (laughter) - and I hope that we continue to be so. (Laughter)

WARREN BUFFETT: At the time this newspaper came out in 1942, it was - the government was appealing to the patriotism of everybody. As kids, we went to school and we bought Savings Stamps to put in - well, they first called them U.S. War Bonds, then they called them U.S. Defense Bonds, then they called them U.S. Savings Bonds. (Laughs) But they were called war bonds then.

And you put up \$18.75 and you got back \$25 in ten years. And that's when I learned that that \$4 for three - in ten years - was 2.9 percent compounded. They had to put it in small print then.

And even an 11-year-old could understand that 2.9 percent compounded for ten years was not a good investment. But we all bought them. It was - you know, it was part of the war effort, basically.

And the government knew - I mean, you knew that significant inflation was coming from what was taking place in finance, in World War II.

We actually were on a massive Keynesian-type behavior, not because we elected to follow Keynes, but because war forced us to have this huge deficit in our finances, which took our debt up to 120 percent of GDP. And it was the great Keynesian experiment of all time, and we

backed into it, and it sent us on a wave of prosperity like we've never seen. So you get some accidental benefits sometimes.

But the United States government (inaudible) every citizen to put their money into a fixed-dollar investment at 2.9 percent compounded for ten years. And I think Treasury bonds have been unattractive ever since - (laughs) - with the exception of the early '80s. That was something at that time.

I mean, you really had a chance to buy - you had a chance to invest your money by buying zero-coupon Treasury bonds, and in effect, guarantee yourself that for 30 years you would get a compounded return, you know, something like 14 percent for 30 years of your lifetime.

So every now and then, something really strange happens in markets and the trick is to not only be prepared but to take action when it happens.

Charlie, did you ever buy any war bonds?

CHARLIE MUNGER: No. No. I never bought war bonds.

WARREN BUFFETT: No. Used to be like take me -

CHARLIE MUNGER: I didn't have any money when I was in the war. (Laughter)

WARREN BUFFETT: That's a good reason not to buy. (Laughs)

25. "A bureaucracy is sort of like a cancer"

WARREN BUFFETT: OK, Becky?

BECKY QUICK: This question comes from Angus Hanton (PH), who - he and his wife are based in London, and he says they've been shareholders in Berkshire Hathaway for over 30 years.

He says, "We have all read about the zero-based budgeting that has been so effective with Kraft Heinz and other investments that you've done with 3G Partners. Can we expect these cost-reduction techniques to be used by your managers in other parts of the Berkshire Hathaway enterprise?"

WARREN BUFFETT: Well, in general, we do not expect the managers, generally, to get in the position where there would be a lot of change in terms of zero-based budgeting. In other words, why in the world aren't you thinking that way all of the time?

The 3G people have gone into certain situations where there were - probably primarily in personnel, but in other expenses as well - a lot of expenses that were not delivering a dollar of value per dollar expended.

And so, they made changes very fast that - to a situation that probably shouldn't have existed in the first place.

Whereas, we hope that our managers - take a GEICO. GEICO's gone from, I think, 8,000 to 39,000 people since we bought control. But they're all very productive. I mean, you would not find a way for a 3G operation to take thousands of people out of there.

On the other hand, I can think of some organizations where you could take a whole lot of people out, where it isn't being done because the businesses are very profitable to start with.

That's what happened with the tobacco companies, actually. They were so profitable that they had all kinds of people around that didn't - weren't really needed. But they - the money just flowed in.

So I - our managers have different techniques of keeping track of - or of - trying to maximize customer satisfaction at the same time that they don't incur other than necessary costs.

And I think, probably, some of our managers may well use something that's either zero-based budgeting or something akin to it. They do not submit budgets - never have - to me. I mean, they've never been required to. We've never had a budget at Berkshire.

We don't consolidate our figures monthly. I mean, I get individual reports on every company. But there's no reason to have some extra time spent, for example, by having consolidated figures at the end of April, or consolidated figures at the end of May.

We know where we stand. And - you know, I'm sure we're the only company that - probably in the whole Fortune 500 - that doesn't do it. But we don't do unnecessary things around Berkshire. And a lot of stuff that's done at big companies is unnecessary. And that's why a 3G finds opportunities from time to time.

Charlie?

CHARLIE MUNGER: Well, if you've got 30 people at headquarters and half of those are internal auditors, that is not the normal way of running a big company in America.

And what's interesting about it is, obviously, we lose some advantages from big size. But we also lose certain disadvantages from having a big bureaucracy with endless meeting after meeting after meeting around headquarters.

And net, I think we've been way ahead with our low overhead, diversified method. And also, it makes our company attractive to very able, honorable people who have companies.

So generally speaking, the existing system has worked wonderfully for us. I don't think we have the employment that could be cut effectively that a lot of other places have. And I think our methods have worked so well that we'd be very unlikely to change them.

WARREN BUFFETT: Yeah. I think if some - at headquarters, you could say we have kind of subzero-based budgeting. (Laughter)

And we hope that the example of headquarters is, to a great extent, emulated by our -

CHARLIE MUNGER: But it isn't just the cost reduction. I think the decisions get made better if you eliminate the bureaucracy.

WARREN BUFFETT: Oh yeah.

CHARLIE MUNGER: I think a bureaucracy is sort of like a cancer. And it functions sort of like a cancer. (Applause)

And so, we're very anti-bureaucracy. And I think it's done us a lot of good. In that case, we're quite different from, say, Anheuser-Busch at its peak.

26. We're experimenting with lower-cost commercial insurance

WARREN BUFFETT: OK. Gary.

GARY RANSOM: My question is on small commercial, and specifically, direct small commercial.

You seem to have some websites that enable buyers to purchase small commercial insurance directly; biBERK is one of them.

It's a very competitive, fragmented market. But what is your strategy for that market? And then, can you ultimately GEICO-ize the small commercial market?

WARREN BUFFETT: Well, we'll find out. I mean, it's a very good question because that's exactly the question we ask ourselves.

And we have this incredible company at GEICO, which has gone direct in the personal auto field, and was, you know, first started it in 1936.

And there's no question in my mind that over a lot of years - and maybe not so many years - something like small commercial - anything that takes cost out of the system, you know, makes it easier for the customer, is going to work over time, if you've got a system that was based on something that had more layers of agency costs and that sort of thing.

So we are experimenting, and we'll continue to experiment, on something like small commercial, workers' comp, whatever it may be. We'll try and figure out ways to take cost out of the system, offer the customer an equivalent product or better at lesser price, and we'll find out what can be done and what can't be done.

And we're not the only ones doing it, as you know. But we are not going - we've got some managers that are going to be quite, I'm sure, enterprising on that. And we back them. And we expect some to fail and some - and if a few succeed - we'll have some very good businesses. And the world is going in that direction. So - you could expect us to try and go with it.

Charlie?

CHARLIE MUNGER: Well, if it were easy, I think it would've happened more fast -

WARREN BUFFETT: Yeah -

CHARLIE MUNGER: - than it has.

WARREN BUFFETT: It will happen as we go along. I mean, it wasn't easy in auto, I mean, when you think about it.

CHARLIE MUNGER: No, it wasn't.

WARREN BUFFETT: No. I mean, it was a system with all kinds of extra costs that go back to the turn of the 19th century into the 20th. I mean, it was built on fire insurance and strong general agencies. And that slopped over into auto when the auto came along in 1903 from Ford or whenever. And - so it grew within a system that really wasn't very efficient compared to what was available.

But it took State Farm initially to go to a direct, or a captive agency system. And then it took USAA, and then later, GEICO, and then later, Progressive, to go to direct systems that are even more efficient and consumer-friendly.

And the same thing is going to happen, to some degree, in all kinds of industries, and certainly small commercial - somebody will -

CHARLIE MUNGER: It could happen, but it will be slow.

WARREN BUFFETT: It takes an amazingly long time. I mean, it - but you know, the battle doesn't always go to the strong and the race to the swift. But that's the way to bet, you know, as they say. So - (Laughs)

27. Health care partnership is attacking a huge "industry moat"

WARREN BUFFETT: OK, station eight?

AUDIENCE MEMBER: Austin Merriam, from Jacksonville, Florida.

Mr. Buffett, with the recent news of the partnership between you, Mr. [Jeff] Bezos, and Mr. [Jamie] Dimon, to challenge the health care industry and the self-admitted difficulties you are running across, this would lead me to believe the industry has higher barriers to entry than may have originally been hypothesized; a larger moat, if you will.

Would that justify a higher earnings multiple for established players in the industries, such as PBMs, for example?

WARREN BUFFETT: Well, just - though the system may have a moat against intruders, it doesn't mean that everybody operating within the system has individual moats, for one thing.

Now, I - we are - if this new triumvirate succeeds at all, we are attacking an industry moat. And I'm defining industry very broadly; health care, not just, you know, health care insurers or this or that.

We're trying to figure out a better way of doing it and making sure that we're not sacrificing care. And the goal is to improve care.

And like I say, that is a - that's a lot bigger than a single company's moat. It's bigger than a component of the industry's moat. The moat held by the whole system, since it interacts in so many ways, is actually - that's the moat that essentially has to be attacked, and that's a huge moat.

And like I say, we'll do our best. But - I hope if we fail, I hope somebody else succeeds.

Charlie?

CHARLIE MUNGER: Well, I suspect that eventually when the Democrats control both houses of Congress and the White House, we will get single-payer medicine. And I don't think it's going to be very friendly to many of the current PBMs. (Applause)

And I won't miss them. (Laughter)

28. Buffett vs Elon Musk on whether competitive moats are "lame"

WARREN BUFFETT: Andrew?

ANDREW ROSS SORKIN: This question comes from Kiwi (PH) and actually is directly about the issue of moats.

He notes that - "Elon Musk, this week, on his Tesla earnings call, said the following, quote, 'I think moats are lame. They are, like, nice in a sort of quaint, vestigial way. And if your only defense against invading armies is a moat, you will not last long. What matters is the pace of innovation. That is the fundamental determinant of competitiveness,' unquote.

"So, Warren, it seems the world has changed. Business is getting more competitive. Pace of innovation. Technology is impacting everything. Is Elon right?"

CHARLIE MUNGER: Let me answer that one, Warren.

Elon says a conventional moat is quaint. And that's true of a puddle of water. And he says that the best moat would be to have a big competitive position. And that is also right. You know, it's ridiculous. (Laughter)

Warren does not intend to build an actual moat. (Laughter)

Even though they're quaint.

WARREN BUFFETT: Yeah. (Laughter)

There's certainly a great number of businesses - this has always been true, but it does seem like it - the pace has accelerated and so on, in recent years. There's been more moats that have been - become susceptible to invasion - than seemed to be the case, earlier. But there's always been the attempt to do it.

And there - here and there, there are probably places where the moat is as strong as ever. But certainly - you could work at - certainly should be working at improving your own moat and defending your own moat all of the time. And then - Elon may turn things upside down in some areas.

I don't think he'd want to take us on in candy. But - (Laughter)

And we've got some other businesses that wouldn't be so easy to -

You can look at something like Garanimals out there in the other room. And - it won't be technology that takes away the business in - (laughs) - Garanimals. Maybe something else that catches the young kid's fantasy or something.

But - there are some pretty good moats around. Being the low-cost producer, for example, is a terribly important moat. And something like GEICO - technology has really not brought down the cost that much. I think our position as - there is a couple of companies that have costs as low as ours. But among big companies, we are a low-cost producer, and that is not bad when you're selling an essential item.

29. Not surprised “if we find good uses” for Berkshire Hathaway Energy’s capital

WARREN BUFFETT: OK, Gregg?

GREGG WARREN: Warren, Berkshire Energy has benefited greatly from operating under the Berkshire umbrella. By not having to pay out 60 to 70 percent of earnings annually as a dividend, the company was able to amass 9 billion in capital the past five years, and closer to 12 billion in the past ten, money that can be allocated to acquisitions and capital spending, especially on renewables.

While tax credits for solar energy don’t run out until next year, we’ve already seen a dramatic reduction in Berkshire Energy’s capital commitment to solar projects. And even though spending on wind generation capacity is projected to be elevated this year and next, it does wind down in 2020 as the wind production tax credits are phased out.

Absent a major commitment to additional capital projects, it looks like Berkshire Energy’s expenditures in 2021 will be its lowest since 2012, leaving the firm with more cash on hand than it has had in some time.

Do you think it is likely at that point that Berkshire Energy starts funneling some of that cash up to the parent company? Or will it be earmarked for debt reduction, or just be left on the balance sheet as dry powder for acquisitions?

WARREN BUFFETT: Yeah. The - you’re right about when tax credits phase out and all of that. Although, as you know, they’ve extended that legislation in the past. Who knows exactly what the government’s position will be on incentivizing various forms of alternative energy?

But my guess is - I mean, if you take the logical expenditures that may be required in all aspects of the public - like regeneration and the utility business generally - I think there’ll be a lot of money spent.

And the question is whether we can spend it and get a reasonable return on it. There again, we’ll do what’s logical.

There are three shareholders, basically, of Berkshire Hathaway Energy. Berkshire Hathaway itself owns 90 percent of it. And Greg Abel and his family, perhaps, and Walter Scott and, again, family members - own the other 10 percent. And we all have an interest in employing as much capital as we can at good rates.

And we’ll know when it can be done and when it can’t be done. And we’ll do - there’s no tax consequences to Berkshire at all. So - but the three partners will figure out which makes the most sense.

But when you think of what might be done to improve the grid in the U.S. and the fact that we do have the capital, I wouldn't be surprised if we find good uses for capital in Berkshire Hathaway Energy for a long time in the future.

Charlie?

CHARLIE MUNGER: Yeah. Well, I think there'll be huge opportunities in Berkshire Energy as far ahead as you can see to deploy capital very intelligently. So I think the chances of a big dividend is approximately zero.

WARREN BUFFETT: Yeah. And we've not only got the money to an extent that virtually no utility company does - we've also got the talent, too. I mean, we've got a very, very talented organization there.

So it's a big field and we've got shareholders that are capitalists. And we've got managers that are terrific. And you would think we'd find something intelligent to do over time in the field.

So far, we have. I mean, we've owned it now for close to 20 years. And we've deployed a lot of capital and so far, so good. I mean, it's -

If you look at the improvements that can be made in our utility system in the United States, you're talking hundreds and hundreds and hundreds of billions of dollars, if not trillions. So - you know, where else but Berkshire would you look for that kind of money? (Laughs)

30. "We do expect that normalized earning power to increase over time"

WARREN BUFFETT: OK, station 9.

AUDIENCE MEMBER: I'm Richard Sercer (PH) from Tucson, Arizona.

"At Berkshire what counts most are increases in our normalized per-share earning power." That was in your last letter. What is our normalized per-share earning power, as you estimate it?

WARREN BUFFETT: Well, I would say that what you saw in the first quarter, under these tax rates, would probably be a reasonable guess. You know, obviously, it depends on the economy in any given year. I would say that would - is a reasonable estimate.

But we have firepower we haven't used. And we'll have more firepower as we go along. So we do expect that normalized earning power to increase over time. And if it doesn't, you know, one way or another, we're failing you because we're retaining those earnings.

So - I don't see anything abnormal in our earnings, figured now at a 21 percent federal rate. But as I look at the 5 1/4 billion in the first quarter - seasonally, insurance is better in the first

quarter - but seasonally, most of our businesses, the first quarter is not the strongest quarter for us. I don't see anything abnormal with it.

And then I think you can expect, you should expect, we expect, substantial capital gains over time in addition to what comes from the operating businesses.

So how much you figure in for that - I would say that the retained earnings beyond dividends of our 770 billion of equities - in other words, how much they're keeping from us, but that our share of the earnings, which can be used by them, whether it's Apple or American Express or Coca-Cola or Wells Fargo or whatever, our share, you know, is in many billions of dollars annually. And one way or another, we think that those dollars will benefit us as much as if they had been paid out.

Now, in certain cases, they won't. But in certain cases, they'll excel the amount, in terms of market value created.

So there's many billions of dollars we are not showing in our earnings that is being retained by our investees. And one way or another, I think we'll get value received out of those.

So you can take 20 or 21 billion under present tax rates, present economic conditions, and then we should get something from that and we should get more when we get 100 billion of cash invested. And we should get more as we retain the earnings. So we hope it adds up to a bigger number as we go along.

Charlie?

CHARLIE MUNGER: Well, I don't think our shareholders are going to see another increase in net worth of \$65 billion in a single year. They may have to wait a while for another. But I don't think that - I think eventually there - another will come, and then another. Just be patient. (Laughter)

WARREN BUFFETT: We don't regard the present situation as, you know, as disadvantageous, except we'd like to get more money out. But we like the businesses we have. We like the businesses that we own part of. We are not reflecting - in the way we look at earnings - the dividends we get from those partially-owned companies falls far short of what they're going to contribute, in our view, to Berkshire's overall earnings over time. We wouldn't own those stocks otherwise. So -

CHARLIE MUNGER: And you also like the Apple and airline stocks you've recently purchased better than the cash you parted with.

WARREN BUFFETT: Absolutely. Yeah.

CHARLIE MUNGER: And that's quite a lot.

WARREN BUFFETT: Yeah, yeah, yeah. OK. We won't pursue that further. Carol? (Laughter)

31. No "unusual profits involved in being a real estate agent"

CAROL LOOMIS: This question is from Daniel Kane (PH) of Atlanta.

"Your annual letter this year pointed out that Berkshire has become a leader in real estate brokerage in the United States. Congratulations. That is a significant feat in less than 20 years.

"But let me mention a sticky point. If fees charged by stock market active managers are a drag on investor performance, I would argue that real estate commissions are no different, and perhaps more detrimental, especially when one considers the lifetime effects of large, forgone, upfront cash flows and the power of compounding interest. I would be pleased to hear your rejoinder on the points I've raised."

WARREN BUFFETT: Well, the purchase of a home is the largest financial transaction, for a significant percentage of the population, that they make. And - people - a lot of people need a lot of attention. And you can show a lot of houses before you sell one.

I would say this. If you look at our close to 50,000 agents now, I think they make a good living - or a decent living. But I would say that that people who manage money make a whole lot more money with perhaps less contribution to the welfare of the person that they are dealing with.

So I don't think that there are unusual profits involved in being a real estate agent. I don't think there are unusual profits involved in the ownership. We like it because it's fundamentally a good business.

But here we are, doing 3 percent of all the real estate transactions in the United States, and we're making, maybe, \$200 million a year - which - well, we won't get into what the comparative efforts are in Wall Street to earn \$200 million. But -

I think I have to tell them about Roy Tolles a little bit on this. Roy Tolles, for example - Charlie's partner - many, many, many years ago, decided he was going to want to buy a house in San Marino. He's going to have a number of kids.

So he sent his wonderful wife, Martha, out. And for six months, he had her look at houses in San Marino. And this was many years ago. And if they were priced at 150,000, she would offer (inaudible), or offer 75,000. And of course, the real estate agents were going crazy because they're never going to get something listed at 150 sold at 75.

And then finally, when she found one that they both really liked, he had her offer something like 120 and the real estate was so happy to get a bid that was in the general area - (laughs) - of the offering price that he would work very hard on the seller to take that bid. Because he knew

what - (laughs) - he did not want six more months of Roy bidding at the lower prices. So you don't sell them on the first trip.

Incidentally, I had Roy buy a house for me, sight unseen, because this was a guy that - (laughs) - knew human nature.

You don't get rich - real estate agency - you know, the people earn their money, and they earn it in a perfectly respectable and honorable manner in terms of what they get paid. And as in every single industry there is, you know, there can be excesses or mistakes or that sort of thing.

But we will continue to buy more brokers. In fact, we'll probably have another couple to announce before long.

And we will feel that if we get to where we're doing 10 percent of the real estate brokerage business in the country and we're making 6- or \$700 million a year, pretax, we will not think that's a crazy amount of money to make for enabling 10 percent of 5 million people to change their homes every year in the United States.

Charlie?

CHARLIE MUNGER: Well, the commissions in real estate may get unreasonable if you're talking about \$20 million houses. It seems a little ridiculous to pay a 5 percent commission on a \$20 million transaction.

But do any of us really care if the kind of people who pay \$20 million for a house have a slightly higher commission? (Laughter)

The ordinary commission is pretty well-earned.

WARREN BUFFETT: Yeah. We have a number of brokerage firms. So the highest has their average transaction - in one section of the country - would be close to \$600,000 a unit. But the - in terms of the sales price of the house. But the - in most of our real estate operations - the average price is more like \$250,000 or something in that area. And you can show a lot of houses to make one \$250,000 sale.

And of course, you split - the listing company and the selling company are usually two different companies. So it's - it does not strike me as excessive.

And incidentally, it doesn't strike the people in the industry that way either. It has not been particularly susceptible to online-type substitution or something of the sort. The real estate agent earns their commission in most cases.

But Charlie's had more experience with \$20 million houses. So he will comment on that area. (Laughter)

32. Some Kraft Heinz products “enjoy fairly healthy” growth

WARREN BUFFETT: OK, we'll have one more question before we break. Jonathan?

JONATHAN BRANDT: Given the changes in consumer tastes in the food business, and Kraft Heinz's already high margin structure, do you think the brands they own today, plus new product introductions, can together maintain or increase the current level of profits over the next ten years without the benefit of acquisitions? Is there anything in their portfolio besides ketchup that is enjoying growing demand?

WARREN BUFFETT: Well, in effect, you're asking me whether Kraft Heinz is a good buy. And we don't - (laughs) - we don't want to give information on marketable securities in that manner.

But - yeah, there are a number of items besides ketchup that enjoy growing demand. And some vary quite a bit by geography. There's enormous differences in the penetration of various products in the portfolio.

Consumer packaged goods are still a terrific business in terms of return on invested assets. And you know - but the population, worldwide, grows fairly small and at - a fairly minor rate. And - people are going to eat about the same amount. And there is some more willingness to experiment, you know, or go for organic products of the sort.

It's a very good business. And there are new products coming out constantly. It's not one where you're going to get terrific organic growth, but it never has been. And - you know, I like the business and we own 26 or so percent of it.

But there are a number of items within Kraft Heinz that enjoy pretty - fairly - healthy growth. And I think you'd find that at most food companies. And I think you'd find very good returns on invested - on tangible net assets - at those businesses.

Afternoon Session - 2018 Meeting

1. Thanks to meeting organizer Melissa Shapiro

WARREN BUFFETT: OK. Last year, for several years, we had a wonderful woman who carried this meeting off without a hitch, Carrie Sova. And she just had her third child here about a few weeks ago, and decided that — she decided right after the last meeting that that was going to be her full-time occupation.

And this year, again, we've had everything carried off without me having to do anything, without a hitch.

And I would just like to have Melissa Shapiro stand up. And we'll get a spotlight on her.
(Applause)

I can't believe it, how she does it. It's just been — it's remarkable. I mean, we — I just tell her the date and then that's all the help I am — (laughs) — and it goes on from there. So, Melissa, thank you.

OK, I think we next go to station ten, and we will continue until 3:30. Then we'll take a 15-minute break, and at 3:45 we'll convene the actual annual meeting.

2. Why Berkshire won't be buying Microsoft stock

WARREN BUFFETT: Station 10?

AUDIENCE MEMBER: Hi, I'm Theresa Lukasinski (PH). I'm from Omaha, Nebraska. And I have a question about Microsoft.

You have gotten into the tech world with buying Apple. You have Mr. [Bill] Gates there. I'm just wondering why you've never bought Microsoft.

WARREN BUFFETT: Well — (laughter) — in the earlier years, it's very clear it's — the answer's stupidity. But the — (Laughter)

Since Bill has — particularly since Bill has joined the board, but even earlier than that because of our friendship, it would be — it just would be a mistake for Berkshire to buy Microsoft.

Because if something happened a week later, a month later, in terms of them having better earnings than expected, or making an acquisition — anything — both Bill and I would — incorrectly, but — would be a target of suggestions and accusations, perhaps even, that somehow he had told me something or vice versa.

I stay away from — I try to stay away from a few things just totally because the inference would be drawn that we might have talked — that I might have talked to somebody about something.

So I've told the fellows, Ted [Weschler] and Todd [Combs] for example, that there are just a few things that are off the list because there would be a lot of people who wouldn't believe us if something good immediately happened after we bought it.

And of course, we — to buy a lot of stock, it can take six months to buy it or something of the sort. We just don't need it.

But both that and my stupidity have cost us a lot of money. (Laughs)

It's a very — it's a good question, and I think the answer makes sense.

Charlie?

CHARLIE MUNGER: Well, it's part of theology that a late conversion is better than never — (laughter) — and you've greatly improved yourself. (Laughter)

3. "Through it all ... America really, really moves ahead"

WARREN BUFFETT: Becky. (Laughs)

BECKY QUICK: All right, this question comes from Dave Shane (PH). He says, "Warren, you are a big believer in the U.S. political system, the financial system, and in every American.

You've said that regardless of who is president, the economy and the U.S. consumer will continue to prosper over the long run. All that said, do you believe that people in this country are more divided today than 50 years ago?

Or is it just social media, and media in general, that blows this divide out of proportion? And if you do believe the divide has grown, what words of wisdom do you have to possibly help remedy it?"

WARREN BUFFETT: Yeah, I would say this. Multiple times in my life, people have felt the country was more divided than ever.

And I've gone through periods where people I knew and admired thought that, because the other party was in power, that there never would be another election. That the Constitution would —

I've heard everything. Now, the interesting thing is this paper from 1942. Since then, there have been 14 American presidents, just since my young venture into the stock market at 11, I've lived under 14 of the 44 presidents the United States has had.

Now, they call Trump 45, but they count Grover Cleveland twice, so there's really only been 44 presidents of the United States. And 14 of the 44 have been during this period when that \$10,000 became 51 million.

Seven have been Republicans, seven have been Democrats. One has been assassinated, one has resigned under pressure.

It works, you know. It — if you'd told me at the start, you know, that you'd have a Cuban Missile Crisis, and you've have nuclear weapons, and you'd have a panic in 200[8] — a financial panic — and you'd have many recessions, and you'd have war in the streets in the late '60s from a divided country, you'd say, "Why the hell are you buying stocks?"

And through it all, you know, America — in fits and starts — but America really, really moves ahead.

And we are always — we survived the Civil War. I mean, it — I hate to think of having to do it that way. But this country, in only less than three of my lifetimes —

If you go back three of my lifetimes, you go back 263 years, I guess, and Thomas Jefferson is 12 years old. And that's just three — and there was nothing here.

You know, you've flown in from all over to Omaha today, and you flew over a country with more than 75 million owner-occupied homes, and 260 million vehicles, and great universities, and medical systems, and everything. And it's all a net gain in less than three of my lifetimes.

So — and we've had these events since I started buying my first stock. This country really, really works. And it always will have lots of disagreements, and after every election you'll have people feeling the world is coming to an end and, you know, "How could this happen?"

And I remember my future father-in-law in 1952, he wanted to have a talk with me before his daughter and I got married. So kind of reluctantly I sat down with him, and he said, "Warren," he said, "there's just one thing I want to tell you." He said, "You're going to fail."

He said — (laughter) — you know, "The Democrats are going to get in," you know, they're going to take over the country. And you're going to fail, but don't feel responsible for it because it's not your fault."

And he wanted to absolve me from this feeling that, while his daughter was starving to death, it was my fault. And — (laughter) — I kept buying stocks and doing a little bit better all the time. And, but —

And if the Republicans were in, it was OK, and it was because of them that I was doing well. And if they were out, forget it, it was all going to disappear and stuff.

I mean, I've seen a lot of American public opinion over the years. I've seen a lot of media commentary. I've seen the headlines. And when you get all through with it, this country has six times the per capita GDP growth — the GDP per capita — that it had when I was born.

One person's lifetime, six-for-one change. Everybody in this room, essentially, is living better in multiple ways, than John D. Rockefeller Sr. was, who was the richest person, you know, in the world at that — during my early years. And we're all living better than he could live.

So this is a remarkable, remarkable country, and we found something — (applause) — very special.

CHARLIE MUNGER: (Inaudible)

WARREN BUFFETT: I would love to be a baby being born in the United States today. Charlie. OK, Charlie, you give the other side of this.

CHARLIE MUNGER: Well — (laughter) — there's a tendency to think that our present politicians are much worse than any we had in the past. But we tend to forget how awful our politicians were in the past. I can — (Laughter)

I can remember a prominent senator [Roman Hruska] arguing with an absolute earnestness that mediocre people ought to have more representation on the United States Supreme Court.

WARREN BUFFETT: Yeah. He came from Nebraska, incidentally.

CHARLIE MUNGER: He did. He came from Nebraska. (Laughter) So we're not quite as bad as that yet.

WARREN BUFFETT: Yeah. He succeeded my dad in the House of Representatives.

4. "We'll have a somewhat larger operation at Gen Re"

WARREN BUFFETT: OK. Gary.

GARY RANSOM: Yes, on reinsurance. I know we've talked in the past about reinsurance not really being as attractive an industry in, say, the next ten years as the last ten. But I don't think we've talked specifically about General Re.

And I looked this morning at the 10-Q and I see General Re has grown nicely. I know there's been some changes in the management.

And I wondered if you could just give us a sense of what's going on at the company to bring about some of that growth and what looks like improvement.

WARREN BUFFETT: Yeah. Well, the reinsurance business — I don't think I'd say that it's tougher than it was ten years ago. But you go to 40 or 50 years ago, it was not brutally competitive, I'll put it that way.

And at Gen Re — Tad Montross, who did a fantastic job for us at Gen Re, retired. And we have under Ajit [Jain] — and then Kara [Raiguek] in addition — but under Ajit, the focus of the place has changed somewhat.

And it probably is more growth oriented than before. But I can assure you that anything associated with Ajit is — also has underwriting discipline attached to it.

But, I — there has, as you've correctly noticed, there's been some pick-up. And I think you actually will see the property-casualty reinsurance business grow a fair amount.

And the life business — reinsurance business — and this is really the only place we do much in life — but that has grown very substantially ever since we took it over, particularly internationally. And so that part, I like.

And we will have a somewhat — I think we'll have a somewhat larger operation at Gen Re.

But we have various methods, as you know, of being in reinsurance. We do these huge bulk deals. That's why our net revenues are down this year. We did that \$10 billion deal with AIG, which was the biggest deal in history, last year. And we don't have a repeat of it this year.

We will be in the reinsurance business five years from now, 10 years from now, 20 years from now, and 50 years from now, in my view. And we will have some unusual advantages that stem both from our capital position, our attitude toward the business, and the talent that we have.

We have an — we have a way better than average insurance business, generally. We have some real gems that nobody really knows much about.

And we have a very, very good reinsurance business that will be subject to more ups and downs than something like GEICO will be, which just moves ahead every year. But it will be an important part of Berkshire.

Charlie?

CHARLIE MUNGER: Yeah. I would argue the part that any idiot financier can easily get into has gotten way tougher. And why wouldn't it?

WARREN BUFFETT: Charlie is my substitute for my father-in-law that was — (Laughter)

5. "I can't reduce that to a formula for you"

WARREN BUFFETT: OK, Station 11.

AUDIENCE MEMBER: Hey, Warren. Charlie. Thank you again for having us and having me. I just can't thank you guys enough and appreciate you guys enough for the body of work that you guys have delivered to us and the exemplar example that you guys have set with your principles. Thank you. (Applause)

Charlie, you've mentioned that, if given the chance — or the same chance with a smaller capital base — you would still look for mispriced stock opportunities.

CHARLIE MUNGER: Of course.

AUDIENCE MEMBER: And that would be determined through, obviously, what we've called the intrinsic value of the organization — or the company in question — an aggregate of the discounted future cash flows.

Would you work the arithmetic using a fictional data set to illustrate the mathematical principles to determine an intrinsic value?

And I hope you include the comprehensive mental model of the key metrics considered, and quantitative assessments of the management, and any assumptions of its industry to determine the durability of its earning power.

And, Warren, same to that effect. Would you also demonstrate or illustrate an arithmetic problem set using, with a significant capital base, and provide the object lessons on how those have changed from a small to a large capital base?

CHARLIE MUNGER: Well, I can't give you a formulaic approach because I don't use one. (Laughter)

And I just mix all — (laughter) — I just mix all the factors and if the gap between value and price is not attractive, I go on to something else.

And sometimes it's just quantitative. For instance, when Costco was selling at about 12 or 13 times earnings, I thought that was a ridiculously low value, just because the competitive strength of the business was so great and it was so likely to keep doing better and better.

Well, I can't reduce that to a formula for you. I liked the cheap real estate. I liked the competitive position. I liked the way the personnel system worked. I liked everything about it.

And I thought, even though it's three times book, or whatever it was then, that it's worth more. But that's not a formula that anybody —

If you want a formula, you should go back to graduate school. (Laughter)

They'll give you lots of formulas that won't work. (Applause)

WARREN BUFFETT: This is the longest we've ever gone in a Berkshire meeting without Charlie saying that — getting to the point where he prefers Costco to Berkshire. (Laughter)

6. Why Apple and thoughts on Apple's buybacks

WARREN BUFFETT: OK, Andrew?

ANDREWROSS SORKIN: We got a handful of questions relating to Apple. This is a bit of a mash-up of a couple of them.

Warren, you have bought in and sold out of IBM. You have praised [Amazon CEO] Jeff Bezos but never bought Amazon. And you have doubled down on Apple. Can you tell us what it is about Apple?

And given your sometimes critical views on buybacks, do you think Apple would do better spending a hundred billion dollars on buybacks, or buying other productive businesses the way you have generally preferred? A hundred billion dollars is a lot of money.

WARREN BUFFETT: I used to think so. (Laughter) The —

Apple has a incredible consumer product which you understand a lot better than I do. Whether they should buy in their shares — they shouldn't buy in their shares at all, unless they think that they're selling for less than they're worth.

And if they are selling for less than they're worth, and they have the money, and they don't see an acquisition that's even more attractive, they should buy in their shares. And I think that that's very —

Because I think it's extremely hard to find acquisitions that would be accretive to Apple that would be in the 50 or 100 billion, or \$200 billion range. They do a lot of small acquisitions.

And, you know, I'm delighted to see them repurchasing shares. We own — let's say we own 250 million or so shares. They have, I think, 4 billion, 923 million or something like that. And mentally, you can say we own 5 percent of it.

But I figure with, you know, with the passage of a little time we may own 6 or 7 percent simply because they repurchase shares. And it —

I find that if you've got an extraordinary product, and ecosystem, and there's lots to be done, I love the idea of having our 5 percent, or whatever it may be, grow to 6 or 7 percent without us laying out a dime. I mean, it's worked for us in many other situations.

But you have to have some very, very, very special product, and — which has an enormous wide — enormously widespread ecosystem, and the product's extremely sticky, and all of that sort of thing.

And they're not going to find 50 or a hundred billion dollar acquisitions that they can make at remotely a sensible price that really become additive to that.

And they may find it, who knows? But there certainly, as I look around the horizon, I don't see anything that would make a lot of sense for them in terms of what they'd have to pay and what they would get.

Whereas I do see a business that they know everything about, and where they may or may not be able to buy it at an attractive price when they repurchase their shares. That remains to be seen.

Incidentally, that's one thing that I always enjoy. People say, "Well, you're talking your book," or something if you talk —

From our standpoint, we would love to see Apple go down in price. They're going to — well, just put it this way. If Andrew and Charlie and I were partners in a business that was worth \$3 million so each of us had a million dollar interest in it, if Andrew offered to sell out his one-third interest at 800,000 and we had the money around, we'd jump at the chance to buy him out. I mean, it's so simple.

But people get all lost — and if he'd wanted a million-two for it, we wouldn't pay it to him.
(Laughs)

It's very simple math, but it gets lost in all these discussions. And of course, like I say, Tim Cook could do simple math. And he could probably do very complicated math, too. So, we very much approve of them repurchasing shares.

Charlie?

CHARLIE MUNGER: I think, generally speaking in America, when companies go out hell-bent to buy other companies, they do — they're worth less after the transaction is made than they were before.

So I don't think you have a general way to wealth for American corporations to go out and buy other corporations. Averaged out, it's a way down, not up.

And I think that a great many places have nothing better to do than to buy in their own stock, and nothing as advantageous to do as they can — as buying in their own stock.

So, I think we know pretty damn well what's going to happen to Apple. They'd be very lucky to — if there was something available at a low price that they could buy. It's —

I don't think the world's that easy. I think that the reason these companies are buying their stock is that they're smart enough to know that it's better for them than anything else.

WARREN BUFFETT: And that does not mean we approve of every buyback, at all, though. I mean, we've seen —

CHARLIE MUNGER: No, no, no. I think some people just buy it to keep the stock up. And that, of course, is insane. And immoral. But apart from that, it's fine. (Laughter)

7. “I like very much our holdings of American Express”

WARREN BUFFETT: OK, Gregg?

GREGG WARREN: Warren, if we look at the performance of your equity investment portfolio the last three to five years, some of the strongest performances come from Visa and MasterCard, which put up returns that are three to four times greater than American Express.

Unfortunately, your holdings of the two names, which we assume were held by Todd [Combs] or Ted [Wechsler], have accounted for less than one percent of stock holdings on a combined basis the past five years, while American Express has tended to be a top-five holding, accounting for 10 percent of the portfolio, on average, and closer to 8 percent of late.

Given that all three firms benefit from powerful network effects along with valuable brands, were there any particular reasons Berkshire did not ramp up its stakes in Visa and MasterCard to more meaningful levels, especially during those years when American Express was struggling?

After all, you've shown a willingness to own several stocks from the same industry, holding shares in several competing banks, and buying stakes in all four domestic airlines in fairly equal amounts when you picked them up in late 2016.

WARREN BUFFETT: Yeah. When Ted and Todd, or either one of them — I won't get into which specifically — which one of them specifically — bought, or for that matter they could both have bought — Visa and MasterCard — they were significant portions of their portfolio.

And there was no embargo or anything on them owning those stocks because we had a big investment in American Express. And I could have bought them as well. And, looking back, I should have.

On the other hand, I think American Express has done a fabulous job, and now we own 17 and a large fraction percent of a company that not that long ago we may have owned 12 percent.

We've done it without spending a dime and without — you know, it's a company that has really done a fantastic job in a very competitive field where lots of people would love to take their customers away from them. But they have more customers than ever, and they're spending more money than ever. The customers are.

And the international growth has accelerated. The small business penetration is terrific. It's really quite a business. And, you know, we love the fact we own it.

Like I say, it didn't preclude me from, in any way, from buying MasterCard or Visa. And if I had been as smart as Ted or Todd, I would have. (Laughs)

Charlie?

CHARLIE MUNGER: Well, we would have been a little — a lot better with all of our stock picking if we could do it in retrospect.

But — (laughter) — at the time, we have a big position in American Express, and there is one tiny cloud on the horizon of the payments processors and that is the system of WeChat in China.

And so it isn't as though there isn't a little cloud somewhere off in the — and I don't have the faintest idea how important that cloud is, and I don't think Warren does either.

WARREN BUFFETT: No. No. Payments are a huge deal worldwide. And you've got all kinds of smart people working at various ways to change the payment arrangements. And —

CHARLIE MUNGER: To destroy what we have now.

WARREN BUFFETT: Sure, sure. And you've got some very smart people that, you know, I am — the — but there — building a company.

And American Express made a decision a few years ago not to bid as low as somebody else did to retain the Costco business. And I think — Charlie and I disagree on this — but I think it was a smart decision. He doesn't think it was a smart decision. But one of us will be right. And — (laughter) — and one of us will remind you that they were right. (Laughter)

The — but if you look at American Express, it is — it's a remarkable company. I mean, you know, they came after them with Sapphire last year. People want that business. And payments are changing.

And you can see in different countries different ways things are going on in that. And there are a lot of people that will play the game of gaming the system, and switch from one to another based on the rewards on this card or that, and all of that sort of thing.

But there also is a — I think there's a very substantial group for which American Express does something very special, and they keep capitalizing on that premier position with that group.

And they're doing it successfully around the country. And you'll see in the first quarter — you've seen in the first quarter — you know, where in Britain, in Mexico, in Japan, you're seeing gains of 15 percent or better in local currencies.

And the base is not tiny, but it's not huge, so there's a lot of room left to go in that. And the small business penetration is good. The loan portfolio has behaved sensationally compared to, really, just about anybody.

So, I like very much our holdings of American Express.

The first half, because of the accounting changes, they had to suspend their repurchase program for six months. But I — they've announced that they expect to renew it.

And someday we'll even, you know, we'll own a greater percentage of American Express and it will be a bigger company, in my opinion. And I think we'll do very well.

But as Charlie says, nobody knows how payments is — for sure — comes out. And nobody knows how autos for sure come out. And there — that is true of a great many businesses we're in, and we've faced it before.

We used to buy things that were certain failures, like textiles and second-rate department stores and trading stamps in California. Now we just face things that face real difficulty. So we're actually moving up the ladder. (Laughter)

8. Capital-intensive businesses are “good enough”

WARREN BUFFETT: OK, Station 1.

AUDIENCE MEMBER: Mr. Buffett, my name is Daphne Collier Starr (PH). I'm eight years old and live in New York City. I've been a shareholder for two years and this is my second annual shareholders meeting.

Berkshire Hathaway's best investments on which the company built its reputation have been in very capital-efficient businesses — (laughter) — such as Coke, See's Candy, American Express, and GEICO.

But recently, Berkshire has made really big investments in a few businesses that require huge capital investments to maintain and that offer only a regulated low rate of return such as — (laughter) — Burlington Northern Railroad.

My question to you, Mr. Buffett, is could you please explain why Berkshire's largest recent investments have been departed from your old capital-efficient philosophy?

And why specifically have you invested Burlington Northern instead of buying a capital-efficient company like American Express? (Applause)

WARREN BUFFETT: You're killing me, Daphne. (Laughter) Yeah.

CHARLIE MUNGER: I'm certainly glad she's not nine years old.

WARREN BUFEFTT: Yeah. (Laughter)

I'm just sitting here thinking which of the six panelists we're going to bump next year and put you in. (Laughter)

Well, I thought I was doing well when I bought that City Service at 11. (Laughs)

The answer is that we have — we'd love — we always prefer the businesses that earn terrific returns on capital, like a See's Candy when we bought it or a good many of the businesses.

And, we've — and, you know, American Express, you know, earns a terrific return on equity, and has for a very long time.

The fact that we buy a Burlington — BNSF, Burlington Northern — means that, essentially, we can't get more money deployed in capital-light businesses at prices that make sense to us. And so we have gone into more capital-intensive businesses that are good businesses.

But wouldn't it be wonderful if we could run the railroad without trains, and track, and tunnels, and bridges, and a few things?

We get a decent return on the capital-intensive businesses. We bought most of them at very decent prices, and they've been run very well since we bought them.

We still love a business that takes very little capital and earns high returns, and continues to grow, and requires very little incremental capital.

We can't deploy as much money as we have in doing that. And so as the second-best choice, still a good choice, the answer is yes. It's not as good as the best choice.

Charlie?

CHARLIE MUNGER: Yes, I like the aspiration of that young lady. She basically wants her royalty on the other fellow's sales. And of course that's a very good model, and if everybody could do that, why, nobody would do anything else.

The reason we're satisfied with our utility returns and our railroad returns is they're quite satisfactory. And we — and the — quite satisfactory. I wish we had two more just like them. Don't you, Warren?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: So —

WARREN BUFFETT: Definitely.

CHARLIE MUNGER: So the answer is they're good enough, and you're asking us to get perfection if you would want us to have all our money in Coke at, say five percent of what it's now selling for.

WARREN BUFFETT: Yeah. And a business like Apple really doesn't take much capital.

But — so, you've got to spend a lot of money to buy businesses like that. Very few are for sale.

And the answer is we have not foregone any opportunity to buy businesses that earn high returns — very high returns — on equity capital, when we could buy them at a sensible price, to buy these other businesses.

So they haven't shoved anything else off the table. But you are — you definitely have a job in our capital allocation department. (Laughter)

9. Buffett “surprised” rate of decline for newspapers hasn't moderated

WARREN BUFFETT: OK, Carol.

CAROL LOOMIS: This question is from Max Taylor (PH) of Chicago, and it concerns the newspapers that Berkshire owns.

In your 2012 letter to shareholders, Mr. Buffett, you had a section devoted to Berkshire's buying 28 newspapers during the year just past. Since then, you have not come back to the newspaper subject.

But this year, at the end of the annual report, you published a list of the newspapers Berkshire owns today, along with their circulation. I compared that list with the one you published five years ago at the end of 2012.

As you no doubt know better than anyone, the circulation of the 26 newspapers that Berkshire still owns, of the 28 originally bought, fell sharply. In many cases, by big amounts like 30 percent to almost 50 percent.

I know that five years ago, you acknowledged the risk in owning newspapers, but you still said, 'Charlie and I believe that papers delivering comprehensive and reliable information to tightly-bound communities, and having a sensible internet strategy, will remain viable for a long time.'

Skip to today, and imagine that you are writing about Berkshire's experience with newspapers. What would you be saying?"

WARREN BUFFETT: Yeah. I would say that — I forget the modifying word on internet strategy — but I could say (Inaudible).

The problem has been — about 1,300 daily newspapers in the United States — there were 1,700 not that long ago — is that no one except The Wall Street Journal, The New York Times, and now probably The Washington Post has come up with a digital product that, really in any really significant way, will replace the revenue that is being lost as print newspapers lose both circulation and advertising.

And if you look at the communities in which we operate, or the communities in which, you name it — other newspapers operate, the community could be prospering. We're in a prosperous economy presently. And all are losing daily circulation, they're losing Sunday circulation, they're losing street — all street sales, they're losing home-delivered.

And it is — I've been surprised that the rate of decline has not moderated in the last five years.

We bought all the papers at reasonable prices, so it is not of great economic consequence to Berkshire. But I would like to see daily newspapers, actually, you know, be economically viable, because of the importance to society.

But I would say that the trends which — I put those circulation figures in there because I think the shareholder's entitled to look, year-to-year, at what is happening. And it's not only —

It's happening to 1,300 newspapers throughout the United States. And it happens in small towns, where you would think that the alternative sources of information would not be that good. It happens every place.

And The Journal, The Times, and probably The Post, have a viable economic model in the digital world, and probably will continue to shrink — I'm almost certain will continue to shrink — in the print world.

But the digital world will be big enough that — and they'll be successful enough — so that they have, in my view, a sustainable business model.

But it is very difficult to see, with the lack of success, in terms of important dollars arising from digital, it's difficult to see how the print product survives over time. And that's — I'm afraid that's true of 1,300 papers in this country.

And we'll keep looking to see if there is a way to do it. But you'd have to look at our experience, and look at the experience of everyone else's.

McClatchy newspapers came out the other day, you know, and I think that newspaper — which is very good — fine cities that they operate in — and advertising revenue is down something like 17 or 18 percent, and circulation. But it isn't just them, it's everybody in the business. And I wish I had a better answer for you, but I don't.

I would say that the economic significance to Berkshire is almost negligible, but the significance to society, I think, actually is enormous.

And, you know, I hope that we find something. I hope others find something because we'll copy it. But so far, we have not succeeded in that.

Charlie?

CHARLIE MUNGER: Well, the decline was faster than we thought it was going to be. So it was not our finest bit of economic prediction. And I think it's even worse.

I think, to the extent we miscalculated, we may have done it because we both love newspapers and are — and have considered them so important in our country.

These little local newspaper monopolies tended to be owned by people who behaved well and tended to control the politicians. And we're going to miss these newspapers if they disappear. We're going to miss them terribly. And —

WARREN BUFFETT: I think you may continue —

CHARLIE MUNGER: — I hope to God it doesn't happen, but the figures are not good, Warren.

WARREN BUFFETT: No. No, they aren't. And it isn't just — you know, it isn't some town that has a particular problem with unemployment or anything of the sort. And it isn't due to general economic conditions.

It's due to the fact that a newspaper, if you wanted to know the baseball results from the present day, and the box scores, and everything else, they told you the following morning and it was still news to you.

And the financial material that I read from there, and in terms of looking at the stock prices and everything, they were news to you the following morning. And the —

What was developing in the Pacific in terms of the war was news to you when you read about it in the morning in The New York Times. And it's — news is what you don't know that you want to know. And the —

And those Help Wanted ads, you know, segregated as they may have been, still were the place to go to look to find a job. And you can go up and down the line and one element after another where the daily print newspaper was primary, they're no longer primary.

And the business has changed in a very material way, and we haven't been able to figure out any solutions to that, and we'll keep trying.

Like I say, it's not of economic consequence, but I think it is societal consequence. And we haven't been able to solve it.

10. TTI has "improved dramatically in the past year"

WARREN BUFFETT: OK, Jonathan?

JONATHAN BRANDT: TTI has been a nice growth story since Berkshire acquired it 11 years ago, more than doubling its pre-tax earnings to about \$400 million due to fine organic growth and at least two successful bolt-on acquisitions. Business momentum appeared to accelerate in the first quarter.

Can you please talk about the competitive landscape in the electronic components distribution industry and what TTI's advantages are? Is it just a great industry to be in or is TTI's business model and/or management team special?

WARREN BUFFETT: Well —

JONATHAN BRANDT: Do you expect it to continue to be one of Berkshire's faster growing non-insurance subsidiaries?

WARREN BUFFETT: TTI is run by a fellow named Paul Andrews who's done an absolutely sensational job with us. He's a wonderful man. He's a wonderful manager.

And in the last — he's quadrupled the business, basically, but in the last year and accelerating right to this point.

They distribute little electronic components. They actually — their average — they're a many-billion dollar business — and their average item is less than a nickel that they sell. So it's kind of like being in the jellybean business or something like that. Except these things go into all kinds of fancy machines that I don't understand.

And we have a worldwide operation based in the Dallas, Fort Worth area. And built by one man who left a division of General Dynamics 45 or 50 years ago. And step-by-step built up this business — like we just bought within the last two months, we bought an operation in South Korea that will be another substantial addition. We do business worldwide. And electronic components that have absolutely taken off in the last year.

And they use something called, you know, well, it's essentially a measure of backlog. And book-to-build is the ratio they call it. But it's just kind of a special term.

The — but, it's grown — I mean, it's just improved dramatically in the last year. And it continues month after month. So something is going on out there because nobody buys these things to store them in their basement or anything of the sort. I mean, these get used, these electronic components.

Some of them are on allocation. We have a great relationship with suppliers. We have a very good relationship with our customers because we carry more inventory than most of our competitors. So particularly when the business is tight we can deliver and do a very first-class job doing it.

So I give credit to Paul. He increased his physical facility, started on that a few years ago. And it's a godsend that he did it because with the business going through there now we wouldn't have been able to handle it.

But it's a competitive business. I mean, if you look at Arrow Electronics, you know, on the New York Stock Exchange — we've got competitors. I think Paul is doing a better job, by a considerable margin, than they are. And I'm delighted as a part of the Berkshire family.

There will be times when that business slows down because their customers, you know, will have their own cycles. And what it does will go down. But over time that business is going to grow.

Charlie?

CHARLIE MUNGER: Yeah, it's a wonderful business because it's so difficult to do that competitors don't want try it. When I lived in Omaha there was a man who lived in great prosperity and almost no work. And his business was gathering up and rendering dead horses. And he never had any competitors. (Laughter)

He used to come up to the Omaha Club and start drinking about 11 in the morning. It was not a difficult business. But nobody ever crowded him with new competition.

And very few people want to distribute zillions of electronic parts that are worth a nickel each. It's very complicated.

And of course that business is terribly good at it. And it keeps getting more and more of the same. So you're right. It's a huge growth business which is sort of the electronic equivalent of gathering up and rendering dead horses. (Laughter)

WARREN BUFFETT: Imagine keeping track of close to a million different items, you know, with very small values attached to them and getting them out to your customer fast because they

want them fast, all over the world. You know, and those things are not easy to manage. I mean, yeah.

CHARLIE MUNGER: And staying in stock on so many items. It's very complicated. And that business is very good at it.

WARREN BUFFETT: Yeah, we're luck —

CHARLIE MUNGER: And of course it'll grow. The horses went away but these parts aren't going to go away. (Laughter)

WARREN BUFFETT: Charlie made a profession of studying businesses where the owners could sit around and drink all day and have — (laughter) — he thought that was where we ought to be competing but — or buying.

CHARLIE MUNGER: My theory, Warren, is if it can't stand a little mismanagement, it's no business. (Laughter)

WARREN BUFFETT: Yeah and we're testing that sometimes. (Laughter)

11. Phillips 66 and staying below 10 percent ownership

WARREN BUFFETT: OK, Station 2.

AUDIENCE MEMBER: Hi, Ben Sherber (PH), Topeka, Kansas. Just want to say, Warren and Charlie, thank you again for hosting us all. This is a great event.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: My question is about the recent decision to sell shares back of Phillips 66. Not to put you on the hot seat. But right after that, share prices jumped up about \$22 a share.

You mentioned at the time that there's some regulatory requirements if you own over 10 percent of a company. Could you talk about the factors that go into how you decide whether to retain more than that or get under that threshold? And then what are your thoughts long-term on Phillips 66, like, their business mid-stream refining?

WARREN BUFFETT: Yeah, well, it was the City Service preferred of last year. (Laughter)

We sold the stock at around 93 or '4. And it's probably 115 now. But we own just under 10 percent of the company. And the more Ted [Weschler] and Todd [Combs] and I think about various problems connected with regulatory problems and trading problems and so on, overwhelmingly we will stick below 10 percent on marketable security holdings.

We've done it with the airlines. Now that does not mean we're going to reduce our holdings in American Express or anything of the sort.

But — and Greg Garland has done a great job at Phillips 66. We've had very good relations with the company. They're very — he's a very, very, very experienced and sensible manager.

But I did decide that I wanted to be below 10 percent in that holding. And we, like I say, we'll stay just slightly under 10 percent of Wells Fargo.

We've actually sold a few shares just to stay below 10 percent in the case, I think, of both American Airlines and United Continental.

Unless there's something unusual we're going to stay under ten. But we have nine and a significant fraction percent of Phillips. And I think they've been good at operations. I think they've been good at capital allocation.

We traded them a business — we traded them stock for a business some years ago, which has been a very nice business that we've retained in operation.

So we've got a lot of money still in Phillips. And I wish I'd made the deal at a higher price. But we made money on what we sold and we accomplished an objective.

Charlie?

CHARLIE MUNGER: Well, we like the subsidiary we traded the stock for. (Laughter)

WARREN BUFFETT: I missed that —

CHARLIE MUNGER: We traded the stock for a subsidiary.

WARREN BUFFETT: Yeah, well, yeah.

CHARLIE MUNGER: We like the subsidiary.

WARREN BUFFETT: Oh yeah. Well, it improved —

CHARLIE MUNGER: It isn't like the stock went away for nothing.

WARREN BUFFETT: Yeah. Yeah, actually we've done pretty well with Phillips.

12. Cryptocurrency craze will “come to a bad ending”

WARREN BUFFETT: Becky?

BECKY QUICK: This question comes from Vlad Koptev (PH) in Ukraine. He says, “Capitalization of cryptocurrency has approached that of Berkshire and Apple last year. And clearly the idea behind crypto will affect conventional banking groups where Berkshire is a shareholder. You always say you didn’t go into too much detail to obtain an understanding on cryptocurrencies. So what factors caused you to say that it’s a bubble?”

WARREN BUFFETT: Well, generally non-productive assets remain not only — if you’d bought gold at the time of Christ and you figured the compound rate on it, you know, it may be a couple tenths of 1 percent.

It essentially is not going to deliver anything other than supposed scarcity, you know, because they’ll only — you can only mine so many. But so what? I mean, what does it produce itself?

You know, the check is a wonderful idea. Just imagine how the world would be without being able to write checks or have wire transfer of funds. But it doesn’t make the check intrinsically itself worth a lot of money.

And if you said you can’t use something called “check” with a little piece of paper you’d do something else to transfer money.

I think that anytime you buy a nonproductive asset you are counting on somebody else later on to buy a nonproductive asset because they think they can sell it to somebody for more money.

And it’s been tried with tulips and it’s been tried. It’s been tried with various things over time. And it does come to a bad ending.

I mean, having — you have a hard time. You can think of raw land. I mean, the Louisiana Purchase was, say, \$15 million for 800,000 or so square miles of land. In fact, you’re sitting on land that came with the Louisiana Purchase.

And so what’d we pay? We paid 20 bucks a square mile. And, you know, 640 acres in a square mile. And you’re down to three cents or something. So that was a pretty good purchase of what was then a nonproductive property. But it’d depend — but it’s very hard. You can buy stamps. Bill Gross got, you know, collected a wonderful stamp collection. It sold for more money in the end.

But it’s dependent on somebody else wanting to buy, hoping they will sell it for more money and so on.

And in the end you make your money on productive assets. If you buy a farm, you try to estimate what the crops, what amount per acre of soybeans or corn or whatever may be raised, and how much you have to pay the farmer that farms it for you, and what your taxes will be, and various things. And you make a conclusion based on what the asset itself will produce over time. And that’s an investment.

When you buy something because you're hoping tomorrow morning you're going to wake up, you know, and the price will be higher, the only reason, you know, you need more people coming into it than are leaving.

And you can get that. And it will feed on itself for a while, and sometimes for a long while, and sometimes to extraordinary numbers. But in the end — but they come to bad endings. And cryptocurrencies will come to bad endings.

And along with the fact that there's nothing being produced in the way of value from the asset that you also have the problem that it draws in a lot of charlatans and that sort of thing who are trying to create various sorts of exchanges or whatever it may be.

You know, it's something where people who are of less than stellar character see an opportunity to clip people who are trying to get rich because their neighbor's getting rich buying this stuff that neither one of them understands. It will come to a bad ending.

Charlie?

CHARLIE MUNGER: Well, I like cryptocurrencies a lot less than you do. (Laughter)

And so to me it's just dementia. And I think the people who are professional traders that go into trading cryptocurrencies, it's just disgusting. It's like somebody else is trading turds and you decide, "I can't be left out." (Laughter and applause)

WARREN BUFFETT: To the extent that this — we are being webcast around the world, I hope some of our stuff doesn't translate very well, actually. (Laughter)

13. Shareholders will get a lot of the corporate tax cut benefit

WARREN BUFFETT: OK, Gary.

GARY RANSOM: Yes, I had a question on the corporate tax rate. And we have a debate in my investment world about where the benefits of that cut fall. And I'd say the consensus is going to the consumer as it gets competed away over time. But perhaps some of it sticks to shareholders.

And my question is, do you think, over the long run, some of the benefits sticks to shareholders? And maybe it's even beyond auto insurance? Maybe it's other businesses you have as well.

WARREN BUFFETT: Well, what people do generally with that is they take what they want to be the answer for them and then they hire — or they just attach themselves to some economist that gives them a more complicated way of saying it's all going to be wonderful because it's happened.

But the answer is that in the case of our regulated public utilities, the benefits are all supposed to go, and will go, to the utility customer, because we're entitled to a return on equity if we perform well. And we're not entitled to get excess returns because our tax rates changed. And similarly, if tax rates would go back up, we would expect to get compensated for that. So in that area — and that was 5 or \$6 billion for us.

But in that area, absolutely, it goes to the user, the consumer. And it should.

Then the question is, with the remainder, does it get competed away or not? And the answer is sometimes it does, sometimes it gets competed very quickly and substantially. Sometimes it may be slow. And other times it probably won't.

The one thing to know is that the change in the corporate tax law was good for shareholders, generally, and Berkshire shareholders. I mean — and that's what Congress passed. And the intent had to be that if you were going to cut taxes that shareholders would get a particularly large portion this time. And some of you will agree with that politically and some of you won't agree with it politically. But you'll all benefit equally. (Laughs)

And I think it's human nature if you're getting a break to say it's going to work wonderfully for everybody else. And we'll find out whether it will or not.

It's very, very, very difficult in economics to measure the impact of single variables. You cannot just do one thing in economics. People kind of learn that in physics and talk about butterflies in China and all that sort of thing. But the — every question you get in economics the next, any statement, you should say "and then what?"

And when you get into the "and then whats" you get start favoring people who give an answer to that in political life that happens to usually help you in some way or another, including your pocketbook. And we've see that with this. And it's helped the shareholders at Berkshire Hathaway.

I would say that some will be competed away. Some (inaudible) utilities and some will benefit Berkshire shareholders. Charlie?

CHARLIE MUNGER: I have nothing to add.

14. Utilizing multicultural backgrounds to improve international economies, and the benefits of multiculturality

WARREN BUFFETT: OK. Station 3.

AUDIENCE MEMBER: Hi, Mr. Buffett and Mr. Munger. My name's Kevin and I'm from Shenzhen, China, currently studying finance and philosophy at Boston College.

I have a rather broad question. In this more and more globalized world, what do you think our younger generation can do to best leverage our background and experience of both China and U.S. to create values and for the benefit two countries' economy and relationship? And what do you see valuable in a person with a multicultural background? Thank you.

WARREN BUFFETT: Well, I think in answer to the last question, I think it's terrific to have a multicultural background. And I never was any good at languages. But if I were in college today, in either country, I'd be learning the language of the other country, because I think it would be a great advantage over time.

The first part of the question, I'd like to have that stated again to me. I want to make sure I'm answering your specific aspect there on the — I think it's going to be good for your future. But can we have the microphone on up there again?

AUDIENCE MEMBER: So the first part of the question is, like, what do you think our younger generation can do to best leverage our background and experience of both China and U.S.?

WARREN BUFFETT: Well, I'd start with being multilingual, I mean, certainly, in terms of, you know, I mean, obviously you want to be able to express yourself in both. And the better you can understand, obviously, the culture of another society, obviously, that's a benefit.

But I think the market system, modified as it may be, both in China and in the United States, in a way, it really does — there will be an invisible hand, to some extent, that does work to improve the lot of future generations by the fact that both China and the United States, and the rest of the world, is improving. I mean, it is much better, in my view, particularly in a nuclear world. But it's much better to have people prospering throughout the world, partly through their own efforts but partly through their interactions with the rest of the world.

And we've made a lot of progress in that respect particularly since World War II. I mean, it was a terrific idea to have the Marshall Plan, you know, instead of behaving like we did after World War I and getting the result that we got. I think we behaved much more intelligently after World War II.

So I'm bullish on the future of United States. But I'm bullish on the future of China, and to a significant extent, you know, the rest of the world.

People are going to be living better 10, 20, 50 years from now. And I don't think that's something that can be stopped even. Charlie? Absent weapons of mass destruction.

CHARLIE MUNGER: Yeah, well, the multicultural stuff, it wouldn't do you much good to be fluent in both English and Chinese if you were, say, a proctologist in China or a proctologist in Nebraska. (Laughter)

So if you're going to use your multicultural background, you've got to work at some interface between the United States and China.

And you can raise money in the United States and invest it in China like Li Lu does or you can be some kind of an importer or a trade specialist. But you've got to get near that interface to benefit from being bilingual and so on.

WARREN BUFFETT: But you would bet that the interface will be substantially greater.

CHARLIE MUNGER: Huge.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Huge.

WARREN BUFFETT: And that's what you want to prepare for.

CHARLIE MUNGER: Yes. And I think that, generally speaking, that we get multicultural you can also be multidisciplinary. But generally I think people make more money if they're very narrowly specialized, like the proctologist. (Laughter)

And it's much harder to make a lot of money for most people if you try to imitate Warren and me.

WARREN BUFFETT: I'm glad I didn't meet him earlier. I mean — (Laughter)

15. Subsidiaries encouraged to offer low-cost 401(k) options

WARREN BUFFETT: OK, Andrew.

ANDREW ROSS SORKIN: OK, this question comes from someone who says, "I am a Berkshire employee and shareholder."

WARREN BUFFETT: Uh huh.

ANDREW ROSS SORKIN: "I read an investigative article from ProPublica and The Washington Post that many of Berkshire's various units only offer 401(k) plans with high fees that are actively managed rather than the low-cost indexes you have advocated as the best path for savings for retirement.

"The article's author said he contacted the company and nobody would comment.

“Will you do something to improve our 401(k) offerings to match your investment philosophy? And from an operational perspective, how did this happen, given your strong views on the topic?”

WARREN BUFFETT: Well, I’ve absolutely said what — many, many times through annual reports — and our managers know what I think about the attractiveness of having an index fund option. But they all have different plans, different histories. And they run their businesses.

And who knows, you know, which particular — if you go back to the older businesses, they have defined benefit pension plans, generally. Nobody puts them in anymore. And then the question is, you know, do you transition to something else.

In the end, we overwhelmingly thought our managers make those kind of decisions and others. And my guess is that a very high significant percentage of people who have — who work at a company that has a 401(k) plan will have an index fund option, but they may not, in some cases.

The only thing we — I think we have asked the companies to have a limit on the percentage, I think, that they might put in Berkshire’s stock through the 401(k). We don’t want people to lose jobs who are tied to Berkshire.

We certainly don’t want to be in the position of encouraging to put 100 percent or something of their savings in Berkshire itself. I don’t want to be in that position.

But I don’t think even there we’ve insisted on any company doing that. I think we’ve probably made that, when we’ve been asked about it once or twice, I think we’ve given that suggestion.

But the managers will run the companies. The employees, if they feel — and some of our companies have human relations departments — if they feel that they’d like different options or something like that, you know, they should make those views known to the managers. And in some cases the managers, I think, will pay attention to them and in others they probably won’t.

We’ve got a wide variety of managers that run our businesses. And we’re not going to start trying to run them from Omaha.

Charlie?

CHARLIE MUNGER: Well, you’re right. That has happened. That business of the high-fee choices, because we’ve delegated the whole subject to the managers of the subsidiaries. And so no attention at all is being given to the employee choices at headquarters.

And what you're pointing out is that a lot of the employees in the subsidiaries would do better if they indexed instead of choosing what they did choose. My guess is you're absolutely right about that. You know.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And if there are any people, managers, in the business today, I hope we'll do a little better at encouraging better choices.

WARREN BUFFETT: Yeah, although we don't want them to interfere too much in —

CHARLIE MUNGER: No.

WARREN BUFFETT: — directing what they, you know, we can take over human relations.

CHARLIE MUNGER: No, it's up to the managers. But we wouldn't object to a little different viewpoint.

WARREN BUFFETT: And we have made it very clear what we think. I mean, some of them don't listen to us. (Laughter)

16. Berkshire's culture will continue because "it works"

WARREN BUFFETT: OK, Gregg.

GREGG WARREN: Warren, you've noted time and again that there is a strong common culture shared across Berkshire subsidiaries built on a commitment to honesty and integrity, a focus on the long-term, and an emphasis on customer care. And it's also critical to find cultures that mesh well with Berkshire's when acquiring operating companies.

In most cases, the managers that are currently running these subsidiaries are the same individuals who are members of the families that originally sold their firms to Berkshire, leaving them with a vested interest in the businesses they are running and a strong connection to the culture they tend to share in common with Berkshire.

It seems to me that the greater challenge is in ensuring that the large publicly-traded firms that have been acquired and account for a meaningful and growing amount of Berkshire's overall value, stay the course. Could you comment on whether or not this is the case and what the greatest challenge is for you and Charlie when it comes to not only maintaining Berkshire's culture but in finding firms that would fit in well with what you've built?

WARREN BUFFETT: Yeah, I think the culture is very, very strong. And I think it gets reinforced — frankly, I think it gets reinforced by the shareholders we have. I mean, we have a different body

of shareholders and we look at those shareholders, I think, in a somewhat different way than a good many other companies do.

I mean, I think there are a fair number of public companies that wish they didn't have, you know, public shareholders. We're happy to have public shareholders. And we like having individual shareholders. And we don't favor institutions. And we're not going to, you know, give guidance and talk especially to them on investor calls and all that sort of thing. We want our — we want it to be directly with — we want shareholders who are partners, basically.

And it begins with that. It goes to the directors. We have directors who are not — well, I've been on 19 boards, and I've never seen another board like ours. And I think it's terrific that we've got the people who represent, in many cases, lots of shares themselves. They didn't get special deals. It's a group of owner-oriented, Berkshire-conscious, business-savvy owners.

And we don't have anybody on the board because they're a leading, you know, educator or whatever it may be. We want people who, basically, think about how to run a business well for themselves and for their partners. And we've got managers who fit into that culture, who have chosen that culture in coming with us.

And sometimes we have the second or the third or fourth generation, say at the Nebraska Furniture Mart, that share that. Is it perfect? No, it's far from perfect. I mean, you don't get everybody thinking the same way. We have people — we have people that are very independently minded running a lot of businesses. And some of them have different political beliefs, they have different — they see through different lenses than we do, to some degree.

But in terms of having a common, strong, positive culture, I don't think there's any big public company that has it any better than Berkshire. And I think that will continue because people opt into it to a great deal. Cultures get passed along. You do things that are consistent with the culture, so you do — what you talk about is what you do.

And you don't find people saying, you know, "We're a wonderful partnership," and then voting themselves, you know, huge options. And then a whole bunch of other people will say options beneath them because they can't look like they're taking it all for themselves, and arranging — I read about some deal where it could pay off with many, many, many billions of dollars, the other day. We won't name names.

But we've got as good a culture as you can get. And I would say, net, it grows stronger. We have a few people all of the time that really don't buy into it entirely. I mean, it is not 100 percent. But it's as close to it.

And I think it gets closer all the time as we go along. And we will keep — we will try to keep behaving in a way that reinforces it and doesn't dilute it. And I think that will not only work for Charlie and me but it will work for our successors very well. It won't be perfect.

Charlie?

CHARLIE MUNGER: Every time I come to one of these meetings and sit in the manager's luncheon, I feel more strongly at the end of the luncheon that the culture and values of Berkshire Hathaway will go on and on for a long time after the present management is gone.

In fact, I think it'll go on after all of the present managers are gone. I think we've started something here that will work well enough that it will last. And one of the reasons it will last is it's not that damned easy to duplicate.

So the one that is present is likely to just keep going and going. Think of how little direct copying of the Berkshire system there's been.

WARREN BUFFETT: But it won't produce the returns it's produced in the past even.

CHARLIE MUNGER: No, I think it's going to last a long time for a very simple reason. It's going to —

WARREN BUFFETT: It works.

CHARLIE MUNGER: — deserve to last a long time.

WARREN BUFFETT: It works.

CHARLIE MUNGER: And it's going to work.

17. Cash needed to support Berkshire insurance operations

WARREN BUFFETT: OK. (Applause) Station 4.

CHRISTIAN MAX: My name is Christian Max (PH). I'm a proud shareholder from Cologne, Germany. It is my pleasure to be here.

My question relates to the Berkshire insurance operations. When I look at the quarterly billing sheets of the last two decades, I noticed a pattern that I kindly ask you to discuss.

The sum of cash plus fixed income always hovers around 100 percent of the amount of insurance float. Therefore, my question is, is it fair to say that from the 128 billion of consolidated cash plus fixed income as of March, 116 billion are actually needed to support the insurance operations?

WARREN BUFFETT: No, I appreciate —

CHARLIE MUNGER: The answer is no. Yes.

WARREN BUFFETT: The answer is no. But he deserves an explanation of how this — maybe I haven't looked at it the way he's looked at it.

We would much rather have a number closer to 20 than to have 116. And we do not correlate or, in effect, measure the float and then decide how much to put or leave in cash, in fixed income.

The fact —our float keeps growing. And lately our — which is by design and has been terrific for us — and our cash and cash equivalents have has grown because the competition for acquisitions has become much stronger as — both as money has piled up with the buyers of businesses and because debt has been so cheap and a variety of factors.

But I don't think those are necessarily permanent. In fact, it would be reasonably true they aren't permanent. It's just a question of when they change.

We are not tying, as Charlie said, we're not tying the cash and cash equivalents at all to float. The float is (inaudible).

The float went up \$2 billion in the first quarter. And there is no way that that that float can shrink a lot in any short period. It just structurally has been set up in such a way that it will not — it cannot shrink. And actually, I think it'll grow a little bit for a while.

I mean, I've always been amazed by how much it has grown. We've got so much more float than any property-causality company in the world. And it's pretty amazing that it all came from that little building that Jack Ringwalt built and picked the location because it was near the tennis courts. (Laughs)

OK, Carol.

Oh, and Charlie.

CHARLIE MUNGER: There are encouraging recent developments. Some of the cash has gone out recently for securities we vastly prefer over the cash. And we have a lot of cash that could be — remaining — that could be deployed in securities we might like a lot better than Treasury notes. So stay tuned.

WARREN BUFFETT: Yeah, to make it very simple, in the first quarter we earned five and — from operations we earned a little over \$5 billion. Now, we only spent about our depreciation. Normally we would spend somewhat more than that. But that's 5-and-a-fraction billion. Two billion came, in net, from float. So that's \$7 billion that — basically in the first quarter — that would have been added to our cash if we hadn't done something with it. And instead our cash and equivalents went down, because we, net, invested more in equities by some margin than the seven that came in.

But we do have this position where, even absent a change in float, about 400 million comes into Berkshire every week, which is very comfortable. (Laughs)

And we will — we want to get it so that more than 400 million is going out into productive assets. And we succeeded in doing that in the first quarter. And, net, net we improved our position in the first quarter.

18. “Amazing” earnings in the new “asset-light economy”

WARREN BUFFETT: Carol?

CAROL LOOMIS: In your 1999 article in Fortune magazine, you stated your belief that after-tax corporate profits were unlikely to hold much above 6 percent for any sustained period, due not only to competition but also to public policy.

You stated in the article, “If corporate investors, in aggregate, are going to eat an ever-growing portion of the economic pie, some other group will have to settle for a smaller portion. That would justifiably raise political problems.”

Since 2008, after-tax corporate profits have been 8 to 10 percent of GDP. Do you believe that is a permanent shift in the U.S. economy? And of course, we have to think about the latest tax bill. Or will corporate profits revert back to the 4 percent to 6 percent of GDP range that was normal in the 20th century?

WARREN BUFFETT: Well, it’s been an interesting development during that period. It goes back a little bit before that period. But you now have the four largest companies, by market value, in the United States — a \$30 trillion market — you have four companies that essentially don’t need any net tangible assets.

And if you go back many years, I mean, if you looked to the largest companies — Carol used to put out the Fortune 500 list. And you know, it would be AT&T and General Motors, and it was companies that — Exxon Mobil — it was companies that just required lots of capital in order to produce earnings.

So American industry has gotten incredibly more profitable, in aggregate, in the last 20 or 30 years. You look at the return on the S&P 500, the earnings as a percent of net tangible assets, and the rest is just, you know, if you buy a company that has a million dollars’ worth of net worth and you pay a billion for it, it still only had the million dollars’ of net worth. I mean you just paid more for it. So the basic profitability of the company is huge, even though your investment may be at a significantly higher price.

So that what has happened is that, I think if you look at the earnings on tangible net worth of the S&P 500 and compare it to 20 years ago, it is amazing. And that is really due to the fact that this has become somewhat, you could call it an asset-light economy.

And you know, those four companies that earn 10 percent of the — they comprise close to 10 percent of the market value of the entire publicly-traded corporate America, they don't — and they don't take any money, basically. And that is a changing world. And they will earn even more money with the tax rate going down.

And I don't think people have quite processed all that information in terms of what has gone on in the market.

You don't — you know, [Andrew] Carnegie built a steel mill, and then he paid it off. Or he borrowed a little money, and then he built another steel mill, and all of that sort of thing. But it was enormously capital-intensive.

And one industry after another. AT&T was enormously capital-intensive. And now the money is in the asset-light — I mean, huge money is in the — not only asset-light business — but the negative asset.

You know, IBM even, you know, had — it has no tangible — it has a net — minus tangible net worth. There's nothing wrong with that. It's terrific. But it is not the world we lived in 30 years ago.

And in that sense, I didn't see that coming in 1999 when I wrote whatever I wrote there. It hasn't changed the profitability of the asset-heavy companies particularly. I mean, it isn't like oil.

If you take the five most capital-intensive industries in the '90s, I don't think you'll find that their earnings on tangible asset have increased a lot. But you will find that this group has moved in that really doesn't — they don't need any net tangible assets at all, or they need very minor amounts.

Charlie?

CHARLIE MUNGER: There's also a lot of financial engineering that's raised leverage, even in the capital-intense businesses. And you know, while Warren may have predicted a little wrong when he wrote that very scholarly article, he didn't invest wrong. And so it just shows that it's hard to make these economic predictions.

WARREN BUFFETT: OK, Jon —

CHARLIE MUNGER: We weren't very right on that one, Warren.

WARREN BUFFETT: Yeah, actually, the performance of the stock market since then has been pretty accurate. (Laughs)

CHARLIE MUNGER: Yes. That's true.

WARREN BUFFETT: Yeah. Being right for the wrong reason or something. (Laughs) Or wrong for the right reasons.

19. “We still feel OK” about AIG’s \$10.2 retroactive premium

WARREN BUFFETT: Anyway, Jonathan? (Laughs)

JONATHAN BRANDT: Berkshire received a 10.2 billion retroactive premium from AIG early last year. If the upwardly revised estimate of 18.2 billion of ultimate claims proves to be correct, will the cost of float, adjusted for favorable tax attributes, likely be lower or higher than what Berkshire would have paid to borrow 10 billion for a similar duration?

WARREN BUFFETT: Well, we certainly go in with the idea that it will be — the cost will be lower. And it’s an interesting situation.

We — essentially, AIG, which is one of the largest property-casualty, particularly commercial property-casualty companies in the world, said, “We want to give you all of the losses that we incurred in a very big percentage of our domestic business before December 31st of 2015, and we will pay the first 25 billion. And then after we pay 25 billion and AIG pays \$25 billion, then you pay 80 percent of the next 25 billion.” And they gave us \$10 billion for doing that. And that’s —

If we are correct about our estimates of how much money will be paid and when it will be paid, we should come out being better off than if we had borrowed a similar amount.

We have a history of doing 10 or so — maybe 12 — big deals like that. We hold the record. We did it for Lloyd’s of London 10 or more years ago, and we did it now with AIG.

And sometimes we’ve been on the low side in our estimate, and sometimes we’ve been on the high side so far.

AIG just said that they — I think they paid 15-and-a-fraction billion on these pre-12/31/2015 losses. They paid 15-and-a-fraction billion. But the payments tend to trickle down over years as you get further away from when the losses occurred.

So I would say that we still feel OK about it, and we’ll be wrong one way or the other. Everybody is when you estimate losses that may not get settled for 20 or 30 years. But so far, on the group as a whole of these deals we’ve done, we’ve been OK. And I think on the AIG thing, we think we’ll be OK. And I think AIG thinks we’ll be OK. I mean, they entered into it for good reasons of their own. So it looks OK.

Sorry to get into this technical stuff, but Jonathan always asks me questions like that, so I have to be ready to — I want to answer them.

20. “We really want products where people feel like kissing you”

WARREN BUFFETT: OK. Station 5.

AUDIENCE MEMBER: Good afternoon. My name’s Adam Bergman with Sterling Capital in Virginia Beach, Virginia. I’m here with my daughter Michelle from Cape Henry Collegiate in Virginia Beach.

AUDIENCE MEMNBER: Hi Warren, hi Charlie.

AUDIENCE MEMBER: Our question for you is how you go about attempting to forecast the degree of future success of one specific product in a good business versus another, such that you invest in American Express and Coca-Cola rather than Diners Club or RC Cola, for example. Thanks.

WARREN BUFFETT: Well, with American Express — (laughs) — it was an interesting situation, because Diners Club got there first. I think American Express, in a certain sense — I mean, they did it for a lot of reasons — but they went into the credit card business because they were worried about what was going to happen to traveler’s checks. And — although traveler’s checks are — still exist in a significant way.

But the interesting thing when American Express went into competition with Diners Club, and with Carte Blanche, as I remember that — which also existed at the time — was that instead of charging less than Diners Club and going in figuring they were going against the established guy and they’d come in at a lower price, they went in it at a higher price, as I remember.

And the American Express centurion was on that card. I’ve got one that I got in 1964, but they were in it before that. It had more value in time. I mean, it got better representation. And frankly, if you were a salesperson out with somebody, and you could pull out that American Express card with that centurion, you looked you were JP Morgan. And if you pulled out the Diners Club, it had a whole bunch of flashy symbols, you looked like a guy that was kiting his checks from one month to the next, and — (Laughter)

A fellow named Ralph Schneider — Ralph Schneider and Al Bloomingdale developed the Diners Club. And they were very smart about getting there first, but they weren’t smart about how they merchandised it subsequently.

RC Cola, you know, it did — there are all kinds of colas that came after Coke. I mean, you know, you go back to 1886 and come up with something at Jacobs’ Pharmacy that’s incredibly successful, you know, fairly soon you’re going to get lots of imitators. But Coke really is the real thing. And you know, you offer me RC Cola and say, “I’ll give it to you at half the price of Coca-Cola,” in terms of drinking it,

I mean, just, this is a product that's 6 1/2 ounces, sold for a nickel in 1900, you know. And now if you buy it on the weekend and buy it in large quantities and everything, you're not paying that much more. This newspaper was three cents in 1942, you know. I mean, the amount of enjoyment per real — in terms of the real — of what you pay for this, has gone dramatically down in inflation-adjusted money. So it is a bargain product.

You know, you have to look at — See's Candy, you know, if you live in California and you were a teenage boy, and you went to your girlfriend's house and you gave the box of candy to her or to her mother or father and she kissed you, you know, you lose price sensitivity at that point. (Laughter)

So we really want products where people feel like kissing you, you know — (laughs) — rather than slapping you.

It's an interesting thing. I mean, you know, in effect we're betting on the ecosystem of Apple products, but — led by the iPhone. And I see characteristics in that that make me think that it's extraordinary. But I may be wrong.

And you know, so far we've been — I would say we've been right on American Express and Coca-Cola.

American Express had this huge salad oil scandal in 1960 happen — in '63, November, right around the time [President John] Kennedy was shot. And there was really worry about whether the company would survive.

But nobody quit using the card. Nobody quit using the traveler's checks. And they charged a premium price for their traveler's checks. So there are things you can see around consumer products that sometimes can give you a pretty good insight into the future. And then sometimes we make mistakes.

Charlie?

CHARLIE MUNGER: I've got nothing to add, except that if we'd been offered a chance to go into Coca-Cola right after it was invented, we probably would have said no.

WARREN BUFFETT: We'd have turned it down. Yeah.

CHARLIE MUNGER: It would've looked kind of silly to us.

WARREN BUFFETT: Well, unless we drank it, now, Charlie, listen. (Laughs)

No, he's right. I mean, we don't foresee things that we haven't got a lot of evidence in on. And —

CHARLIE MUNGER: No.

WARREN BUFFETT: We want to see a lot of — if we're talking about a consumer product — we want to see how a consumer product behaves under a lot of different circumstances, and then we want to use something — actually, there was a book by Phil Fisher written around 1960 called "Common Stocks and Uncommon Profits." It's one of the great books on investing.

And it talks about the "scuttlebutt method" of investing, which was quite a ways from what Ben Graham taught me in terms of figures. But it's a very, very good book. And you can learn a lot, you know, just by going out and using some shoe leather.

Now they call them channel checks now or something like that. But it's — you can get a feel for some products, and then there are others you can't. And then sometimes you're wrong. But it is a good technique. It's an important investing technique, I would say that. And Ted [Weschler] and Todd [Combs] do a lot of that. And they have people — some people that help them out on doing it, too.

Charlie's done it with Costco. I mean, he's — (Laughs)

I mean, all the time he is finding new virtues in Costco, you know, and then it — and he's right, incidentally. I mean, Costco has an enormous appeal to its constituency. They delight — they surprise and delight their customers. And there is nothing like that in business. You have delighted customers, you're a long way home.

21. Hostile bids aren't "evil" but Berkshire doesn't do them

WARREN BUFFETT: OK, Becky.

BECKY QUICK: This comes from John Hegarty (PH) at Brightstar Capital Partners, who writes, "Warren, you're stepping down from the Kraft Heinz board at a time when the company's looking to do a large acquisition: Unilever, for example. Do you fundamentally disagree with the combative nature of hostile bids, activist investing, and competitive proxy contests?"

WARREN BUFFETT: Well, we will not make hostile tenders ourselves. I do not believe that there's anything fundamentally wrong with the idea. I mean, if you take the Fortune 500 companies, I'm sure that all 500 are not managed by the best, or in some cases even the friendliest to investor managements in the world.

So I don't think it's evil or anything to conduct a hostile offer for a company. It's just we won't do it, and we don't want to get into that. We like being liked by the managements that we join, because we're counting on them to run the company, and we're not bringing in a whole bunch of people that know how to change businesses.

We seldom take a position opposite the management — very seldom — on anything involving a proxy, but — contest of sorts. But we don't rule it out. We don't think every management is entitled to be — you know, they don't have a lifetime hold on their business. But it's not our style at all to — well, we won't do it in terms of initiating it ourselves, and we'd be very, very, very unlikely to support a contest.

But we have voted against a couple of propositions over 50 years that managements have had — made — in relation to stocks options. We withheld a vote at Coca-Cola a few years ago to express our opinion.

But we don't think it's evil for the shareholders, in some cases, to have different opinions about who should run the company, or whether compensation's appropriate, or matters of that sort. The stockholders still own the company.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that. I don't envy these people that are in these unfriendly uproars all the time. Imagine doing that after you're already rich. It's insane.
(Laughter)

WARREN BUFFETT: Yeah. Yeah, we are definitely not looking for it. We don't —

There are certainly companies that deserve challenge. And they propose things that deserve challenge occasionally. But again, it's not our main activity.

And incidentally, this has — the question was asked in reference to Kraft Heinz.

The people at 3G are great, great managers. They've been wonderful partners. I had made a determination, before we got involved there, I was going to be on no more public boards. I'd been on 19 of them, and it takes a lot of time. And they asked me if I'd go on for a while, and I did.

But it really is, like, seven-and-a-half days or something. And if you're on a bank board, it may be quite a bit more than that. I mean, there just —

Being on a public board usually means quarterly meetings plus maybe an extra one. And, you know, at 87, I think I've now learned what happens, and it's fine, but I don't want to spend seven-and-a-half days a year when I — maybe I can call up people that I trust and admire who are on the board in five minutes, you know, and find out what's going on or whatever it may be, any questions that come up.

And so we are their partners, and delighted to be their partners. And now we have two people on the board of Kraft Heinz, and they can do the traveling and I can stay home.

Charlie, how many public — you're on Costco, of course, over the — your lifetime, how many public boards?

CHARLIE MUNGER: Oh, I — Costco — except for something —

WARREN BUFFETT: Kansas City Power.

CHARLIE MUNGER: — like The Daily Journal where I own part of it, Costco's the only public board —

WARREN BUFFETT: You were on Kansas City Power.

CHARLIE MUNGER: — if it wasn't Berkshire or something I owned personally.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: I was on Kansas City Power and Light. Boy, that goes way back. But basically it hasn't happened. I don't envy people who float around to a lot of different board meetings.

WARREN BUFFETT: No, generally speaking you have very little influence and spend a lot of time. And the trouble is, if you're going to a board meeting, particularly if you get to the international, and sometimes they feel they have to have one that's international, you know, they feel they have to take up a fair amount of your time or it wouldn't have been worth coming, you know, thousands of miles for.

So you get a lot of the show and tell stuff and — that — I find my mind drifting. OK. (Laughter)

22. Berkshire still not on radar screen of international business sellers

WARREN BUFFETT: Gary.

GARY RANSOM: Yes, you've said that you are looking for non-insurance large acquisitions to put that cash to work. And when you've said that, I've usually thought of the United States, because you're a big fan of the U.S. business.

And I just was wondering whether you're seeing more opportunities as the rest of the world opens up, grows, whether there's opportunities for some of those mega-transactions in other parts of the world, say Asia or Europe.

WARREN BUFFETT: Yeah, Gary, I would say that I've been disappointed in that, because we do see some outside the United States, and thank heavens we saw the one we saw in Israel some years ago [ISCAR] when Eitan [Wertheimer] wrote me a letter. But — and you know, we bought a business which is a very important part of Berkshire now.

But we are still not — they're certainly aware of Berkshire Hathaway outside the United States. But they don't sort of pick up the phone automatically.

In the United States, I think any large — particularly private — company that thinks — is thinking about doing something, they at least think about Berkshire. But that — in Europe or Asia, that — we are not embedded in the minds the same way.

They know about us, they know we've got a lot of money and they know we like to buy things. But we really, we're on the radar screen big-time in the United States, and we're not as — we don't — the immediate desire to be sure that they've thought about the Berkshire option does not occur the same way outside the United States. And we've tried to encourage it a few ways. But I would say that the results have not been great at all.

But I hope tomorrow, you know, I get a call from Germany or Britain or Italy or you name it, and Australia, wherever it may be. And I hope I get a call and we get an opportunity to do it.

There's a good many countries we'd be quite happy to put substantial money into it. And like I say, our experience in Israel has been just terrific.

Charlie?

CHARLIE MUNGER: Yeah, but the corporate acquisition game now is so driven by the leveraged buyout and the so-called, whatever they call them, strategic, yes, strategic. I usually translate that into barnyard language. (Buffett laughs)

And we're so — there's so much craziness in price from our viewpoint. Of course, it's very hard for us to do it.

The people in the leveraged buyout game, who love massive leverage and don't mind high prices, even they are getting nosebleeds. It's hard. And it's not an environment that means that — that allows Berkshire just to go out and buy a whole lot of companies.

WARREN BUFFETT: Have you ever made a strategic deal that you —

CHARLIE MUNGER: We have to wait.

WARREN BUFFETT: We've made a strategic deal that you can remember?

CHARLIE MUNGER: Hmm?

WARREN BUFFETT: Have we ever made a deal that we would have regarded as strategic?

CHARLIE MUNGER: We've never had a strategic plan unless you've hidden it from me.
(Laughter)

WARREN BUFFETT: OK. That answers that.

23. Investing “doesn’t require advanced learning”

WARREN BUFFETT: Station 6.

AUDIENCE MEMBER: Hi, I’m Brady Ritchie (PH) from St. Louis, Missouri. Shareholder since 1996.

WARREN BUFFETT: Terrific.

AUDIENCE MEMBER: Warren, you and Charlie have been critical of business schools in the past and what they teach. With respect to value investing, in “Superinvestors of Graham-and-Doddsville,” you featured the returns of many great investors with different backgrounds’ work in education, with the lesson being, “Following the philosophy is the key.”

To be successful today, does it still just fall back to chapter eight of “The Intelligent Investor?” And what do you think of programs and designations such as CFA, CFP, et cetera, which purport high standards yet root it heavily into academia? And I’d like to challenge you to a round of bridge tomorrow. (Laughter)

WARREN BUFFETT: And what was the last part?

CHARLIE MUNGER: Well, he was talk — what do we think about —

WARREN BUFFETT: Yeah, business schools and all that.

CHARLIE MUNGER: — business schools and all that.

WARREN BUFFETT: I didn’t catch the last —

CHARLIE MUNGER: They’re better —

WARREN BUFFETT: Oh, he’s challenged me to a round of bridge. OK. The — (Laughter)

I went to three business schools, and at each I found a teacher or two. I went to one specifically to get a given teacher. But at each one of them I found a teacher or two that I really got a lot out of. The — so we’re not anti-business school here at all.

We do think that the priesthood, say, 30 years ago, for example, in terms of — or 40 years ago — in terms of efficient market theory and everything. They strayed pretty far, in our view, from the reality of investing. And I would rather have a person — if I could hire somebody among the top five graduates of number one, two or three of the business schools, and my choice was somebody that had — was bright — but had chapter eight of “The Intelligent Investor”

absolutely — it just was natural to them — they had it in their bones, basically — I'd take the person from chapter eight.

This is not — what we do is not a complicated business. It's got to be a disciplined business, but it is — it does not require a super IQ or anything of the sort. And there are a few fundamentals that are incredibly important, and you do have to understand accounting. And it helps to get out and talk to consumers and start thinking like a consumer in many ways in certain — and all of that.

But it just doesn't require advanced learning. And — I — I certainly — you know, I didn't want to go to college, so I don't know whether I would have done better or worse if I'd just quit after high school, you know, and read the books I read and all of that.

I think that if you run into a few great teachers, and they really change the way you see the world to some degree, you know, you're lucky. And you can find them in — you can find them in academia and you can find them in ordinary life.

And I've been extraordinarily lucky in having great teachers, including Charlie. I mean, Charlie's been a wonderful teacher. And, you know —

Anyplace you can find somebody that gives you insights into things you didn't understand before, maybe makes you a better person than you would have been before, you know, you get — that's very lucky, and you want to make the most of it. If you can find it in academia, make the most of it. And if you can find it in the rest of your life, make the most of it.

Charlie?

CHARLIE MUNGER: Well, when you found Ben Graham he was unconventional, and he was very smart. And of course, that was very attractive to you. And then when you found out it worked and you could make a lot of money while you're sitting on your ass — (laughter) — of course you were an instant convert. And so —

WARREN BUFFETT: It still appeals to me, actually. I mean — (Laughter)

CHARLIE MUNGER: But the world changed. Before he died, Bill Graham — I mean, Ben Graham — recognized that the exact way he sought undervalued companies wouldn't necessarily work for all times under all conditions. And that's certainly the way it worked for us.

We gradually morphed into trying to buy the better companies when they were underpriced, instead of the lousy companies when they were underpriced. And of course, that worked pretty well for us.

And Ben Graham, he outlived the game that he played personally most of the time. He lived to see most of it fade away. I mean, just to find some company that's selling for one third of its

working capital, and figure out it could easily be liquidated and distribute \$3 for every dollar of market price. Lots of luck if you can find those in the present market. And if you can find them, they're so small that Berkshire wouldn't find them of any use anyway.

So we've had to learn a different game. And that's a lesson for all the young people in the room. If you're going to live a long time, you have to keep learning.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: What you formerly knew is never enough. So if you don't learn to constantly revise your earlier conclusions and get better (inaudible), you are — I always use the same metaphor. You're like a one-legged man in an ass-kicking contest. (Laughter)

WARREN BUFFETT: If anybody has suggestions for another metaphor, send them to me. (Laughter)

Graham, incidentally, one point, important point. Graham was not scalable. I mean, you could not do with really big money. And when I worked for Graham-Newman Corp, here he was, the dean of all analysts. And you know, he was an intellect above all others around that time.

But our — the investment fund was \$6 million, and the partnership that worked in tandem with the investment company also had about \$6 million in it. So we had 12 million bucks we were working with. Now, you can make adjustments for inflation and everything. But it was just a tiny amount. It wasn't really scalable.

And the truth is that Graham didn't care, because he really wasn't interested in making a lot of money for himself. So he had no reason to want to find something that could go on and on, become larger and larger.

And so the utility of chapter eight, in terms of looking at stocks as a business, is of enormous value. The utility of chapter 20 about a margin of safety is of enormous value. But that's not complicated stuff.

CHARLIE MUNGER: I finally figured out why the teachers of corporate finance often teach a lot of stuff that's wrong. When I had some eye troubles very early in life, I consulted a very famous eye doctor. And I realized that his place of business was doing a totally obsolete cataract operation. They were still cutting with a knife after better procedures had been invented.

I said, "Why are you in a great medical school performing absolute obsolete operations?" And he said, "Charlie, it's such a wonderful operation to teach." (Laughter)

Well, that's what happens in corporate finance. They get these formulas, and it's a fine teaching experience. (Laughter)

You give them a formula, you present the problem, they use the formula. You get a real feeling of worthwhile activity. (Laughter)

There's only one there. It's all balderdash.

WARREN BUFFETT: Yeah, whenever you hear a theory described as elegant, watch out, you know. (Laughter)

CHARLIE MUNGER: Right.

24. Buffett “bullish on human race” as women enter the workforce”

WARREN BUFFETT: OK, Andrew.

ANDREW ROSS SORKIN: This question — we got a couple like this one — comes from Lauren Taylor Wolfe. She's a managing partner at Impactive Capital.

“Warren, you've recently said that one of the things that makes you optimistic about America is women entering the workforce and the quote ‘doubling of the talent that's effectively employed in that workforce.’ When it comes to positions of leadership, however, women make up less than 21 percent of boards of S&P 500 companies, and an even smaller 5 percent of the CEOs.

“What can Berkshire do, and what is Berkshire specifically doing, as a major investor in many of these large companies, to advance gender equality, both at the board level and among senior leadership?”

WARREN BUFFETT: Yeah. Well, again — (applause) — you know, as I've pointed out in the past, one of my sisters is here. And I have two sisters that are absolutely as smart as I am. And they have better personalities, as anybody that knows both of us — or all of us — can attest. And they didn't remotely have the same opportunities I had.

And you have this 1942, or — New York Times — and you know, women could be nurses or teachers or retail clerks or stenographers. And that actually worked enormously to my advantage when I was a kid in Omaha in the '30s, because I had way better teachers, because they were — that was a job open to women, I didn't have a single male teacher in grammar school, and Charlie didn't when he went to Dundee, I don't think, either.

And we had this huge talent pool that was being funneled into very few opportunities, and therefore we got better than we deserved in terms of a market system producing it. The —

Again, our managers run their companies. But I've probably named — before we made this management change — I probably named only six or seven CEOs in the last five or six years. We

don't change that much. But I would say that half of them that I've named have been women, which is about what you would — what should turn out to be the case in terms of ability.

Now, there is a certain pipeline problem, but that gets cured with time, and you can't use that forever as an excuse.

And you know, I feel very good about the decisions we made for CEOs. I prefer all our CEOs to live forever. And one woman almost did that, that we hired. Mrs. B. [Nebraska Furniture Mart founder Rose Blumkin] lived to be 104. She retired at 103. And that's a lesson to our other managers, that if you retire prematurely, you know — (laughter) — no telling what'll happen.

But it is absolutely true. It does make me bullish. It makes me bullish on the human race. But it's certainly on our country. Because if you look at what happened, you know, before the 19th Amendment, and then after the 19th Amendment for a long time, and continuing to this day, but it's — that — there's been significant improvement.

And I do feel more optimistic about the future, because I think there will be more selection by merit, rather than, you know, by gender or by race or by inheritance.

I think that if you had a system where all businesses got passed on to the eldest son or something, I think it — I think that society would make a lot less progress than one that's merit-based.

Charlie?

CHARLIE MUNGER: Well, we did live in a different age. There's an old saying that the past is a very strange country. People behave quite differently there. And it was just totally different. And it was ridiculous that — I cannot remember — I had one or two male teachers in my high school. But almost none. And the world has really changed.

And within Berkshire, I've never seen any overt discrimination anywhere on the grounds of gender.

WARREN BUFFETT: There probably has been some, though. I mean —

CHARLIE MUNGER: No, no, I'm sure that we have our —

WARREN BUFFETT: Oh, there has —

CHARLIE MUNGER: —share of all the peculiarities of human nature.

WARREN BUFFETT: Sure.

CHARLIE MUNGER: But it's generally, it's — everything has always improved, wouldn't you agree with that?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And I think it'll keep improving.

25. Berkshire buybacks not limited by state insurance rules

WARREN BUFFETT: OK. Gregg?

GREGG WARREN: Warren, in this year's annual report it was noted, much as it is every year, that payments of dividends by the company's insurance subsidiaries are restricted by insurance statutes and other regulations, with Berkshire's insurance operations currently allowed to declare up to 16 billion as ordinary dividends during 2018.

My question here is, should we view this annual regulatory threshold for dividends as a benchmark for allowable share repurchases as well? And in the event that Berkshire wanted to buy back more stock than that, or pay out even more as dividends, would there be an issue with you using capital from operations that aren't held by the insurance operations to return additional capital?

With the side question here being, would the annual cash distribution from BNSF, which is held on National Indemnity's books, be excluded?

WARREN BUFFETT: Yeah. The — we will obviously follow the rules of the states in which we're domiciled, and all the rules, of course. But basically it's the state of domestication in the insurance companies, and they do restrict the amount of dividends in any given year. Although you could, if you wanted to, request some additional amount. But we don't ever consider that.

But repurchases — if repurchases were really attractive, we would do it in a very big way. And, you know, I wouldn't rule — there's all kinds of ways that we could arrange things to do either a very large acquisition, which is what I would prefer, or a very large repurchase, would I don't think is probably in the cards just because the way our stock trades, not because we wouldn't like it at a large discount.

So Charlie and I, we've got the appetite. And we would have — we've got a lot of cash — but we could have a lot more cash. We can make any deal of — even one of a very large size. We can make anything that came along — we could work out how to get it done.

We would — we would have — we're not going to be doing this, but we would have partners who would come in and give us a preferential part of a partnership. That's not going to happen, in all probability. But there's a lot of things that we could do. So don't rule out anything based on statutory limitations of distributions from insurance companies —

CHARLIE MUNGER: And that — we could get special permissions to —

WARREN BUFFETT: Oh, we can get —

CHARLIE MUNGER: — declare bigger dividends. We are not — you should not assume that we're constrained by the laws of nature to the amount that we can take out under the statutes now.

26. Munger: "I don't think the world is going to be changed that much by machine intelligence"

WARREN BUFFETT: OK, station 7.

AUDIENCE MEMBER: Hi, Warren and Charlie. Thank you for everything. I'm David (inaudible), an investment manager in Shanghai. I've been here for eight years.

If investment is a sport in the Olympics, you are our champion team. So my question is, facing the fast-growing machine challenges, how do you see the new competition impact the capital allocation productivity in the future?

For Charlie, what is the first principle of capital allocation from a general economic interest point of view? Thank you.

CHARLIE MUNGER: Well, two questions. Machine intelligence. I'm afraid the only intelligence I have is — is being provided by something that's not a machine. And I don't think I'm going to learn machine intelligence. Yeah. If you ask me how to beat the game of Go with my own intelligence, I couldn't do it. And I think it's too old for me to learn computer science.

Generally I'm — I think that the machine intelligence has worked. After all, a machine now can beat the best human player of Go. But I think there's more hype in that field than there is probable achievement.

So I don't think the world is going to be changed that much by machine intelligence. Some, but not hugely.

And what was the other question?

WARREN BUFFETT: Well —

CHARLIE MUNGER: One of them was machine intelligence.

WARREN BUFFETT: I think he was getting at capital allocation —

CHARLIE MUNGER: Oh yeah. That's such a general question. Generally speaking, we're always trying to get the best — to get something that's worth buying.

And the human mind rejects that if you're in academia, because you could come in and make one declaratory sentence at the opening of the semester and you wouldn't have anything to do for the rest of the — of your time. So people want to find some formula. It's what I call "physics envy." These people want the world to be like physics.

But the world isn't like physics, outside of physics. And that false precision just does nothing but get you in trouble.

So I would say you've got to master the general ideas, and you've got to work to improve your judgment slowly, the way all the rest of us had. And I don't think most individuals have much hope of individual gain from machine intelligence.

WARREN BUFFETT: No, I don't — I don't think that — I'm impressed when machines beat Go or something of the sort, or even win at chess or whatever it may be.

I don't really think they bring much to the table in terms of capital allocation or investing. And then I may be missing something entirely, you know, maybe I'm just blind to what's out there.

CHARLIE MUNGER: You're missing a lot of very remunerative, fee-earning twaddle. (Laughter)

WARREN BUFFETT: Yeah, well. Well, that takes care of that. So we'll go on to station 8. (Laughter)

27. Munger: "American investors are missing China"

AUDIENCE MEMBER: Dear Mr. Buffett and Mr. Munger, thank you very much for hosting the meeting. It's truly been remarkable. Thank you.

My name is Yen (PH), and I'm a partner at Tiger Brokers, a leading electronic brokerage firm from China.

Let me rephrase that. So, I and my colleagues flew half a way from the globe with (inaudible) to be here, and it is honor, just like everyone else in the stadium, we're honored to be here.

My question is, you mentioned earlier that investors don't really have to be struggling in picking the right stocks. They would do well in picking, probably, the right market and the right country.

China is the second-largest economy, and probably has the biggest growth potential. Just by passively weighting a portfolio — by passively valuating a portfolio — U.S. investors are significantly underweighting China. So in your opinion, what are stopping the investors from investing in China? Thank you.

CHARLIE MUNGER: Well, I think the answer is that you're absolutely right. That we are — American investors are missing China. And they're missing it because it's a long way away, it looks different, they're not used to it, it's complicated, the headlines confuse them.

In other words, it just looks too hard, sitting in Omaha, to outsmart the Chinese market. But I think you're absolutely right. It's where they should be looking.

WARREN BUFFETT: OK. (Laughter)

We've actually had a couple investments in China. We've done pretty well. But there were — well, if you go back a number of years, (inaudible).

In terms of getting a lot of money into something, you know, many billions, and we have to get billions into things in — to move any kind of a needle, that can be tougher in markets that you've got — you're unfamiliar working in. And it's difficult under any circumstances.

But accumulating a 6 or 8 or \$10 billion position in investments outside the United States can be very difficult. For example, in U.K. and much of Europe we have to report when we own 3 percent of a company. In fact, we can be asked to report if we even have less than 3 percent. That really gets very tough when we get a bunch of followers and a lot of publicity that probably isn't deserved in terms of what we're doing in the markets and everything.

Some of the problems are, just by the nature of our size. It would be lot — it'd be a lot easier if we were running a smaller fund.

PetroChina, we managed to get a very big position. But the government owned 90 percent of it. So we bought 14 percent of what the government didn't own, but it was still only 1.4 percent of the company.

But Charlie, Charlie actually keeps pushing me to do more in China. And we've tried a couple of times, actually. And there was one operation that we got involved in —

CHARLIE MUNGER: Well, you did so poorly the first time, you put in 200,000 and got about 2 billion, so.

WARREN BUFFETT: Yeah. Yeah. Well.

CHARLIE MUNGER: Wasn't encouraging enough. (LAUGHTER)

28. "What Jeff Bezos has done is something close to a miracle"

WARREN BUFFETT: OK. Station 9.

AUDIENCE MEMBER: My name is Dr. Sherman Silber. I'm an infertility doctor from St. Louis. And I've been a shareholder and coming to this meeting for 23 years, and I want to thank you very much for making my grandchildren very rich. (Laughter and applause)

And they sometimes compare me in the medical world — infertility world — as the Berkshire Hathaway of infertility, because I'm so old and I come from a relatively small community.

But I'm wondering about your interests in not just Apple, but all of the tech stocks, like Amazon and Google. Because you've avoided them, you've stated in the past, because they're complicated, you should stick with something you understand.

On the other hand, Amazon and Google have what you call a very durable competitive advantage. They really hardly have any competitor. And that's true in China, too, of Alibaba and Tencent.

So it seems like it's a conflict, and I'm wondering if you're going to be turning the corner and going into these tech companies that seem to have no serious competition.

WARREN BUFFETT: Well, we certainly looked at them. And we don't think of whether we should be in tech companies or not, or that sort of thing. We are looking for things when we do get into the durability of the competitive advantage, and whether we think that our opinion might be better than other people's opinion in assessing the probability of the durability, so to speak.

But the truth is that I've watched Amazon from the start, and I think what Jeff Bezos has done is something close to a miracle. And the problem is, if I think something will be a miracle, I tend not to bet on it. (Laughs)

It would have been better — far better, obviously — if we — if I had some insights into certain businesses.

But you know, in fact, Bill told me early on — Bill Gates told me early on — you know, that I think I was on AltaVista and he suggested I turn to Google.

But the trouble is I saw that Google was skipping past AltaVista, and then I wondered if anybody could skip past Google. And I saw at GEICO that we were paying a lot of money for something that cost them nothing incrementally.

We've looked at it, and you know, I made a mistake in not being able to come to a conclusion where I really felt that at the present prices that the prospects were far better than the prices indicated.

And I didn't go into Apple because it was a tech stock in the least. I mean, I went into Apple because I made certain — came to certain conclusions about both the intelligence with which

the capital would be employed, but more important, about the value of an ecosystem and how permanent that ecosystem could be, and what the threats were to it, and a whole bunch of things.

And that didn't — I don't think that required me to, you know, take apart an iPhone or something and figure out what all the components were or anything. It's much more the nature of consumer behavior. And some things strike me as having a lot more permanence than others.

But the answer is, we'll miss a lot of things that — or I'll miss a lot of things — that I don't feel I understand well enough.

And there is no penalty in investing if you don't swing at a ball that's in the strike zone, as long as you swing at something at some point, then you know, eventually that you find the pitches you like. And that's the way we'll continue to do it. We'll try to stay within our circle of competence.

And Charlie and I generally agree on sort of where that circle ends, and what kind of situations where we might have some kind of an edge in our reasoning or our experience or something that — where we might evaluate something differently than other people.

But the answer is, we're going to miss a lot of things.

Charlie?

CHARLIE MUNGER: Yeah, we have a wonderful system. If one of us is stupid in some area, so is the other. (Laughter)

And of course, we were not ideally located to be high-tech wizards. How many people of our age quickly mastered Google? I've been to Google headquarters. They look to me like they're — it looks like a kindergarten. (Laughter)

WARREN BUFFETT: A very rich kindergarten.

CHARLIE MUNGER: Yes. (Laughter)

WARREN BUFFETT: No, it's extraordinarily impressive, what they've done. And like I say, at GEICO we were paying them a lot of money at the time they went public. And all three of the main characters — Eric [Schmidt] and Larry [Page] and Sergey [Brin] — they actually came and saw me. But they were more interested in talking about going public and the mechanics of it and various things along that line.

But it wasn't like what they were doing was a mystery to me. The mystery was how much competition would come along, and how effective they would be, and whether it would be a

game where four or five people were slugging it out without making as much money as they could if one company dominated.

Those are tough decisions to make. You can have industries where there's only two people in it, and they still don't (inaudible) very good because they beat each other's brains out. And that's one of the questions in the airline business. It's a better business now than it used to be, but it used to be suicide, so — (Laughs)

And you know that the competitive factors are extraordinary in airlines, and how much better business is it with four people operating at 85 percent capacity than it was at — with seven or eight operating in the mid-70s, and with more planes run. Those are tough decisions.

But I made the wrong decision on Google. And Amazon, I just — I really consider that a miracle, that you could be doing Amazon web services and changing retail at the same time, with — you know, without enormous amounts of capital, and with the speed and effectiveness of what Amazon has done.

I just — I underestimated — I had a very, very, very high opinion of Jeff's ability when I first met him. And I underestimated him. (Laughs)

Charlie?

CHARLIE MUNGER: Well, my comment would be that the shareholders have one thing to be thankful for.

Some of the age-related stupidity at headquarters has been ameliorated by Ted and Todd joining us. We are looking at the world with the aid of some younger eyes now. And they've had a contribution —

WARREN BUFFETT: Significant.

CHARLIE MUNGER: — beyond their own investments. And so you're very lucky to have them be shareholders. Because there's a lot of ignorance in the older generation that needs removal. (Applause)

29. "We already have a family office. It's sitting right here"

WARREN BUFFETT: OK, station 10.

AUDIENCE MEMBER: Hi, good afternoon. Good afternoon, Warren. Good afternoon, Charlie. And my name is Ujean (PH). I come from China, and I work for (foreign language) family office. And we are serving high-worth individual clients in China. And you two would be my dream customer.

I know your shareholder Bill Gates has a family office, which, helping his wealth. So my question is, do you have a family office, and what — can we know what they do, some — anything for you? And if not, are you planning to have a family office in the future?

CHARLIE MUNGER: We already have a family office. It's sitting right here. (Laughter)

WARREN BUFFETT: Yeah, we would be the last guys in the world to have a family office, actually. (Laughter)

There are a lot of them around, and — but it's not something that fits the Munger family or the Buffett family. (Laughs)

Charlie, you have anything?

CHARLIE MUNGER: No.

WARREN BUFFETT: OK.

30. No “precise formulas” on Berkshire’s incentive plans

WARREN BUFFETT: Let's — we'll do one more. Station 11.

AUDIENCE MEMBER: Hi Warren, Charlie. My name is Adam Mead, Mead Capital Management from Derry, New Hampshire.

In the past you have touched on certain compensation arrangements with key executives. Could you please provide some specific examples of compensation arrangements within Berkshire that speak to incentivizing good behavior while not penalizing the manager for size or the relative ease or difficulty of the business or industry? Thank you.

WARREN BUFFETT: Well, that is a very, very good question, and a very, very tough question. Because some of our —

CHARLIE MUNGER: He really doesn't want to answer.

WARREN BUFFETT: Well, some of our managers — (Laughter)

No, some of our managers are in businesses that are just much easier. I mean, we bought into a variety of businesses. People are obviously influenced by what pay arrangements are elsewhere. They wouldn't be human if they weren't.

And trying to come to the right answer when you have different degrees of capital intensity, different degree — very different degrees — of basic profitability, and how much you scale up based on size, because there is an incentive to grow businesses. Usually if businesses get much

larger, everybody from the CEO down expects to earn more money for something that — where they really bring the same amount of intensity and work and (inaudible) to it.

It is really a tough question. I think that if you engage compensation consultants at public companies, which they all do, they're going to recommend things that cause them to have CEOs recommend them to other companies. (Laughs)

It's just, you're working against human nature when you have an arrangement like that.

I would say that we have obviously kept a very, very, very high percentage of the managers that we hoped to have stay with us. In fact, just about a hundred percent. It's —

And I think people do like — they do like to make their own decisions. They do like recognition. You know, they — most people respond — they like doing a good job, and they like the fact that we understand it. And compensation's part of that. But it's not the whole thing.

And I wish I could give you some precise formulas, but there aren't any —

CHARLIE MUNGER: No, you really don't, Warren.

WARREN BUFFETT: What?

CHARLIE MUNGER: It's an advantage at Berkshire to keep our individual deals private. There would be no advantage to just publishing them all.

WARREN BUFFETT: No, we're not going to do that.

CHARLIE MUNGER: No, of course not. So what we're saying, he makes all those decisions personally. He's got every formula in the book. And he keeps them all private. That's our system. (Laughter)

WARREN BUFFETT: Well, we do — (Laughter)

We publish what the directors are paid.

CHARLIE MUNGER: We publish what we have to, yes.

WARREN BUFFETT: OK. It's 3:30 now. We're going to reconvene at 3:45.

Charlie and I, we love the fact that our partners basically turn out for this. So we thank you for coming. I hope you've had a good time, both at the meeting and in Omaha. And we look forward to seeing you again next year. Thanks. (Applause)

31. Formal business meeting

WARREN BUFFETT: We're going to move it right along, with a little (inaudible) copy here.

If you'll please take your seat, thank you.

This is the formal meeting, so the meeting will now come to order.

I'm Warren Buffett, chairman of the board of directors of the company, and I welcome you to this 2018 annual meeting of shareholders.

This morning, I introduced the Berkshire Hathaway directors that are present and also with today are partners in the firm of Deloitte & Touche, our auditors.

Jennifer Tselentis is the assistant secretary of Berkshire Hathaway. She will make a written record of the proceedings.

Becki Amick has been appointed inspector of elections at this meeting, and she will certify to the count of votes cast in the election for directors and the motions to be voted upon at the meeting.

The named proxy holders for this meeting are Walter Scott and Marc Hamburg. Does the assistant secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

VOICE: This is the important part.

VOICE: You sit there.

WARREN BUFFETT: We're building the suspense here. (Laughs)

JENNIFER TSELENTIS: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 7th, 2018, the record date for this meeting, there were 748,347 shares of Class A Berkshire Hathaway common stock outstanding with each share entitled to one vote on motions considered at the meeting, and 1,344,969,701 shares of Class B Berkshire Hathaway common stock outstanding with each share entitled to 1/10,000th of one vote on motions considered at the meeting.

Of that number, 537,524 Class A shares and 823,145,874 Class B shares are represented at this meeting by proxies returned through Thursday evening May 3rd.

WARREN BUFFETT: Thank you. That number represents a quorum. And we will therefore directly proceed with the meeting.

First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second?

RON OLSON: I second the motion.

WARREN BUFFETT: Motion has been moved and seconded. We will vote on this motion by voice vote. All those in favor say aye.

VOICES: Aye.

WARREN BUFFETT: Opposed. The motion is carried.

The next item of business is to elect directors. If a shareholder is present who did not send in a proxy or wishes to withdraw a proxy previously sent in, you may vote in person on the election of directors and other matters to be considered at this meeting. Please identify yourself to one of the meeting officials in the aisles so that you can receive a ballot.

I recognize Mr. Walter Scott to place a motion before the meeting with respect to the election of directors.

WALTER SCOTT: I move that Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Stephen Burke, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ron Olson, Walter Scott, and Meryl Witmer be elected as directors.

WARREN BUFFETT: Is there a second?

RON OLSON: I second the motion.

WARREN BUFFETT: It has been moved and seconded that Warren Buffett, Charles Munger, Gregory Abel, Howard Buffett, Stephen Burke, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ronald Olson, Walter Scott, and Meryl Witmer be elected as directors. Are there any other nominations or any discussion?

The nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and deliver their ballots to one of the meeting officials in the aisles. Miss Amick, when you are ready you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast not less than 605,906 votes for each nominee. That number exceeds a majority of the number of the total votes of all Class A and Class B shares outstanding. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. Warren Buffett, Charles Munger, Gregory Abel, Howard Buffett, Steve Burke, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ron Olson, Walter Scott, and Meryl Witmer have been elected as directors.

32. Shareholder motion on methane emissions

WARREN BUFFETT: The next item of business is a motion put forth by Freeda Cathcart on behalf of shareholder Marcia Sage. The motion is set forth in the proxy statement. The motion requests that the company provide a report revealing the company's policies, actions, plans, and reduction targets related to methane emissions from all operations.

The directors have recommended that the shareholders vote against the proposal.

I will now recognize Miss Cathcart to present the motion. To allow all interested shareholders their views, I ask that the representative of the Baldwin Brothers limit the presentation of the motion to five minutes.

FREEDA CATHCART: Good morning Chairman Buffett, Mr. Munger, members of the board and fellow shareholders. I am presenting this proposal on behalf of Baldwin Brothers on the issue of methane asset risk. This is the second year for this methane-focused proposal. Last year 10 percent of shareholders approved of it.

Methane asset risk is a serious financial safety and environmental issue across the entire natural gas supply chain. The failure of a gas injection well at Southern California Gas Aliso Canyon Storage facility in Los Angeles revealed major vulnerabilities in the maintenance and safety of natural gas facilities.

In that situation, cleanup and containment costs have soared to close to \$1 billion. Governor Jerry Brown of California has threatened to shut down the facility.

Berkshire Hathaway owns the largest interstate natural gas pipeline system in the United States. It has natural gas storage distribution and transportation facilities that may face similar safety risks through the Northern Natural Gas Company, Kern River Gas, and Mid-American Energy Corporations.

On an environmental front, research indicates methane leaks could erase the climate benefits of reducing coal use to meet internationally agreed upon climate change targets. Methane emissions have an impact on global temperature of roughly 84 times that of CO₂ over a 20-year period.

Berkshire is a voluntary member of the EPA's Methane Challenge and ONE Future Emissions Intensity Commitment Framework and should be applauded for reducing its leakage rates to below the 1 percent target along its value chain.

Since this framework is a cost-effective versus prescriptive approach, shareholders would like to understand if this cost-effective approach employed at Berkshire is sufficient — maintenance and enhanced disclosure should help mitigate the potential for these financial and regulatory risks.

In closing, we think it prudent that Berkshire Hathaway issue a report revealing and disclosing the company's specific best practices, policies, and safety standards for methane assets and required upgrade costs to facilities to mitigate potential business risks.

The report would make it easier for investors, customers, and regulators to understand Berkshire's overall approach to managing methane emissions and risks. Thank you for your consideration.

WARREN BUFFETT: Miss Cathcart, could you help me out? Are there some other people that are there to speak? I can't quite see from here.

VOICE: No, there are no other shareholders who wish to speak on this issue.

FREEDA CATHCART: There's nobody behind me to speak.

WARREN BUFFETT: Did you get that, Charlie?

CHARLIE MUNGER: No.

WARREN BUFFETT: Greg — could we put up slide one and then if somebody will give Greg a microphone, that'd be helpful. He could elaborate some on this chart and knows what we're doing.

GREG ABEL: OK. Thanks, Warren and appreciate the comments there. What we've prepared here is in response to the proposal. It demonstrates the ONE Future Initiative goal as it was highlighted. They'd like to see our pipelines operating by 2025 at a 1 percent throughput — or a loss of throughput at 1 percent.

I'm happy to report, as this slide shows, that in 2017 our throughput loss was 0.046 percent, 20 times better than the request in 2025. (Applause)

Thank you. It's a great compliment to our operating team, obviously. They take the issue that has been highlighted very seriously. I would also add, as it was noted, we're part of the EPA program where we report on a voluntary basis. Our practices are disclosed and reviewed by the EPA and additionally added on our website.

Accordingly, I strongly feel we're getting the results and disclosing the appropriate information. Thank you.

WARREN BUFFETT: Yeah, and thanks Greg. And Miss Cathcart, we are on the same side you are on this basically. We just are not looking for ways to conduct more studies and prepare reports that may cost us money and generate more reports and all that. But I can tell you two things.

This is something that is reported to the board of directors of Berkshire Hathaway Energy quarterly. And I'm on that board. And we believe in achieving the same (inaudible) and we think Berkshire Hathaway Energy is both sensitive and effective — sensitive to and effective — in reducing methane emissions.

So if — I think we're now ready. The motion is now ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the motion and deliver their ballot to one of the meeting officials in the aisles. Miss Amick, when you're ready, you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast 48,040 votes for the motion and 558,640 votes against the motion.

As the number of votes against the motion exceeds a majority of the number of votes of all Class A and Class B shares properly cast on the matter, as well as all votes outstanding, the motion has failed. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. The proposal fails.

33. Shareholder proposal on sustainability reports

WARREN BUFFETT: The next item of business is a motion put forth by shareholder Freeda Cathcart. The motion is set forth in the proxy statement. The motion requests that Berkshire adopt a policy to encourage more Berkshire subsidiary companies to issue annual sustainability reports.

I will now recognize Freeda Cathcart to present the motion, and to all interested shareholders to present their views I ask her to limit her remarks to five minutes. You have the floor, Miss Cathcart.

FREEDA CATHCART: Thank you so much. It is a privilege to be here and a privilege I can give thanks to my grandfather James Cathcart, who started out in the mailroom of Gen Re and worked himself up through the company to become the chair of Gen Re. During that time he accumulated a lot of Gen Re stock, which he bestowed generously upon his family.

And when he did so, he encouraged the members of his family to do good and to pay it forward, to do something that would make a difference in the world and in our communities. For my father, he did so by being philanthropic with educational institutions with the theory

that if you give a person a fish you feed them for a day, but if you teach them to fish, you feed them for a lifetime.

My focus has been on the environment with the thought that when people fish, it would be nice if they were able to eat the fish.

I want to take this opportunity to clarify my proposal about the sustainability reports and put the emphasis on the word encourage. It is evident that Berkshire Hathaway's management of allowing the subsidiaries to work without getting guidance — well, mandates from you is being very successful.

And I wouldn't recommend changing it. You're doing a great job. Please keep it up.

But I do think that there's something to be said to encourage them and support them, and in many ways you already are.

There is a high level of interest from investors and the public in corporate social responsibility. One-fifth of investments are based on socially responsible investment strategies. And back in 2012, I found an article by Planet Earth Herald where they wrote, "When Warren Buffett talks, people listen. He is now talking about the environment. He believes that companies need to have a triple bottom line. And respecting the environment is absolutely critical to a company's economic performance."

In times — and this is a direct quote from you, Mr. Buffett, "In times such as these a company must invest in the key ingredients of profitability: its people, communities, and the environment."

One-third of Berkshire Hathaway's subsidiaries already have a sustainability presence on the web. And one of them is Berkshire Energy that has the acronym respect, R-E-S-P-E-C-T, which stands for Responsibility, Efficiency, Stewardship, Performance, Communication, and Training.

And Berkshire Hathaway provides an annual sustainability summit to help bring the subsidiaries together so they can learn how to be more sustainable, how to share tips, and how to be profitable. And that's excellent.

But when I try to find a web presence about the sustainability summit, I wasn't able to find it. And that's where I think that we can do a better job in Berkshire Hathaway when it comes to communication with our shareholders and with the outside world about the good work that we're doing.

A simple solution to that would just be to create a link on the Berkshire Hathaway website to sustainability that people could click on and go and find out about initiatives like the sustainability summit. And from there, perhaps, they could click on to go to the subsidiaries that have a web presence about sustainability to see what they're doing.

In doing so, we give a window to the world where they can see what we're doing to make a difference that might inspire other corporations to follow the example. Or perhaps a college student working on a paper would read about it and think that that is a good business model, that that's something that he wants to bring forward when he goes into his career.

There is a Facebook page called "Berkshire Hathaway's Sustainability" that will be available for shareholders and the outside world to look at to see research and to encourage each other to learn how we can support sustainability practices. And that is available now.

I greatly appreciate this opportunity to speak with you today and to clarify what my proposal is. And I do greatly applaud and appreciate all the work that you're doing on behalf of our corporation and the world. Thank you so much.

WARREN BUFFETT: And thank you. (Applause)

Many of the managers — a great many of the managers — of Berkshire are here and are listening to you. And I suspect that a very high percentage of them agree with what you're saying. Whether they — what they do in terms of web pages and so on, in our view, is basically up to them.

But I can tell you that one leading proponent, as you mentioned, was Greg Abel, who until recently was running Berkshire Hathaway Energy and now is vice chairman. And Greg may want to say a few words on this, too. But I can assure you that the managers are listening to you.

GREG ABEL: Thanks, Warren. Yeah, we do everything that was touched on. I'll just maybe add a few points for our shareholders. Obviously, sustainability is a priority for Berkshire and each of our operating subsidiaries. It was highlighted that a number of them have sustainability reports. But I would go beyond that. If you go to our various companies' websites, you'll see specific actions they're taking relative to sustainability. So it may not be summarized in a specific report, but that type of information is available.

I can also add that when you think of the Berkshire Hathaway Energy Corporation, we're trying to lead by example with support from Warren, Charlie, Walter Scott. I'm happy to report, if you look at where our energy production is right now at the end of 2017, 50 percent of our energy that is produced and consumed by our customers comes from renewable energy.

That's something we're strongly communicating across the U.S. and globally as an example of what can be done in our industry. And I'm happy to report by the end of 2021, 100 percent of the energy utilized by our customers can be met through renewable energy in Iowa.

So I understand the concept of sustainability. We're working across our organizations to share best practices. But as Warren highlighted, it really resides in each of our companies. But it will be encouraged and you'll continue to see great results. Thank you.

WARREN BUFFETT: Thank you. (Applause)

The motion is now ready to be acted upon. If there are any shareholders voting in person they should now mark their ballot on the motion and deliver their ballot to one of the meeting officials in the aisles.

Miss Amick, when you're ready you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast 67,282 votes for the motion and 544,256 votes against the motion.

As the number of votes against the motion exceeds a majority of the number of votes of all Class A and Class B shares properly cast on the matter, as well as all votes outstanding, the motion has failed. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. And I would say Miss Cathcart, our managers heard you. I mean, you have had an impact and I appreciate what you have done.

Walter, I guess we're now ready for a motion?

WALTER SCOTT: I move that this meeting be adjourned.

WARREN BUFFETT: Is there a second?

RON OLSON: I second the motion.

Morning Session - 2019 Meeting

1. Welcome and Munger's insurgency campaign

WARREN BUFFETT: Thank you.

Good morning and welcome to Berkshire Hathaway.

And for those of you who have come from out of state, welcome to Omaha. The city is delighted to have you here at this event.

And for those of you who came from outside of the country, welcome to the United States.

So, we've got people here from all over the world. We've got some overflow rooms that are taking care of people. And we will just have a few preliminaries and then we will move right into the Q&A period.

We'll break about noon for about an hour. We'll come back and do more Q&A until about 3:30. Then we'll adjourn for a few minutes, and then we'll conduct the meeting.

I understand that in the room adjacent, that Charlie has been conducting a little insurgency campaign.

I don't know whether you've seen these, but these are the buttons that are available for those of you — you keep asking questions about succession. And Charlie wants to answer that question by getting your vote today. So, it says — this one says, "Maturity, experience, why accept second best? Vote for Charlie." (Laughter)

I, however, have appointed the monitors who have — collect the votes, so I feel very secure. (Laughter)

2. Berkshire directors introduced

WARREN BUFFETT: The first thing I'd like to do — Charlie is my partner of 60 years, a director and vice chairman, and we make the big decisions jointly. It's just that we haven't had any big decisions. So, (laughter) we haven't — we're keeping him available for the next big one.

But now at the formal meeting today, we'll elect 14 directors, and you're looking at two of them. And I'd like to introduce the 12 that will be on the ballot at 3:45.

And I'm going to proceed alphabetically. And if they'll stand. If you'll withhold your applause because some of them get sensitive if certain people get more applause than others, and (Laughter) they'll — and if you'll withhold it till I'm finished, then you can applaud or not, as you see fit, having looked at these directors. (Laughter)

So, we'll start on my left. Greg Abel, who's both a chairman and a director. Greg? Yeah, oh, there we are. Right, OK. And going along alphabetically, Howard Buffett, Steve Burke, Sue Decker, Bill Gates, Sandy Gottesman— (applause) — Charlotte Guyman, Ajit Jain, who is also a vice chairman, Tom Murphy, Ron Olson, Walter Scott, and Meryl Witmer. Now you can applaud. (Applause)

3. Berkshire's Q1: Pay attention to operating earnings

WARREN BUFFETT: Now, this morning we posted on our website the quarterly, the 10Q that's required to be filed with the SEC. We published it at 7 o'clock Central Time. And we also published an accompanying press release.

And if we'll put slide one up — these figures as usual require some explanation. As we've mentioned in the annual report, the new GAAP rule of Generally Accepted Accounting Principles require that we mark our securities to market and then report any unrealized gains in our earnings.

And you can see, I've warned you about the distortions from this sort of thing. And, you know, the first quarter of 2019 actually was much like the first quarter of 2018, and I hope very much that newspapers do not read headlines saying that we made \$21.6 billion in the first quarter this year against a loss of last year.

These — the bottom line figures are going to be totally capricious, and what I worry about is that not everybody studied accounting in school, or they can be very smart people but that doesn't mean that they've spent any real time on accounting.

And I really regard these bottom line figures, particularly if they're emphasized in the press, as doing — as potentially being harmful to our shareholders, and really not being helpful. So, I encourage you now, and I encourage all the press that's here, focus on what we call our operating earnings, which were up a bit. And forget about the capital gains or losses in any given period.

Now, they're enormously important over time. We've had substantial capital gains in the future; we have substantial unrealized capital gains at the present time; we expect to have more capital gains in the future.

They are an important part of Berkshire, but they have absolutely no predictive value or analytical value on a quarterly basis or an annual basis. And I just hope that nobody gets misled in some quarter when stocks are down and people say, "Berkshire loses money," or something of the sorts. It's really a shame that the rules got changed in that way, but we will report.

But we will also explain, and we will do our best to have the press understand the importance of focusing on operating earnings, and that we do not attract shareholders who think that there's some enormous gain because in the first quarter the stock market was up.

There's one other footnote to these figures that I should point out. It's already been picked up by the wires from our 7 o'clock filing.

We report on Kraft Heinz, of which we own about 27 percent or so. We report on what they call the equity method. Now, most stocks, when you get dividends, that goes into our earnings account, and their undistributed earnings don't affect us. They affect us in a real way, but they don't affect us in an accounting way.

We are part of a control group at Kraft Heinz, so instead of reporting dividends, we report what they call equity earnings.

Kraft Heinz has not filed their 10K for the 2018 year with the SEC. And therefore, they have not released the first quarter of 2019 earnings. Now, normally, we would include our percentage share of those earnings, and we've done that every quarter up till this quarter. But because we do not have those figures, we've just — we've not included anything.

We received 40 cents times — \$130 million of dividends in the first quarter from our shares, but that reduces our carrying basis and it is not reflected in the earnings. So, that's an unusual item which we have mentioned, specifically pointed out in our press release as well as included in our own.

But there is nothing in here, plus or minus, for Kraft earnings, Kraft Heinz earnings this year, whereas there was last year. And when we have the figures, obviously we will report them. Let's see what beyond that I want to tell you.

4. Berkshire signs 20-year lease for its Omaha headquarters

WARREN BUFFETT: I think — oh yes, I'd wanted to mention to you, the Kiewit Company, which has been our landlord since 1962 — 57 years — has owned the building in which Berkshire is headquartered.

Kiewit Company is moving their headquarters and, in the process, will be doing something with the building. And they very generously, as they always have been, they came and said, "What kind of a lease would you like? Since we're leaving, and we've always sort of worked these things out as we've gone along." And so Bruce Grewcock, who runs Kiewit, said, "You just sort of — you name your terms and what you'd like. So, you — no matter what happens with the building, you're all set."

So, I was about to sign a ten-year lease for the present space, but Charlie said, "Ten years might be long enough for me but," he said he would like me to sign one for 20 years, considering.

And — so we are entering a 20-year lease, and I confess to you that we now occupy one full floor, as we have for decades, and the new lease provides for two floors. So, I just want you to know that your management is loosening up just a little bit. (Laughter)

And whether or not we fill them is another question. But we will have that, and I would like to say to Omaha that I think the fact that Berkshire has signed up for 20 years is very good news for the city over time. It — (Applause) OK.

5. Berkshire employees pitch in for annual meeting

WARREN BUFFETT: And now I would like to tell you something about the people that make all of this possible. This is totally a — this is a homegrown operation.

We started with a few people, meeting in the lunchroom at National Indemnity many years ago. And I think we will probably set another record for attendance today. Yesterday afternoon, 16,200 people came in five hours, and that broke the previous record by a couple thousand.

On Tuesday, the Nebraska Furniture Mart did \$9.3 million worth of business. And if any of you are in the retail business, you'll know that that's the yearly volume for some furniture stores, and here in Omaha, the 50th or so largest market in the country, maybe even a little less, \$9.3 billion (million) I think probably exceeds anything any home furnishing store's ever done in one day.

And we have people pitching, and we have all the people, virtually all of the people from the home office, some of them, you know, are — they'll take on any task. We have a bunch of people from National Indemnity, for example, that come over, and they've been some of the monitors around.

And in terms of the exhibit hall, more than 600 people from our various subsidiaries give up a weekend to come to Omaha, work very hard, and tomorrow, 4:00 or 4:30, or I should say today at 4:00 or 4:30, they will start packing up things and heading back home. And they come in, and I saw them all yesterday, and they were a bunch of very, very happy, smiling faces. And, you know, they work hard all year, and then they come in and help us out on this meeting.

And then, finally, if we could get a spotlight, I think Melissa Shapiro is someplace here — she runs the whole show. I mean, we — Melissa, where are you? (Applause)

Melissa's name was Melissa Shapiro before she got married, then she married a guy named Shapiro, so now she's Melissa Shapiro Shapiro. So — (Laughter) but she can handle that sort of thing. She handles everything, and never — totally unflappable. Totally organized. Everything gets done. Everybody likes her when they get through. So, I — it's marvelous to get a chance to work with people like this.

I think it's a special quality that — at Berkshire. I think other people would hire some group to put on the meeting and all be very professional and all of that. But I don't think you can get — I don't think you can buy the enthusiasm and energy and help-the-next-guy feeling that you've seen out on that exhibition floor, and you'll see as you meet people here at the hall, and as you meet the people around Omaha. They're very, very happy that you're here.

6. Q&A Begins

WARREN BUFFETT: And with that, I would like to start on the questions. We'll do it just as we've done it in recent years. We'll start with the press group. They've received emails from a great many people — perhaps they can tell you how many — and selected the questions they think would be most useful to the Berkshire shareholders.

Yahoo is webcasting this as they've done for several years now, they've done a terrific job for us.

So, this meeting is going out, both in English and in Mandarin, and I hope our results translate well, or our — (laughs) our comments translate well. Sometimes we have trouble with English. But we're going to — we'll start in with Carol Loomis, my friend of 50 years, but you'll never know it by the questions she's going to ask me. (Laughter)

CAROL LOOMIS: I'm going to start, very briefly — this is for the benefit of people who send us questions next year. There are kind of two things that you get wrong a lot of the time. You can't send two-part questions or three-part, et cetera. We need a one-part question. And the other thing is the questions all need to have some relevance to Berkshire, because Warren said when he started it that his hope was that shareholders would come out of the questions with a further education about the company. So, keep those in mind for next year.

7. Munger: "I predict we'll get a little more liberal in repurchasing shares"

CAROL LOOMIS (RETIRED FORTUNE MAGAZINE EDITOR): Many people — a number of people — wrote me about repurchases of stock. And, hence, the question I picked for my first one.

The question, this particular question comes from Ward Cookie (PH), who lives in Belgium and who was still emailing me this morning in reference to the first quarter report.

And he asked, "My question concerns your repurchase of Berkshire shares. In the third quarter of last year, you spent almost 1 billion buying Berkshire B stock at an average price of \$207.

"But then you got to a period between December 26th and April 11th when the stock languished for almost four months under 207. And yet, you purchased what I think of as a very limited amount of stock, even as you were sitting on an enormous pile of 112 billion.

"My question is why you did not repurchase a lot more stock? Unless, of course, there was for a time an acquisition of, say, 80 billion to 90 billion on your radar."

WARREN BUFFETT: Yeah, the question — whether we had 100 billion or 200 billion would not make a difference — or 50 billion — would not make a difference in our approach to repurchase of shares.

We repurchase shares — we used to have a policy of tying it to book value. But that became — really became obsolete. It did not —

The real thing is to buy stock — repurchase shares — only when you think you're doing it at a price where the remaining shareholders have had — are worth more the moment after you repurchased it than they were the moment before.

It's very much like if you were running a partnership and you had three partners in it and the business was worth 3 million, and one of the partners came and said, "I'd like you to buy back my share of the partnership for a billion" — I started out with millions, so I'll stay with millions — "for \$1.1 million?" And we said, "Forget it." And if he said, "1 million?" we'd probably say, "Forget it," unless — and if he said, "900,000," we'd take it because, at that point, the remaining business would be worth 2-million-1, and we'd have two owners, and our interest in value would have gone from a million to a million and fifty-thousand.

So, it's very simple arithmetic. Most companies adopt repurchase programs and they just say, "We're going to spend so much." That's like saying, you know, "We're going to buy XYZ stock, and we're going to spend so much here." "We're going to buy a company." "We're going to spend whatever it takes."

We will buy stock when we think it is selling below a conservative estimate of its intrinsic value. Now, the intrinsic value is not a specific point, it's probably a range in my mind that might have a band maybe of 10 percent. Charlie would have a band in his mind, and it would probably be 10 percent. And ours would not be identical, but they'd be very close. And sometimes he might figure a bit higher than I do, a bit lower.

But we want to be sure, when we repurchase shares, that those people who have not sold shares are better off than they were before we repurchased them. And it's very simple.

And in the first quarter of the year, they'll find we bought something over a billion worth of stock, and that's nothing like my ambitions. But it — what that means is that we feel that we're OK buying it, but we don't salivate over buying it.

We think that the shares we repurchased in the first quarter leave the shareholders better off than if we hadn't — the remaining shareholders — better off than if we hadn't bought it. But we don't think the difference is dramatic.

And you will — you could easily see periods where we would spend very substantial sums if we thought the stock was selling at, say, 25 or 30 percent less than it was worth, and we didn't have something else that was even better.

But we have no ambition in any given quarter to spend a dime unless we think you're going to be better off for us having done so. Charlie?

CHARLIE MUNGER: Well, I predict that we'll get a little more liberal in repurchasing shares.
(Laughter)

WARREN BUFFETT: I was going to give you equal time, but then — (Laughter)

8. BNSF may adopt “precision-scheduled railroading”

WARREN BUFFETT: OK, Jon Brandt.

JONATHAN BRANDT (RESEARCH ANALYST, RUANE, CUNNIFF & GOLDFARB): Hi, Warren and Charlie. Thanks for having me, as always.

Every major North American railroad other than Burlington Northern has adopted at least some aspects of precision-scheduled railroading, generally to good effect to their bottom line.

Some believe that point-to-point schedule service and minimal in-transit switching is good for both returns on capital and customer service.

Others believe precision railroading has done little for on-time performance, and its rigidity has jeopardized the compact that railroads have had with both regulators and customers.

Do you and current BNSF management believe that it's now a good idea for BNSF to adopt precision railroading playbook? Or do you agree with its critics?

WARREN BUFFETT: Yeah, precision railroading, as it's labeled, was probably invented by a fellow named Hunter Harrison. I think maybe he was at the Illinois Central Railroad at the time; there's a book that came out about Hunter, who died maybe a year ago or thereabouts. And it describes the — his procedure toward railroading. It's an interesting read if you're interested in railroading.

And he took that to Canadian National, CN. There are six big railroads in North America, and he took that to CN, and he was very successful.

And actually, Bill Gates is probably the largest holder of CN, and I think he's done very well with that stock.

And then later, Canadian Pacific was the subject of an activist, and when they — as they proceeded, they got Hunter to join them and brought in an associate, Keith Creel, who — and they instituted a somewhat similar program. Now the same thing has happened at CSX.

And all of those companies dramatically improved their profit margins, and they had varying degrees of difficulty with customer service in the implementing of it.

But I would say that we watch very carefully — Union Pacific is doing a somewhat modified version. But the — we are not above copying anything that is successful. And I think that there's been a good deal that's been learned by watching these four railroads, and we will — if we think we can serve our customers well and get more efficient in the process, we will adopt whatever we observe.

But we don't have to do it today or tomorrow, but we do have to find something that gets at least equal, and hopefully better, customer satisfaction and that makes our railroad more efficient. And there's been growing evidence that — from the actions of these other four railroads — there's been growing evidence that we can learn something from what they do. Charlie?

CHARLIE MUNGER: Well, I doubt that anybody is very interested in un-precision in railroading. (Laughter)

WARREN BUFFETT: Well, Jonny, has Charlie answered your question? (Laughter)

JONATHAN BRANDT: Yes, thank you.

9. BNSF trying to improve energy efficiency

WARREN BUFFETT: OK. Station number 1, from the shareholder group up on my far right.

AUDIENCE MEMBER: Good morning. My name is Bill Moyer and I'm from Vashon Island, Washington. And I'm part of a team called "The Solutionary Rail Project."

Interestingly, only 3.5 percent of the value of freight in the U.S. moves on trains. Berkshire Hathaway is incredibly well positioned with its investments in the northern and southern transcon through BNSF to grab far more of that freight traffic off of the roads and get diesel out of our communities, as well as harness transmission corridors for your Berkshire renewable energy assets, for which you're obviously very proud.

Would you consider meeting with us to look at a proposal for utilizing your assets and leveraging a public/private partnership to electrify your railroads and open those corridors for a renewable energy future?

WARREN BUFFETT: No, I — we've examined a lot of things in terms of LNG. I mean, they're — obviously, we want to become more energy efficient, as well as just generally efficient.

And I'm not sure about the value of freight. You mentioned 3 1/2 percent. I believe — I mean, I'm not sure what figure you're using as the denominator there.

Because if you look at movement of traffic by ton miles, rails are around 40 percent of the U.S. — we're not talking local deliveries or all kinds of things like that — but they're 40 percent, roughly, by rail.

And BNSF moves more ton miles than any other entity. We move 15 percent-plus of all the ton miles moved in the United States.

But if you take trucking, for example, on intermodal freight, we're extremely competitive on the longer hauls, but the shorter the haul, the more likely it is that the flexibility of freight, where a truck can go anyplace and we have rails. So, the equation changes depending on distance hauled and other factors, but distance hauled is a huge factor.

We can move a ton mile 500 — we can move 500-plus ton miles of freight for one gallon of diesel. And that is far more efficient than trucks.

So, the long-haul traffic, and the heavy traffic, is going to go to the rails, and we try to improve our part of the equation on that all the time.

But if you're going to transport something ten or 20 or 30 miles between a shipper and a receiver, and they're — you're not going to move that by rail.

So, we look at things all the time, I can assure you.

Carl Ice is in — well, he's probably here now, and he'll be in the other room — and he's running the railroad. You're free to talk to him, but I don't see any breakthrough like you're talking about. I do see us getting more efficient year-by-year-by-year.

And obviously, if driverless trucks become part of the equation, that moves things toward trucking. But on long-haul, heavy stuff, and there's a lot of it, you're looking at the railroad that carries more than any other mode of transportation. And BNSF is the leader. Charlie?

CHARLIE MUNGER: Well, over the long term, our questioner is on the side of the angels. Sooner or later, we'll have it more electrified. I think Greg (Abel) will decide when it happens.

WARREN BUFFETT: Yeah. But we're all working on the technology but —

And we're considerably more efficient than ten, 20, 30 years ago, if you look at the numbers. But it —

One interesting figure, I think right after World War II, when the country probably had about 140 million people against our 330 million now, so we had 40 percent of the population. We had over a million-and-a-half people employed in the railroad industry. Now there's less than 200,000 and we're carrying a whole lot more freight.

Now, obviously there's some change in passengers. But the efficiency of the railroads compared to — and the safety — compared to what it was even immediately after World War II has improved dramatically. Charlie, anything more?

CHARLIE MUNGER: No.

10. Bank CEOs who make bad mistakes should lose all their net worth

WARREN BUFFETT: OK, Becky?

BECKY QUICK (CNBC): This is a question that comes from Mike Hebel. He says, "The Star Performers Investment Club has 30 partners, all of whom are active or retired San Francisco police officers. Several of our members have worked in the fraud detail, and have often commented after the years-long fraudulent behavior of Wells Fargo employees, should have warranted jail sentences for several dozen, yet Wells just pays civil penalties and changes management.

"As proud shareholders of Berkshire, we cannot understand Mr. Buffett's relative silence compared to his vigorous public pronouncement many years ago on Salomon's misbehavior. Why so quiet?"

WARREN BUFFETT: Yeah, I would say this. The — (applause) — problem, well, as I see it — although, you know, I have read no reports internally or anything like that — but it looks like to me like Wells made some big mistakes in what they incentivized. And as Charlie says, there's nothing like incentives, but they can incentivize the wrong behavior. And I've seen that a lot of places. And that clearly existed at Wells.

The interesting thing is, to the extent that they set up fake accounts, a couple million of them, that had no balance in them, that could not possibly have been profitable to Wells. So, you can incentivize some crazy things.

The problem is — I'm sure is that — and I don't really have any inside information on it at all — but when you find a problem, you have to do something about it. And I think that's where they probably made a mistake at Wells Fargo.

They made it at Salomon. I mean, John Gutfreund would never have played around with the government. He was the CEO of Salomon in 1991. He never would have done what the bond trader did that played around with the rules that the federal government had about government bond bidding.

But when he heard about it, he didn't immediately notify the Federal Reserve. And he heard about it in late April, and May 15th, the government bond auction came along. And Paul Mozer did the same thing he'd done before, and gamed the auction.

And at this point, John Gutfreund — you know, the destiny of Salomon was straight downhill from that point forward. Because, essentially, he heard about a pyromaniac, and he let him keep the box of matches.

And at Wells, my understanding, there was an article in The Los Angeles Times maybe a couple years before the whole thing was exposed, and, you know, somebody ignored that article.

And Charlie has beaten me over the head all the years at Berkshire because we have 390,000 employees, and I will guarantee you that some of them are doing things that are wrong right now. There's no way to have a city of 390,000 people and not need a policeman or a court system. And some people don't follow the rules. And you can incentivize the wrong behavior. You've got to do something about it when it happens.

Wells has become, you know, exhibit one in recent years. But if you go back a few years, you know, you can almost go down — there's quite a list of banks where people behaved badly. And where they — I would not say — I don't know the specifics at Wells — but I've actually written in the annual report that they talk about moral hazard if they pay a lot of people.

The shareholders of Wells have paid a price. The shareholders of Citicorp paid a price. The shareholders of Goldman Sachs, the shareholders of Bank of America, they paid billions and billions of dollars, and they didn't commit the acts. And of course, nobody did go — there were no jail sentences. And that is infuriating.

But the lesson that was taught was not that the government bailed you out because the government got its money back, but the shareholders of the various banks paid many, many billions of dollars.

And I don't have any advice for anybody running a business except, when you find out something is leading to bad results or bad behavior, you know, you — if you're in the top job, you've got to take action fast.

And that's why we have hotlines. That's why we get — when we get certain anonymous letters, we turn them over to the audit committee or to outside investigators.

And we will have — I will guarantee you that we will have some people who do things that are wrong at Berkshire in the next year or five years, ten years, and 50 years. It's — you cannot have 390,000 people — and it's the one thing that always worries me about my job, but — because I've got to hear about those things, and I've got to do something about them when I do hear about them. Charlie?

CHARLIE MUNGER: Well, I don't think people ought to go to jail for honest errors of judgment. It's bad enough to lose your job. And I don't think that any of those top officers was deliberately malevolent in any way. I just — we're talking about honest errors in judgment.

And I don't think (former Wells Fargo CEO) Tim Sloan even committed honest errors of his judgment, I just think he was an accidental casualty that deserve the trouble. I wish Tim Sloan was still there.

WARREN BUFFETT: Yeah, there's no evidence that he did a thing. But he stepped up to take a job that — where he was going to be a piñata, basically, for all kinds of investigations.

And rightfully, Wells should be checked out on everything they do. All banks should. I mean, they get a government guarantee and they receive trillions of dollars in deposits. And they do that basically because of the FDIC. And if they abuse that, they should pay a price.

If anybody does anything like a Paul Mozier did, for example, with Salomon, they ought to go to jail. Paul Mozier only went to jail for four months. But if you're breaking laws, you should be prosecuted on it.

If you do a lot of dumb things, I wish they wouldn't go away — the CEOs wouldn't go away — so rich under those circumstances. But people will do dumb things. (Applause)

I actually proposed — think it may have been in one of the annual reports even. I proposed that, if a bank gets to where it needs government assistance, that basically the responsible CEO should lose his net worth and his spouse's net worth. If he doesn't want the job under those circumstances, you know (Applause)

And I think that the directors — I think they should come after the directors for the last five years — I think I proposed — of everything they'd received.

But it's the shareholders who pay. I mean, if we own 9 percent of Wells, whatever this has cost, 9 percent of it is being borne by us. And it's very hard to tie it directly.

One thing you should know, incidentally though, is that the FDIC, which was started — I think it was started January 1st, 1934 — but it was a New Deal proposal.

And the FDIC has not cost the United States government a penny. It now has about \$100 billion in it. And that money has all been put in there by the banks. And that's covered all the losses of the hundreds and hundreds and hundreds of financial institutions.

And I think the impression is that the government guarantee saved the banks, but the government money did not save the banks. The banks' money, as an industry, not only has paid every loss, but they've accumulated an extra \$100 billion, and that's the reason the FDIC assessments now are going back down. They had them at a high level. And they had a higher level for the very big banks.

When you hear all the talk about — the political talk — about the banks, they had not cost the federal government a penny. There were a lot of actions that took place that should not have

taken place. And there's a lot fewer now, I think, than there were in the period leading up to 2008 and '09. But some banks will make big mistakes in the future. Charlie?

CHARLIE MUNGER: I've got nothing to add to that.

11. "We will spend a lot of money" on buybacks if price is right

WARREN BUFFETT: OK. Jay Gelb from Barclays. Barclays just had a proxy contest of sorts, didn't it?

JAY GELB (INSURANCE ANALYST, BARCLAYS): That's right, Warren. (Laughs)

I also have a question on Berkshire Hathaway — I'm sorry — on share buybacks.

Warren, in a recent Financial Times article, you were quoted as saying that the time may come when the company buys back as much as \$100 billion of its shares, which equates to around 20 percent of Berkshire's current market cap. How did you arrive at that \$100 billion figure? And over what time frame would you expect this to occur?

WARREN BUFFETT: Yeah. I probably arrived at that \$100 billion figure in about three seconds when I got asked the question. (Laughter)

It was a nice round figure and we could do it. And we would like to do it if the stock was — we've got the money to buy in \$100 billion worth of stock.

And bear in mind, if we're buying in \$100 billion stock, it probably would be that the company wasn't selling at 500 billion. So, it might buy well over 20 percent.

We will spend a lot of money. We've been involved in companies where the number of shares has been reduced 70 or 80 percent over time. And we like the idea of buying shares at a discount.

We do feel, if shareholders — if we're going to be repurchasing shares from shareholders who are partners, and we think it's cheap, we ought to be very sure that they have the facts available to evaluate what they own.

I mean, just as if we had a partnership, it would not be good if there were three partners and two of them decided that they would sort of freeze out the third, maybe in terms of giving him material information that they knew that that third party didn't know.

So, it's very important that our disclosure be the same sort of disclosure that I would give to my sisters who are the imaginary — they're not imaginary — but they're the shareholders to whom I address the annual report every year.

Because I do feel that you, if you're going to sell your stock, should have the same information that's important, that's available to me and to Charlie.

But we will — if our stock gets cheap, relative to intrinsic value, we would not hesitate.

We wouldn't be able to buy that much in a very short period of time, in all likelihood. But we would certainly be willing to spend \$100 billion. Charlie?

CHARLIE MUNGER: I think when it gets really obvious, we'll be very good at it. (Laughter)

WARREN BUFFETT: Let me get that straight. What'd you say, exactly?

CHARLIE MUNGER: When it gets really obvious, we'll be very good at it.

WARREN BUFFETT: Oh, yeah. I was hoping that's what you said. (Laughter)

Yeah, we will be good at it. We don't have any trouble being decisive. We don't say yes very often. But if it's something obvious — I mean, Jay, if you and I are partners, you know, and our business is worth a million dollars and you say you'll sell your half to me for 300,000, you'll have your 300,000 very quickly.

12. Buying one share in an oil-rich duck hunting club

WARREN BUFFETT: OK, station two.

AUDIENCE MEMBER: Good morning. My name is Patrick Donahue from Eden Prairie, Minnesota, and I'm with my ten-year-old daughter, Brooke Donahue.

AUDIENCE MEMBER: Hi, Warren. Hi, Charlie.

WARREN BUFFETT: Hi. It's Brooke, is it?

AUDIENCE MEMBER: It is.

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: First, I'm a proud graduate of Creighton University. And I need to say a personal thank you for coming over the years to share your insights. And it's been a tradition since I graduated in 1999 to come to the annual meeting, and thank you for a lifetime of memories.

WARREN BUFFETT: Thank you. (Applause)

AUDIENCE MEMBER: Brooke is a proud Berkshire shareholder and read the letter and had some questions regarding investments that have been made in the past. And she had made some interesting comments about what she thought was a lot of fun.

So, our question for both of you is: outside of Berkshire Hathaway, what is the most interesting or fun personal investment you have ever made? (Laughter)

WARREN BUFFETT: Well, they're always more fun when you make a lot of money off of them. (Laughter)

Well, one time, I bought one share of stock in the Atled Corp. That's spelled A-T-L-E-D. And Atled had 98 shares outstanding and I bought one. And not what you call a liquid security. (Laughter)

And Atled happened to be the word "delta" spelled backwards. And a hundred guys in St. Louis had each chipped in 50 or \$100 or something to form a duck club in Louisiana and they bought some land down there.

Two guys didn't come up with their — there were a hundred of them — two of them defaulted on their obligation to come up with a hundred dollars — so there were 98 shares out. And they went down to Louisiana and they shot some ducks.

But apparently somebody shot — fired a few shots into the ground and oil spurted out. And — (laughter) — those Delta duck club shares — and I think the Delta duck club field is still producing. I bought stock in it 40 years ago for \$29,200 a share.

And it had that amount in cash and it was producing a lot, and they sold it. If they kept it, that stock might've been worth 2 or \$3 million a share, but they sold out to another oil company.

That was certainly — that was the most interesting —

Actually, I didn't have any cash at the time. And I went down and borrowed the money. I bought it for my wife. And I borrowed the money. And the loan officer said, "Would you like to borrow some money to buy a shotgun as well?" (Laughter)

Charlie, tell them about the one you missed. (Laughter)

CHARLIE MUNGER: Well, I got two investments that come to mind. When I was young and poor, I spent a thousand dollars once buying an oil royalty that paid me 100,000 a year for a great many years. But I only did that once in a lifetime.

On a later occasion, I bought a few shares of Belridge Oil, which went up 30 times rather quickly. But I turned down five times as much as I bought. It was the dumbest decision of my

whole life. So, if any of you have made any dumb decisions, look up here and feel good about yourselves. (Laughter)

WARREN BUFFETT: I could add a few, but — Andrew?

13. Buffett speaks for himself on politics, not for Berkshire

ANDREW ROSS SORKIN (NEW YORK TIMES/CNBC): Warren and Charlie, this is a question — actually, we got a handful of questions on this topic. This is probably the best formulation of it.

Warren, you have been a long-time, outspoken Democrat. With all the talk about socialism versus capitalism taking place among Democratic presidential candidates, do you anticipate an impact on Berkshire in the form of more regulations, higher corporate taxes, or even calls for breakups among the many companies we own if they were to win?

And how do you think about your own politics as a fiduciary of our company, and at the same time, as someone who has said that simply being a business leader doesn't mean you've put your citizenship in a blind trust?

WARREN BUFFETT: Yeah. I have said that you do not put your citizenship in a blind trust. But you also don't speak on behalf of your company. You do speak as a citizen if you speak. And therefore, you have to be careful about when you do speak, because it's going to be assumed you're speaking on behalf of your company.

Berkshire Hathaway certainly, in 54 years, has never — and will never — made a contribution to a presidential candidate. I don't think we've made a contribution to any political candidate. But I don't want to say, for 54 years, that — (Applause)

We don't do it now. We operate in several regulated industries. And our railroad and our utility, as a practical matter, they have to have a presence in Washington or in the state legislatures in which they operate.

So, we have some — a few — I don't know how many — political action committees which existed when we bought it — when we bought the companies at subsidiaries.

And I think, unquestionably, they make some contributions simply to achieve the same access as their competitors. I mean, if the trucking industry is going to lobby, I'm sure the railroad industry's going to lobby.

But — the general — well, the rule is, I mean, that people do not pursue their own political interests with your money here.

We've had one or two managers over the years, for example, that would do some fundraising where they were fundraising from people who were suppliers of them or something of the sort. And if I ever find out about it, that ends promptly.

My position, at Berkshire, is not to be used to further my own political beliefs. But my own political beliefs can be expressed as a person, not as a representative of Berkshire, when a campaign is important.

I try to minimize it. But it's no secret that in the last election, for example, I raised money.

I won't give money to PACs. I accidentally did it one time. I didn't know it was a PAC. But I don't do it.

But I've raised substantial sums. I don't like the way money is used in politics. I've written op-ed pieces for the New York Times in the past on the influence of money in politics.

I spent some time with John McCain many years ago before McCain-Feingold, on ways to try to limit it. But the world has developed in a different way.

14. Buffett: "I'm a card-carrying capitalist" but some regulations are needed

WARREN BUFFETT: On your question about the — I will just say I'm a card-carrying capitalist. (Applause)

But I — and I believe we wouldn't be sitting here except for the market system and the rule of law and some things that are embodied in this country. So, you don't have to worry about me changing in that manner.

But I also think that capitalism does involve regulation. It involves taking care of people who are left behind, particularly when the country gets enormously prosperous. But beyond that, I have no Berkshire podium for pushing anything. Charlie?

CHARLIE MUNGER: Well, I think we're all in favor of some kind of a government social safety net in a country as prosperous as ours.

What a lot of us don't like is the vast stupidity with which parts of that social safety net are managed by the government. It'd be much better if — (applause) — we could do it more wisely. But I think it also might be better if we did it more liberally.

WARREN BUFFETT: Yeah, one of the reasons we're involved in this effort along with J.P. Morgan and Amazon — with (J.P. Morgan CEO) Jamie Dimon and (Amazon CEO) Jeff Bezos — on the medical question, is we do have as much money going — 3.3 or 3.4 trillion — we have as much money going to medical care as we have funding the federal government.

And it's gone from 5 to 17 percent — or 18 percent — while actually the amount going to the federal government has stayed about the same at 17 percent.

So, we hope there's some major improvements from the private sector because I generally think the private sector does a better job than the public sector in most things.

But I also think that if the private sector doesn't do something, you'll get a different sort of answer. And I'd like to think that the private sector can come up with a better answer than the public sector in that respect.

I will probably — it depends who's nominated — but I voted for plenty of Republicans over the years. I even ran for delegate to the Republican National Convention in 1960. But — we are not —

I don't think the country will go into socialism in 2020 or in 2040 or 2060.

15. We don't try to push Berkshire stock higher or lower

WARREN BUFFETT: OK, Gregg Warren.

GREGG WARREN (FINANCIAL SERVICES ANALYST, MORNINGSTAR RESEARCH SERVICES): Warren, my first question, not surprisingly, is on share repurchases.

Stock buybacks in the open market are a function of both willing buyers and sellers. With Berkshire having two shares of classes, you should have more flexibility when buying back stock. But given the liquidity difference that exists between the two share classes — with an average of 313 Class A shares exchanging hands daily the past five years, equivalent to around \$77 million a day, and an average of 3.7 million Class B shares doing the same, equivalent to around 622 million — Berkshire's likely to have more opportunities to buy back Class B shares than Class A, which is exactly what we saw during the back half of last year and the first quarter of 2019.

While it might be more ideal for Berkshire to buy back Class A shares, allowing you to retire shares with far greater voting rights, given that there's relatively little arbitrage between the two share classes and the number of Class B shares increase every year as you gift your Class A shares to the Bill and Melinda Gates Foundation and your children's foundations, can we assume that you're likely to be a far greater repurchaser of Class B shares, going forward, especially given your recent comments to the Financial Times about preferring to have loyal individuals on your shareholder list, which a price tag of \$328,000 of Class A shares seems to engender?

WARREN BUFFETT: Yeah, we will - when we're repurchasing shares, if we're purchasing substantial amounts, we're going to spend a lot more on the Class B than the Class A, just because the trading volume is considerably higher.

We may, from time to time — well, we got offered a couple blocks in history, going back in history from the Yoshi (PH) estate and when we had a transaction exchanging our Washington Post stock for both a television station and shares held — A shares — held by the Washington Post.

So, we may see some blocks of A. We may see some blocks of B. But there's no question. If we are able to spend 25, 50, or a hundred billion dollars in repurchasing shares, more of the money is almost certainly going to be spent on the B than the A.

There's no master plan on that other than to buy aggressively when we like the price. And as I say, the trading volume in the B is just a lot higher than the A in dollar amounts. Charlie?

CHARLIE MUNGER: I don't think we care much which class we buy.

WARREN BUFFETT: Yeah. (Laughter)

We would like — we really want the stock — ideally, if we could do it if we were small — once a year we'd have a price and, you know, we'd do it like a private company. And it would be a fair price and people who want to get out could get out. And if other people wanted to buy their interest, fine. And if they didn't, and we thought the price was fair, we'd have the company repurchase it.

We can't do that. But that's — we don't want the stock to be either significantly underpriced or significantly overpriced. And we're probably unique on the overpriced part of it. But we don't want it.

I do not want the stock selling at twice what's it worth because I'm going to disappoint people, you know. I mean, we can't make it — there's no magic formula to make a stock worth what it's selling for, if it sells for way too much.

From a commercial standpoint, if it's selling very cheap, we have to like it when we repurchase it.

But ideally, we would hope the stock would sell in a range that more or less is its intrinsic business value. We have no desire to hype it in any way. And we have no desire to depress it so we can repurchase it cheap. But the nature of markets is that things get overpriced and they get underpriced. And we will — if it's underpriced, we'll take advantage of it.

16. We welcome change, but we won't always adapt to it

WARREN BUFFETT: OK, station 3.

AUDIENCE MEMBER: Hello Charlie Munger and Warren Buffett, (unintelligible). I am Terry (PH) from Shanghai (unintelligible), which aims to catch the best investment opportunities in that era.

So, my question is, as we all know, 5G is coming. It is said that the mode of all industry will be challenged in 5G era. So, what is the core competence that we should master, if (unintelligible) wants to catch the best investment opportunities in this era? Thank you.

WARREN BUFFETT: Well, there's no core competence at the very top of Berkshire. (Laughter)

The subsidiaries that will be involved in developments relating to 5G, or any one of all kinds of things that are going to happen in this world, you know, the utility of LNG in the railroad, or all those kinds of questions, we have people in those businesses that know a lot more about them than we do.

And we count on our managers to anticipate what is coming in their business. And sometimes they talk to us about it. But we do not run that on a centralized basis.

And Charlie, do you want to have anything to add to that?

Do you know anything about 5G I don't know? Well, you probably know a lot about 5G.

CHARLIE MUNGER: No, I know very little about 5G.

But I do know a little about China. And we have bought things in China. And my guess is we'll buy more. (Laughter)

WARREN BUFFETT: Yeah. But I mean, we basically want to have a group of managers, and we do have a group of managers, who are on top of their businesses.

I mean, you saw something that showed BNSF and Berkshire Hathaway Energy and Lubrizol all aware of that. Those people know their businesses. They know what changes are likely to be had.

Sometimes, they find things that they can cooperate on between their businesses. But we don't try to run those from headquarters.

And that may mean — that may have certain weaknesses at certain times. I think, net, it's been a terrific benefit for Berkshire.

Our managers, to a great degree, own their businesses. And we want them to feel a sense of ownership. We don't want them to be lost in some massive conglomerate, where they get directions from this group, which is a subgroup of that group.

And I could tell you a few horror stories from companies we bought, when they tell us about their experience under such an operation.

The world is going to change in dramatic ways. Just think how much it's changed in the 54 years that we've had Berkshire. And some of those changes hurt us.

They hurt us in textiles. They hurt us in shoes. They hurt us in the department store business. Hurt us in the trading stamp business. These were the founding businesses of this operation. But we do adjust. And we've got a group, overall, of very good businesses.

We've got some that will be, actually, destroyed by what happens in this world. But that's — I still am the card-carrying capitalist. And I believe that that's a good thing, but you have to make changes.

We had 80 percent of the people working on farms in 1800. And if there hadn't been a lot of changes, and you needed 80 percent of the people in the country producing the food and cotton we needed, we would have a whole different society.

So, we welcome change. And we certainly want to have managers that can anticipate and adapt to it. But sometimes, we'll be wrong. And those businesses will wither and die. And we'd better use the money someplace else. Charlie? OK, Carol.

Charlie, you haven't had any peanut brittle lately, you know. (Laughs)

17. Kraft Heinz is a good business, but we paid too much

CAROL LOOMIS: This question comes from Vincent James of Munich, Germany. "There has been a lot written about the recent impairment charge at Kraft Heinz. You were quoted as stating that you recognize that Berkshire overpaid for Kraft Heinz. Clearly, major retail chains are being more aggressive in developing house brands.

"In addition, Amazon has announced intentions to launch grocery outlets, being that, as Mr. Bezos has often stated, 'Your margin is my opportunity.' The more-fundamental question related to Kraft Heinz may be whether the advantages of the large brands and zero-based budgeting that 3G has applied are appropriate and defensible at all in consumer foods.

"In other words, will traditional consumer good brands, in general, and Kraft Heinz, in particular, have any moat in their future? My question is, to what extent do the changing dynamics in the consumer food market change your view on the long-term potential for Kraft Heinz?"

WARREN BUFFETT: Yeah, actually, what I said was, we paid too much for Heinz — I mean Kraft — I'm sorry — the Heinz part of the transaction, when we originally owned about half of Heinz,

we paid an appropriate price there. And we actually did well. We had some preferred redeemed and so on.

We paid too much money for Kraft. To some extent, our own actions had driven up the prices.

Now, Kraft Heinz, the profits of that business, 6 billion — we'll say very, very, very roughly, I'm not making forecasts — but 6 billion pretax on 7 billion of tangible assets, is a wonderful business. But you can pay too much for a wonderful business.

We bought See's Candy. And we made a great purchase, as it turned out. And we could've paid more. But there's some price at which we could've bought even See's Candy, and it wouldn't have worked. So, the business does not know how much you paid for it.

I mean, it's going to earn based on its fundamentals. And we paid too much for the Kraft side of Kraft Heinz.

Additionally, the profitability has basically been improved in those operations over the way they were operating before.

But you're quite correct that Amazon itself has become a brand. Kirkland, at Costco, is a \$39 billion brand. All of Kraft Heinz is \$26 billion. And it's been around for — on the Heinz side — it's been around for 150 years. And it's been advertised — billions and billions and billions of dollars, in terms of their products. And they go through tens of thousands of outlets.

And here's somebody like Costco, establishes a brand called Kirkland. And it's doing 39 billion, more than virtually any food company. And that brand moves from product to product, which is terrific, if a brand travels. I mean, Coca Cola moves it from Coke to Cherry Coke and Coke Zero and so on.

But to have a brand that can really move — and Kirkland does more business than Coca Cola does. And Kirkland operates through 775 or so stores. They call them warehouses at Costco. And Coca Cola is through millions of distribution outlets.

So, brands — the retailer and the brands have always struggled as to who gets the upper hand in moving a product to the consumers.

And there's no question, in my mind, that the position of the retailer, relative to the brands, which varies enormously around the world. In different countries, you've had 35 percent, even, maybe 40 percent, be private-label brands in soft drinks. And it's never gotten anywhere close to that in the United States. So, it varies a lot.

But basically, retailers — certain retailers — the retail system — has gained some power. And particularly in the case of Amazon and Walmart and their reaction to it, and Costco — and Aldi and some others I can name — has gained in power relative to brands.

Kraft Heinz is still doing very well, operationally. But we paid too much. If we paid 50 billion, you know, it would've been a different business. It'd still be earning the same amount.

You can turn any investment into a bad deal by paying too much. What you can't do is turn any investment into a good deal by paying little, which is sort of how I started out in this world.

But the idea of buying the cigar butts that are declining or poor businesses for a bargain price is not something that we try to do anymore. We try to buy good businesses at a decent price. And we made a mistake on the Kraft part of Kraft Heinz. Charlie?

CHARLIE MUNGER: Well, it's not a tragedy that, out of two transactions, one worked wonderfully, and the other didn't work so well. That happens.

WARREN BUFFETT: The reduction of costs, you know — there can always be mistakes made, when you've got places, and you're reorganizing them to do more business with the same number of people.

And we like buying businesses that are efficient to start with. But the management — the operations — of Kraft Heinz have been improved over the present management overall. But we paid a very high price, in terms of the Kraft part. We paid an appropriate price, in terms of Heinz.

18. Internet competition for Berkshire's furniture retailers

WARREN BUFFETT: Jonathan?

JONATHAN BRANDT: Internet-based furniture retailers, like Wayfair, appear willing to stomach large current losses acquiring customers in the hope of converting them to loyal online shoppers.

I've been wondering what this disruptive competition might do to our earnings from home-furnishing retail operations like Nebraska Furniture Mart.

If we have to transition to more of an online model, might we have to spend more heavily to keep shoppers without a corresponding increase in sales? The sharp decline in first-quarter earnings from home furnishings suggest, perhaps, some widening impact from intensifying competition.

Do you believe Wayfair's customers first, profits later model is unsustainable? Or do you think our furniture earnings will likely be permanently lower than they were in the past?

WARREN BUFFETT: I think furnishings — the jury's still out on that, whether the operations which have grown very rapidly in size but still are incurring losses, how they will do over time.

It is true that in the present market, partly because of some successes, like, most dramatically, Amazon, in the past, that investors are willing to look at losses as long as sales are increasing, and hope that there will be better days ahead.

We do a quite significant percentage of our sales online in the furniture operation. That might surprise you. We do the highest percentage in Omaha.

And what's interesting is that we — I won't give you the exact numbers, but it's large — we do a significant dollar volume, but a very significant portion of that volume, people come to the store to pick up, so that they will order something from us online, but they don't seem to mind at all — and they don't have to do it — but they get a pick up at the store.

So, you know, you learn what customers like, just like people learned in fast food, you know, that people would buy a lot of food by going through a drive-in, that they don't want to stop and go into the place. We learn about customer behavior as it unfolds.

But we did do, now — on Tuesday, we did 9.2 million of — or 9.3 million of profitable volume at the Nebraska Furniture Mart. And I think that company had paid-in capital of \$2,500. And I don't think anything's been added since. So, it's working so far.

The first quarter — It's interesting — the first quarter was weak at all four of our furniture operations.

But there are certain other parts of the economy — well, just home building, generally — it's considerably below what you would've expected, considering the recovery we have had from the 2008-9 period. I mean, if you look at single-family home construction, the model has shifted more to people living in apartment rentals.

I think it's gone from 69-and-a-fraction percent. It got down to 63 percent. It's bounced up a little bit. But people are just not building — or moving to houses as rapidly as I would have guessed they would have, based on figures prior to 2008 and '09, and considering the recovery we've had, and considering the fact that money is so cheap. And that has some effect on our furniture stores.

But I think we've got a very good furniture operation, not only with the Nebraska Furniture Mart, but at other furniture operations. And we will see whether the models work over the long run.

But I think, you know, they have a reasonable chance. Some things people — we're learning that people will buy some things that they've always gone to the mall or to a retail outlet to buy, that they will do it online. And others don't work so well. Charlie?

CHARLIE MUNGER: I think that we'll do better than most furniture retailers.

WARREN BUFFETT: I think that's a certainty overall, overall. But we've got some good operations there.

But we don't want to become a showroom for the online operations and have people come and look around the place and then order someplace else. So, we have to have the right prices. And we're good at that at the Furniture Mart.

19. Pension funds should avoid "alternative" investments

WARREN BUFFETT: Station 4.

AUDIENCE MEMBER: Warren and Charlie, my name is Brent Muio. I'm from Winnipeg, Canada.

First, thank you for devoting so much time and energy to education. I'm a better investor because of your efforts. But more important, I'm a better partner, friend, son, brother, and soon-to-be first-time father.

There's nothing more important than these relationships. And my life is better, because you're willing to pass on your experience and wisdom.

My path into finance was unconventional. I worked as an engineer for 12 years, while two years ago, I began a career in finance, working for the Civil Service Superannuation Board, a \$7 billion public pension fund in Winnipeg.

I work on alternative investments, which include infrastructure, private equity, and private credit. I go to work every day knowing that I'm there to benefit the hardworking current and future beneficiaries of the fund.

Like most asset classes, alternative purchase multiples have increased. More of these assets are funded with borrowed money. And the terms and covenants on this debt are essentially nonexistent.

With this in mind and knowing the constraints of illiquid, closed-end funds, please give me your thoughts on private, alternative investments, the relevancy in public pension funds, and your view on long-term return expectations.

WARREN BUFFETT: Yeah, if you leveraged up investments in just common stocks, and you'd figured a way so that you would have staying power, if there were any market dip, I mean, you'd obviously retain extraordinary returns.

I pointed out, in my investing lifetime, you know, if an index fund would do 11 percent, well, imagine how well you would've done if you'd leveraged that up 50 percent whatever the prevailing rates were over time.

So, a leveraged investment in a business is going to beat an unleveraged investment in a good business a good bit of the time. But as you point out, the covenants to protect debtholders have really deteriorated in the business. And of course, you've been in an upmarket for businesses. And you've got a period of low interest rates. So, it's been a very good time for it.

My personal opinion is, if you take unleveraged returns against unleveraged common stocks, I do not think what is being purchased today and marketed today would work well.

But if you can borrow money, if you can buy assets that will yield 7 or 8 percent, you can borrow enough money at 4 percent or 5 percent, and you don't have any covenants to meet, you're going to have some bankruptcies. But you're going to also have better results in many cases.

It's not something that interests us at all. We are not going to leverage up Berkshire. If we'd leveraged up Berkshire, we'd have made a whole lot more money, obviously, over the years.

But both Charlie and I, probably, have seen some more high-IQ people — really extraordinarily high-IQ people — destroyed by leverage. We saw Long-Term Capital Management, where we had people who could do in their sleep math that we couldn't do, at least I couldn't do, you know, working full time at it during the day and, I mean, really, really smart people working with their own money and with years and years of experience of what they were doing.

And you know, it all turned to pumpkins and mice in 1998. And actually, it was a source of national concern, just a few hundred people. And then we saw some of those same people, after that happened to them once, go on and do the same thing again.

So, I would not get excited about so-called alternative investments. You can get all kinds of different figures. But there may be — there's probably at least a trillion dollars committed to buying, in effect, buying businesses. And if you figure they're going to leverage them, you know, two for one on that, you may have 3 trillion of buying power trying to buy businesses in — well, the U.S. market may be something over 30 trillion now — but there's all kinds of businesses that aren't for sale and that thing.

So, the supply-demand situation for buying businesses privately and leveraging them up has changed dramatically from what it was ten or 20 years ago.

And I'm sure it doesn't happen with your Winnipeg operation, but we have seen a number of proposals from private equity funds, where the returns are really not calculated in a manner than — well, they're not calculated in a manner that I would regard as honest.

And so I — it's not something — if I were running a pension fund, I would be very careful about what was being offered to me.

If you have a choice in Wall Street between being a great analyst or being a great salesperson, salesperson is the way to make it.

If you can raise \$10 billion in a fund, and you get a 1 1/2 percent fee, and you lock people up for ten years, you know, you and your children and your grandchildren will never have to do a thing, if you are the dumbest investor in the world. But —

Charlie?

CHARLIE MUNGER: Well, I think what we're doing will work more safely than what he's doing. And — but I wish him well.

WARREN BUFFETT: Yeah, Brent, you sound — actually, you sound like a guy that I would hope would be working for a public pension fund. Because frankly, most of the institutional funds, you know — well, we had this terrible — right here in Omaha — you can get a story of what happened with our Omaha Public Schools' retirement fund. And they were doing fine until the manager started going in a different direction. And the trustees here — perfectly decent people — and the manager had done OK to that point, and —

CHARLIE MUNGER: Yeah, but they are smarter in Winnipeg than they are here.

WARREN BUFFETT: Yeah. Well — (Laughter)

CHARLIE MUNGER: That was pretty bad here.

WARREN BUFFETT: It's not a fair fight, actually, usually, when a bunch of public officials are listening to people who are motivated to really just get paid for raising the money. Everything else is gravy after that.

But if you run a fund, and you get even 1 percent of a billion, you're getting \$10 million a year coming in. And if you've got the money locked up for a long time, it's a very one-sided deal.

And you know, I've told the story of asking the guy one time, in the past, "How in the world can you — why in the world can you ask for 2-and-20 when you really haven't got any kind of evidence that you are going to do better with the money than you do in an index fund?" And he said, "Well, that's because I can't get 3-and-30," you know. (Laughter)

CHARLIE MUNGER: What I don't like about a lot of the pension fund investments is I think they like it because they don't have to mark it down as much as it should be in the middle of the panics. I think that's a silly reason to buy something. Because you're given leniency in marking it down.

WARREN BUFFETT: Yeah. And when you commit the money — in the case of private equity often — you — they don't take the money, but you pay a fee on the money that you've committed.

And of course, you really have to have that money to come up with at any time. And of course, it makes their return look better, if you sit there for a long time in Treasury bills, which you have to hold, because they can call you up and demand the money, and they don't count that.

They count it in terms of getting a fee on it. But they don't count it in terms of what the so-called internal rate of return is. It's not as good as it looks. And I really do think that when you have a group sitting as a state pension fund —

CHARLIE MUNGER: Warren, all they're doing is lying a little bit to make the money come in.

WARREN BUFFETT: Yeah. Yeah, well, that sums it up. (Laughter)

20. Amazon buy doesn't mean portfolio managers aren't "value" investors

WARREN BUFFETT: Becky?

BECKY QUICK: This question is from Ken Skarbeck in Indianapolis. He says, "With the full understanding that Warren had no input on the Amazon purchase, and that, relative to Berkshire, it's likely a small stake, the investment still caught me off guard.

"I'm wondering if I should begin to think differently about Berkshire looking out, say, 20 years. Might we be seeing a shift in investment philosophy away from value-investing principles that the current management has practiced for 70 years?"

"Amazon is a great company. Yet, it would seem its heady shares ten years into a bull market appear to conflict with being fearful when others are greedy. Considering this and other recent investments, like StoneCo, should we be preparing for change in the price-versus-value decisions that built Berkshire?"

WARREN BUFFETT: Yeah. It's interesting that the term "value investing" came up. Because I can assure you that both managers who — and one of them bought some Amazon stock in the last quarter, which will get reported in another week or ten days — he is a value investor.

The idea that value is somehow connected to book value or low price/earnings ratios or anything — as Charlie has said, all investing is value investing. I mean, you're putting out some money now to get more later on. And you're making a calculation as to the probabilities of getting that money and when you'll get it and what interest rates will be in between.

And all the same calculation goes into it, whether you're buying some bank at 70 percent of book value, or you're buying Amazon at some very high multiple of reported earnings.

Amazon — the people making the decision on Amazon are absolutely as much value investors as I was when I was looking around for all these things selling below working capital, years ago. So, that has not changed.

The two people — one of whom made the investment in Amazon — they are looking at many hundreds of securities. And they can look at more than I can, because they're managing less money. And their universe — possible universes — is greater.

But they are looking for things that they feel they understand what will be developed by that business between now and Judgement Day, in cash.

And it's not — current sales can make some difference. Current profit margins can make some difference. Tangible assets, excess cash, excess debt, all of those things go into making a calculation as to whether they should buy A versus B versus C.

And they are absolutely following value principles. They don't necessarily agree with each other or agree with me. But they are very smart. They are totally committed to Berkshire. And they're very good human beings, on top of it.

So, I don't second guess them on anything. Charlie doesn't second guess me. In 60 years, he's never second guessed me on an investment.

And the considerations are identical when you buy Amazon versus some, say, bank stock that looks cheap, statistically, against book value or earnings or something of the sort.

In the end, it all goes back to Aesop, who, in 600 B.C., said, you know, that a bird in the hand is worth two in the bush.

And when we buy Amazon, we try and figure out whether the — the fellow that bought it — tries to figure out whether there's three or four or five in the bush and how long it'll take to get to the bush, how certain he is that he's going to get to the bush, you know, and then who else is going to come and try and take the bush away and all of that sort of thing. And we do the same thing.

And it really, despite a lot of equations you learn in business school, the basic equation is that of Aesop. And your success in investing depends on how well you were able to figure out how certain that bush is, how far away it is, and what the worst case is, instead of two birds being there, and only one being there, and the possibilities of four or five or ten or 20 being there.

And that will guide me. That will guide my successors in investment management at Berkshire. And I think they'll be right more often than they're wrong. Charlie?

CHARLIE MUNGER: Well I — Warren and I are a little older than some people, and —

WARREN BUFFETT: Damn near everybody. (Laughs)

CHARLIE MUNGER: And we're not the most flexible, probably, in the whole world. And of course, if something as extreme as this internet development happens, and you don't catch it, why, other people are going to blow by you.

And I don't mind not having caught Amazon early. The guy is kind of a miracle worker. It's very peculiar. I give myself a pass on that.

But I feel like a horse's ass for not identifying Google better. I think Warren feels the same way.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: We screwed up.

WARREN BUFFETT: He's saying we blew it. (Laughter)

And we did have some insights into that, because we were using them at GEICO, and we were seeing the results produced. And we saw that we were paying \$10 a click, or whatever it might've been, for something that had a marginal cost to them of exactly zero. And we saw it was working for us. So —

CHARLIE MUNGER: We could see in our own operations how well that Google advertising was working. And we just sat there sucking our thumbs. (Laughter)

So, we're ashamed. We're trying to atone. (Laughter)

Maybe Apple was atonement. (Laughter)

WARREN BUFFETT: When he says, "Sucking our thumbs," I'm just glad he didn't use some other example. (Laughter)

21. Buffett: Berkshire insurance businesses are worth more than you think

WARREN BUFFETT: OK, Jay?

JAY GELB: This question is on Berkshire's intrinsic value. Warren, in your most-recent annual letter, you discussed a methodology to estimate Berkshire's intrinsic value. However, a major component of Berkshire's value that many investors find challenging to estimate is that of the company's vast and unique insurance business.

Could you discuss how you value the company's insurance unit, based on information Berkshire provides, especially since GAAP book value is not disclosed, of the insurance unit?

WARREN BUFFETT: Well, our insurance business gives us a float that's other people's money, which we're temporarily holding, but which gets regenerated all the time, so as a practical matter, it has a very, very long life. And it's probably a little more likely to grow than shrink.

So, we have \$124 billion that people have given us. And that's somewhat like having a bank that just consists of one guy. And people come in and deposit \$124 billion and promise not to withdraw it forever.

And we've got a very good insurance business. It's taken a very long time to develop it, very long time. In fact, I think we probably have the best property-casualty operation, all things considered, in the world, that I know of, of any size. So, it's worth a lot of money.

It's probably — we think it's worth more to us, and we particularly think it's worth more while lodged inside Berkshire. We'd have a very, very high value on that. I don't want to give you an exact number, because I don't know the exact number. And any number I would have given you in the past would've turned out to be wrong, on the low side.

We have managed to earn money on money that was given to us for nothing and have (inaudible) earnings from underwriting and then have these large earnings from investing. And it's an integral part of Berkshire.

There's a certain irony to insurance that most people don't think about. But if you really are prepared, and you have a diversified property-casualty insurance business — a lot of property business in it — if you're really prepared to pay your claims under any circumstances that come along in the next hundred years, you have to have so much capital in the business that it's not a very good business.

And if you really think about a worst-case situation, the reinsurance — that's insurance you buy from other people, as an insurance company, to protect you against the extreme losses, among other things — that reinsurance probably — could likely be — not good at all.

So, even though you'd think you're laying off part of the risk, if you really take the worst-case examples, you may well not be laying off the risk. And if you keep the capital required to protect against that worst-case example, you'll have so much capital in the business that it isn't worthwhile.

Berkshire is really the ideal form for writing the business. Because we have this massive amount of assets that, in many cases, are largely uncorrelated with natural disasters. And we can — we don't need to buy reinsurance from anybody else. And we can use the money in a more efficient way than most insurance companies.

It's interesting. The three — In the last 30 years, the three largest reinsurance companies — and I'm counting Lloyd's as one company — although it isn't — it's a group of brokers assembled in — underwriters assembled at a given location. But people think of Lloyd's as a

massive reinsurance market, which it is, not technically one entity. But if you take the three largest companies — and they're all in fine shape now, they're first-class operations — but all three of them came close to extinction sometime in the last 30 years, or reasonably close.

And we didn't really have any truly extraordinary natural catastrophes. The worst we had was Katrina in, whatever it was, 2006 or thereabouts, 2005. But we didn't have any worst-case situation. And all three of those companies, which everybody looks at as totally good on the asset side, if you show a recoverable from them, two of the three actually made some deals with us to help them in some way. And they're all in fine shape now.

But it's really not a good business if you keep your — as a standalone insurer — if you keep enough capital to really be sure you can pay anything that comes along, under any kind of conditions.

And Berkshire can do that. And it can use the money in ways that it likes to use.

So, it's a very valuable asset. I don't want to give you a figure on it. But we would not sell it. We certainly wouldn't want to sell it for its float value. And that float is shown on the balance sheet as a liability. So, it's extraordinary.

And it's taken a long time to build. It'd be very, very, very hard for anybody to — I don't think they could build anything like it. It just takes so long.

And we continue to plow new ground. If you went in the next room, you would've seen something called "THREE," which is our movement toward small and medium business owners for commercial insurance. And there's an online operation.

And it will take all kind — we'll do all kinds of mid-course adjusting and that sort of thing — and we've only just started up in four states.

But we'll, you know — ten or 20 years from now, that will be a significant asset of Berkshire, just like Geico has grown from two and a fraction billion of premium to, you know, who knows, but well into the mid-30 billion, just with Tony Nicely. And when I said, in the annual report, that Tony Nicely, who's here today —

CHARLIE MUNGER: Warren, is there anybody in the world who has a big casualty insurance business that you'd trade our business for theirs?

WARREN BUFFETT: Yeah, oh, no, it's taken a long time. And it's taken some tremendous people. And Tony Nicely has created more than 50 billion — with his associates, and he's got 39,000 of them, probably more now, because he's growing this year — he's created more than \$50 billion at GEICO — of value — for Berkshire. (Applause)

CHARLIE MUNGER: It's pretty much what you'd expect. It's such an easy business, taking in money now in cash and just keeping the books and giving a little of it back.

There's a lot of stupidity that gets into it. And if you're not way better than average at it, you're going to lose money in the end. It's a mediocre business for most people. And it's good at Berkshire only because we're a lot better at it. And if we ever stop being a lot better at it, it wouldn't be safe for us, either.

WARREN BUFFETT: And Ajit Jain has done a similar thing. He's done it in a variety of ways within the insurance business. But I would not want to undo — somebody would have to give me more than \$50 billion to undo everything he has produced for Berkshire.

And he walked into my office on a Saturday in the mid-1980s. He'd never been in the insurance business before. And I don't think there's anybody in the insurance world that doesn't wish that he'd walked into their office instead of ours, at Berkshire. It's been extraordinary. It's truly been extraordinary.

But we have Tom Nerney. We have Tim Kenesey at MedPro. We have Tom Nerney at U.S. Liability.

We have — at GUARD Insurance — we only bought that a few years ago, and that's a terrific operation. It's based in Wilkes-Barre, Pennsylvania. Who would expect to find a great insurance operation in Wilkes-Barre?

But we've got a great insurance — really great — insurance operation right here in Omaha, about two miles from here. And it was bought by us in 1967. And you know, it changed Berkshire. We built on that base.

We've got a — we really got a great insurance business. And I won't give you a number, but it's probably a bigger number than you've got in your head for — and it's worth more within Berkshire than it would be worth as an independent operation.

Somebody can say, "Well, this little gem, if it was put out there, would sell at a higher multiple," or something of the sort. It works much better as being part of a whole, where we have had two tiny operations — two tiny insurance operations — many, many years ago. And they both went broke. The underwriting was bad. But we paid all the claims. We did not walk away. We paid every dime of claims.

And nobody worries about doing any kind of financial transaction with Berkshire. And you know that today — on Saturday — about 9 in the morning, I got a phone call. And we made a deal the next day committing Berkshire to pay out \$10 billion, come hell or high water, no outs for, you know, material adverse change or anything like that. And people know we'll be there with \$10 billion.

And they know, in the insurance business, when we write a policy that may come — be payable during the worst catastrophe in history, or may be payable 50 years from now, they know Berkshire will pay. And that's why we've got \$124 billion of float.

22. "Don't go overboard on delayed gratification"

WARREN BUFFETT: OK, station 5.

AUDIENCE MEMBER: Hey, Warren and Charlie. I'm Neil Nerrono (PH). I'm 13 years old and from San Francisco.

I feel like I see you in our living room a lot. My dad is constantly playing these videos of you at these meetings. And he teaches me a lot of lessons about you guys. But many of them require the delayed gratification skill. (Laughter)

I want to know, is there any way that kids can develop the delayed gratification skill? (Laughter and applause)

CHARLIE MUNGER: I'll take it, if you want me to, Warren.

WARREN BUFFETT: Go to it.

CHARLIE MUNGER: I'll take that, because I'm a specialist in delayed gratification. I've had a lot of time to delay it. (Laughter)

And my answer is that they sort of come out of the womb with the delayed gratification thing, or they come out of the womb where they have to have everything right now. And I've never been able to change them at all. So, we identify it. We don't train it in.

WARREN BUFFETT: Charlie's had eight children, so he's become more and more of a believer in nature versus nurture. (Laughter)

CHARLIE MUNGER: You'll probably see some nice, old woman of about 95 out there, in threadbare clothing. And she's delaying gratification right to the end and probably has 4,000 A shares. (Laughter)

It's just these second- and third-generation types that are buying all the jewelry.

WARREN BUFFETT: It's interesting. If you think about — we'll take it to a broader point. But if you think of a 30-year government bond paying 3 percent, and you allow for, as an individual, paying some taxes on the 3 percent you'll receive, and you'll have the Federal Reserve Board saying that their objective is to have 2 percent inflation, you'll really see that delayed gratification, if you own a long government bond, is that, you know, you get to go to Disneyland and ride the same number of rides 30 years from now that you would if you did it now.

The low interest rates, for people who invest in fixed-dollar investments, really mean that you really aren't going to eat steak later on if you eat hamburgers now, which is what I used to preach to my wife and children and anybody else that would listen, many years ago. (Laughs)

So, it's — I don't necessarily think that, for all families, in all circumstances, that saving money is necessarily the best thing to do in life. I mean, you know, if you really tell your kids they can — whatever it may be — they never go to the movies, or we'll never go to Disneyland or something of the sort, because if I save this money, 30 years from now, you know, well, we'll be able to stay a week instead of two days.

I think there's a lot to be said for doing things that bring you and your family enjoyment, rather than trying to save every dime.

So, I — delayed gratification is not necessarily an unqualified course of action under all circumstances. I always believed in spending two or three cents out of every dollar I earn and saving the rest. (Laughter)

But I've always had everything I wanted. I mean, one thing you should understand, if you aren't happy having \$50,000 or a hundred-thousand dollars, you're not going to be happy if you have 50 million or a hundred million.

I mean, a certain amount of money does make you feel — and those around you — feel better, just in terms of being more secure, in some cases.

But loads and loads of money — I probably know as many rich people as just about anybody. And I do not — I don't think they're happier because they get super rich. I think they are happier when they don't have to worry about money.

But you don't see a correlation between happiness and money, beyond a certain place. So, don't go overboard on delayed gratification. (Applause)

23. Munger on succession: "You're just going to have to endure us"

WARREN BUFFETT: Andrew?

ANDREW ROSS SORKIN: This question comes from a shareholder of yours for more than 20 years, who asked to remain anonymous, but wanted me to start by saying, "Warren and Charlie, I want to preface this question by saying it comes from a place of love for both of you and the beautiful painting you've drawn for us in the form of Berkshire."

WARREN BUFFETT: But. (Laughter)

ANDREW ROSS SORKIN: "Now, please update us on succession planning. And as you think about succession, would you ever consider having Greg (Abel) and Ajit (Jain) join you onstage at future

annual meetings and allow us to ask questions of them and Ted and Todd, as well, so we can get a better sense of their thinking?”

WARREN BUFFETT: That’s probably a pretty good idea. And we’ve talked about it. (Applause)

We have Greg and Ajit here. And any questions that anybody wants to direct to them, it’s very easy to move them over.

So, we thought about having four of us up here. And this format is not set in stone at all.

Because you — I can tell you that, actually, the truth is, Charlie and I are afraid of looking bad. Those guys are better than we are. (Laughs)

You could not have two better operating managers than Greg and Ajit. I mean, they are — it is just fantastic, what they accomplished.

They know the businesses better. They work harder, by far. And you are absolutely invited to ask questions to be directed over to them at this meeting. I don’t think —

Yeah, this format will not be around forever. And if it’s better to get them up on the stage, we’ll be happy to do it.

Ted (Weschler) and Todd (Combs), they’re basically not going to answer investment questions. We regard investment decisions as proprietary, basically. They belong to Berkshire. And we are not an investment advisory organization. So, that is counter to the interests of Berkshire for them to be talking about securities they own. It’s counter to the interests of Berkshire for Charlie or me to be doing it.

We’ve done better because we don’t publish every day what we’re buying and selling. I mean, if somebody’s working on a new product at Apple, or somebody’s working on a new drug or they’re assembling property or something of the sort, they do not go out and tell everybody in the world exactly what they’re doing every day.

And we’re trying to generate ideas in investment. And we do not believe in telling the world what we’re doing every day, except to the extent that we’re legally required. But it’s a good idea. Charlie?

CHARLIE MUNGER: Well, one of the reasons we have trouble with these questions is because Berkshire is so very peculiar. There’s only one thing like it.

We have a different kind of unbureaucratic way of making decisions. There aren’t any people in headquarters. We don’t have endless committees deliberating forever and making bad decisions. We just — we’re radically different. And it’s awkward being so different. But I don’t

want to be like everybody else, because this has worked better. So, I think you're just going to have to endure us. (Laughter and applause)

WARREN BUFFETT: We do think that it's a huge corporate asset, which may only surface very occasionally and depending very much on how the world is around us. But to be the one place, I think, in the world, almost, where somebody can call on a Saturday morning and meet on Sunday morning and have a \$10 billion commitment.

And nobody in the world doubts whether that commitment will be upheld. And it's not subject to any kind of welching on the part of the company that's doing it. It's got nothing involved over than Berkshire's word. And that's an asset that, every now and then, will be worth a lot of money to Berkshire. And I don't really think it will be subject to competition.

So — and Ted and Todd, in particular, are an additional pipeline, and have proven to be an additional pipeline, in terms of facilitating the exercise of that ability. I mean they — things come in through them that, for one reason or another, I might not hear about otherwise.

So, they have expanded our universe. In the markets we've had in recent years, that hasn't been important. I can see periods where they would be enormously valuable. Just take the question that was raised by the fellow from Winnipeg about weak covenants and bonds.

I mean, we could have a situation — who knows when, who knows where, or who knows whether — but we could have a situation where there could be massive defaults in the junk-bond-type market. We've had those a couple times. And we made a fair amount of money off of them.

But Ted and Todd would multiply our effectiveness in a big way, if such a period comes along, or some other types of periods come along. They are very, very, very useful to Berkshire.

The call happened to come in on Friday from Brian Moynihan, CEO of Bank of America. And he's done an incredible job. But we have a better chance of getting more calls and having them properly filtered and everything — appropriately filtered — the next time conditions get chaotic than we did last time. And that's important.

Charlie?

CHARLIE MUNGER: Well, I do think it's true that if the world goes to hell in a hand basket, that you people will be in the right company. We've got a lot of cash and we know how to behave well in a panic. And if the world doesn't go to hell, are things so bad now?

24. Munger invited to happy hour by the bitcoin people

CHARLIE MUNGER: And I also want to report that your vice chairman is getting new social distinction.

I've been invited during this gathering to go to a happy hour put on by the bitcoin people. (Laughter)

And I've tried to figure out what the bitcoin people do in their happy hour, and I finally figured it out. They celebrate the life and work of Judas Iscariot. (Laughter)

CHARLIE MUNGER: Is your invitation still good? (Laughter)

WARREN BUFFETT: Bitcoin — actually — on my honeymoon in 1952, my bride, 19, and I, 21 — stopped in Las Vegas. We just got in — my aunt Alice gave me the car and said, "Have a good time," and we went west.

So, we stopped in the Flamingo, and I looked around, and I saw all of these well-dressed — they dressed better in those days — well-dressed people who had come, in some cases, from thousands of miles away. And this was before jets, so transportation wasn't as good.

And they came to do something that every damn one of them knew was mathematically dumb. And I told Susie, I said, "We are going to make a lot of money." (Laughter)

I mean, imagine people going to stick money on some roulette number with a zero and a double-zero there and knowing the percent. They all could do it, and they — they just do it. And I have to say, bitcoin has rejuvenated that feeling in me. (Laughter)

25. Berkshire will probably increase stakes above 10% if regulations are eased

WARREN BUFFETT: OK, Gregg?

GREGG WARREN: Warren and Charlie. While I understand Berkshire's need to trim its stake in Wells Fargo and any other banks you hold, each year, in order to bring Berkshire's ownership stake below the 10 percent threshold required by the Federal Reserve for bank holdings, given the ongoing share repurchase activity that's taking place in the industry.

I was kind of surprised, though, to see you move to trim all of your holdings, where possible, on a regular basis to eliminate the regulatory requirements that come with ownership levels above 10 percent, which in my view limits the investment universe that Berkshire, or at least Warren, can meaningfully invest in longer term, given that Warren manages a large chunk of Berkshire's \$200 billion equity portfolio.

Could you elaborate more on the regulatory impact for Berkshire of holding more than 10 percent of any company's stock, as well as how you feel about the Fed's recent proposal to allow investors like Berkshire to own up to 25 percent shares of a bank without triggering more restrictive rules and oversight?

Basically, if that proposal were to come to fruition, would you be willing to forego that 10 percent threshold self-imposed that you've done, and put money to work in names that you're already fairly comfortable with?

WARREN BUFFETT: Yeah, the 10 percent, there's a couple reasons —

CHARLIE MUNGER: That's the right answer. Yeah. (Laughter)

WARREN BUFFETT: We will — there's two factors beyond in the case of banks. There's the Federal Reserve requirement there. But many people probably don't even — might not know about this, but if you own over 10 percent of a security — common stock — and you sell it within six months at a profit, you give the money over to the company, the short-swing profit that you give them.

And you match your — any sale against your lowest purchase. And I think if you sell it and then buy it within six months — I'm not as positive about that, because I haven't reread the rule for a lot of years. But I think if you sell and then buy within six months, and the purchase is below the price at which you made the sale, you owe the money to the company.

There used to be lawyers that would scan that monthly SEC report that I used to get 30 or 40 years ago. They would scan it to find people that inadvertently had broken that rule, and they would get paid a fee for recovering it for the company.

So, it restricts enormous — it restricts significantly your ability to reverse a position or change your mind or something of the sort.

Secondly, I think you have to report within two or three business days every purchase you make once you're in that over 10 percent factor. So, you're advertising to the world, but the world tends to follow us some, so it really — it has a huge execution cost attached to it.

Nevertheless — and those are both significant minuses, and they're both things that people generally don't think about.

We did go over recently, for example, in Delta Airlines, that was actually an accident, but I don't mind the fact at all that we did.

And if the Federal Reserve changes its approach, we won't have to trim down below that. We don't want to become a bank holding company and we don't want to —

We went in many years ago and got permission with Wells, but then our permission expired, and we went in again a few — a couple years ago. And we spent a year or so, and there were just a million questions that Wells got asked about us and so on.

So, it's been a deterrent. It'll be less of a deterrent in the future, but it does have those two —

The short-swing thing is less onerous to us than it would be to most people who buy and sell stocks, because we don't really think in terms of doing much.

CHARLIE MUNGER: But if we didn't have all these damn rules, we would cheerfully buy more, wouldn't we?

WARREN BUFFETT: Sure, sure. Well, any time we buy we do it cheerfully, but —

Yeah. And we will — you'll probably see us at more than 10 percent in more things. And if the Fed should change its rules, there will be companies where we drift up over 10 percent simply because they're repurchasing their shares. That's been the case with Wells, and it's been the case with an airline or two in the last year or so.

So, if we like 9.5 percent of a company, we'd like 15 percent better, and you may see us behave a little differently on that in the future.

CHARLIE MUNGER: Well, one more awkward disadvantage of being extremely rich.

WARREN BUFFETT: Yeah. (Laughter)

And it really is. Yeah, and people following you. I mean, the followers problem can be a real problem.

26. Money managers need to set expectations for their investors

WARREN BUFFETT: OK, station 6.

AUDIENCE MEMBER: Hi. I'm Jeff Malloy (PH) from San Francisco. And this is my first shareholders meeting.

Mr. Buffett and Mr. Munger, I'm 27 years old and aspire to be a great money manager like you two one day.

I'm considering starting my own investment fund, but I also recognize that I am young and have a lot to learn. My question to both of you is, how did you know you were ready to manage other people's money? And what general advice would you give to someone in my shoes? Thank you.

WARREN BUFFETT: Well, that's a very interesting question, because I've faced that. And I sold securities for a while, but in May of 1956, I had a number of members of my family — I'd come back from New York, and they wanted me to help them out with stocks as I had earlier before I'd taken a job in New York. And I said, I did not want to get in the stock sales business, but I wanted to — I enjoyed investing. I was glad to figure out a way to do it, which I did through a partnership form.

But I would not have done that, if I thought there was any chance, really, that I would lose the money.

And what I was worried about was not how I would behave, but how they would behave, because I needed people who were in sync with me. So, when we sat down for dinner in May of 1956 with seven people who either were related to me, or one was a roommate in college and his mother.

And I showed them the partnership agreement, and I said, “You don’t need to read this.” You know, there’s no way that I’m doing anything in the agreement that is any way that — you know, you don’t need a lawyer to read it or anything of the sort.

But I said, “Here are the ground rules as to what I think I can do and how I want to be judged, and if you’re in sync with me, I want to manage your money, because I won’t worry about the fact that you will panic if the market goes down or somebody tells you to do something different. So, we have to be on the same page.”

“And if we’re on the same page, then I’m not worried about managing your money. And if we aren’t on the same page, I don’t want to manage your money, because you may be disappointed when I think that things are even better to be investing and so on.”

So, I don’t you want to manage other people’s money until you have a vehicle and can reach the kind of people that will be in sync with you. I think you ought to have your own ground rules as to what your expectations are, when they should you roses and when they should throw bricks at you.

And you want to be on the same — and that’s one reason I never — we didn’t have a single institution in the partnership, because institutions meant committees, and committees meant that —

CHARLIE MUNGER: You had some aunts that trusted you.

WARREN BUFFETT: What’s that?

CHARLIE MUNGER: You had some aunts who trusted you.

WARREN BUFFETT: Yeah, well, and a father-in-law who gave me everything he had in the world, you know. And I didn’t mind taking everything he had in the world, as long as he would stick with me and wouldn’t get panicked by headlines and that sort of thing.

And so, it’s enormously important that you don’t take people that have expectations of you that you can’t meet. And that means you turn down a lot of people. It means you probably start very small, and you get an audited record.

And when you've got the confidence, where if your own parents came to you and they were going to give you all their money, and you were going to invest for them, I think that's the kind of confidence that you'll say, "I may not get the best record, but I'll be sure that you get a decent record over time," that's when you're ready to go on the —

CHARLIE MUNGER: Let me tell you story that I tell young lawyers who frequently come to me and say, "How can I quit practicing law and become a billionaire instead?" (Laughter)

So, I say, well, it reminds me of a story they tell about Mozart. A young man came to him, and he said, "I want to compose symphonies. I want to talk to you about that."

And Mozart said, "How old are you?" And the man said, "Twenty-two." And Mozart said, "You're too young to do symphonies." And the guy says, "But you were writing symphonies when you were ten years old." He says, "Yes, but I wasn't running around asking other people how to do it." (Laughter)

WARREN BUFFETT: Carol?

We wish you well. (Laughter)

And we, and actually, we really do, because the fact you asked that sort of a question is to some extent indicative of the fact you got the right attitude going in.

CHARLIE MUNGER: It isn't that easy to be a great investor. I don't think we'd have made it.

27. Berkshire doesn't have to disclose most foreign stock holdings, so it doesn't

CAROL LOOMIS: This question is from Franz Traumburger (PH) of Austria and his son, Leon, who are both Berkshire shareholders. And it's interesting to me that in the years we've been doing this, nobody has ever asked this question, as far as I know.

Their question is, "Mr. Buffett, I believe it is correct that in its SEC filings — that is the Securities and Exchange Commission — Berkshire does not have to give information about foreign stocks it holds.

"Assuming we hold foreign stocks, could you please tell us what our five largest positions are?"

WARREN BUFFETT: No, the fellow wants investment information. We really aren't in the investment information business. We disclose what we have to disclose, but we could set up an investment advisory firm and probably take in a lot of money, but we haven't done it. And we aren't giving away what belongs to our shareholders for nothing.

But he's correct that — I'm 99 percent sure he's correct, and Marc Hamburg can correct me from our office — but we do not have to report foreign stocks.

And we do have — in certain important countries, there's lower thresholds at which we have to report our holdings, as a percentage of the company stock outstanding — there's lower thresholds than there are in the United States.

So, in a sense — in certain stocks. I think when we bought Munich Re stock or bought Tesco stock, or there are certain stocks we've had to report at — before we would have had to report in the United States.

But we will never unnecessarily advise if we plan to buy some land some place, if we plan to develop a business — we are not about giving business information that's proprietary to Berkshire. We don't give it unless we're required by law.

And he is correct that, I'm virtually certain that we do not have to report our foreign stocks on the SEC filings. And he'll have to find his own holdings in Austria.

But I think this Mozart story may have encouraged that particular question from Austria, what stocks we're going to own in Austria. OK, Charlie, do you have any comments on that?

CHARLIE MUNGER: No.

WARREN BUFFETT: No, I didn't think you would. (Laughs)

28. Buffett expects Precision Castparts earnings will “improve fairly significantly”

WARREN BUFFETT: Jonny?

JONATHAN BRANDT: Precision Castparts' pre-tax profit margins, while perfectly fine relative to American industry as a whole, continue to be almost 10 percentage points below where they were in the years preceding the acquisition. And I'm guessing they're lower than contemplated when the purchase price was determined.

The annual report hints that unplanned shutdowns, the learning curve on new plane models, and a shift of oil and gas capacity to aerospace, might all be temporarily depressing margins. But it's unclear what a reasonable, long-term margin expectation is for this unit.

Now, I know you won't want to issue a specific margin target or forecast, but I do have a question that I hope you can answer.

Is the downward trend in earning since 2015 mostly due to these transitory items, or have the competitive structure of the industry and Precision's relationship with its customers changed to the point that meaningful increases from current margin levels are probably unlikely?

WARREN BUFFETT: Yeah. Your prelude is quite correct. I mean, they are below what we projected a few years ago. And my expectation — but I would have told you this a year ago — and they have improved somewhat.

My expectation is, based on the contracts we have and the fact that the initial years in anything in the aircraft industry, for example, tend to be less profitable as you go further down the learning curve and the volume curve, tend to be lower in the near-term. My expectation is that the earnings of Precision will improve fairly significantly.

And I think I mentioned maybe to you last year, in those earnings, there is about \$400 million a year of purchase amortization, which are economic earnings in my viewpoint.

So — but even including that 400 million a year, which they would be reporting if they were independent, and we don't report, because we bought them and there's a purchase amortization charge. Even without that, they are below what I would anticipate by a fair margin within a year or two. That's the present expectation on my part. Charlie?

CHARLIE MUNGER: No, I don't have anything.

WARREN BUFFETT: You'll have that question for me next year, and I think I'll be giving you a different answer.

29. The older you get, the better you understand human behavior

WARREN BUFFETT: OK, station 7.

AUDIENCE MEMBER: Good morning Mr. Buffett, Mr. Munger. My name is JC. (PH) I am 11 years old, and I came from China. This is my second year at the meeting.

Mr. Munger, it's great to see you again after the Daily Journal meeting in February.

Mr. Buffett, you mentioned that the older you get, the more you understood about human nature. Could you elaborate more about what you've learned, and how can the differences of human nature help you make a better investment? I would also like Mr. Munger to comment on that, please. Thank you very much. (Applause)

WARREN BUFFETT: You should wait for Charlie's answer, because he's even older. (Laughter)

He can tell you more about being old than I can even.

It's absolutely true that virtually any yardstick you use, I'm going downhill. And, you know, if I would take an SAT test now, and you could compare it to a score of what I was in my early 20s, I think it'd be quite embarrassing. (Laughs)

And Charlie and I can give you a lot of examples, and there's others we won't tell you about how things decline as you get older.

But I would say this. It's absolutely true in my view that you can and should understand human behavior better as you do get older. You just have more experience with it. And I don't think you can read — Charlie and I read every book we could on every subject we were interested in, you know, when we were very young. And we learned an enormous amount just from studying the lives of other people.

And — but I don't think you can get to be an expert on human behavior at all by reading books, no matter what your I.Q. is, no matter who the teacher is. And I think that you really do learn a lot about human behavior. Sometimes you have to learn it by having multiple experiences.

I actually think I, despite all the other shortcomings — and I can't do mental arithmetic as fast as I used to, and I can't read as fast as I used to.

But I do think that I know a lot more about human behavior than I did when I was 25 or 30 —

CHARLIE MUNGER: I'll give you — do you want one mantra? It comes from a Chinese gentleman who just died, Lee Kuan Yew, who was the greatest nation builder probably that ever lived in the history of the world.

And he said one thing over and over and over again all his life. "Figure out what works, and do it." If you just go at life with that simple philosophy from your own national group, you will find it works wonderfully well. Figure out what works, and do it.

WARREN BUFFETT: And figuring out what works means figuring out how other people —

CHARLIE MUNGER: Of course.

WARREN BUFFETT: — behave.

CHARLIE MUNGER: Of course.

WARREN BUFFETT: And Charlie and I have seen the extremes in human behavior, in so many unexpected ways.

CHARLIE MUNGER: Now we get it every night, extremes in human behavior. All you got to do is turn on the television.

WARREN BUFFETT: Yeah. I'm glad he used that example. (Laughter)

30. Ajit Jain on pricing unconventional insurance contracts

WARREN BUFFETT: OK, Becky?

BECKY QUICK: Warren, you mentioned, in response to an earlier question, that Ajit (Jain) and Greg (Abel) are both here to answer questions, and so I thought I'd ask this question that comes from Will in Seattle. He says, his question is for Mr. Ajit Jain and Mr. Warren Buffett.

"You have said that you communicate regularly about unconventional insurance contracts that expose the company to extremely unlikely but highly costly events. I'm curious about how you think about and safely price these unconventional insurance contracts. What analyses and mental checks do you run through your head, to make sure that Berkshire Hathaway will profit without being unduly exposed to catastrophic risk?

"Furthermore, Mr. Buffett, would you want a future CEO to continue a similarly close collaboration with the chief underwriter?"

WARREN BUFFETT: We will get a microphone to Ajit and a spotlight in just a second. And there he is.

Ajit, why don't you answer first, if you'd like to?

AJIT JAIN: Hi. Obviously, the starting point, I mean, these situations where there's not enough data to hang your hat on, it's more of an art than a science.

We start off with as much science as we can use, looking at historical data that relates to the risk in particular, or something that comes close to relating to the risk that we're looking at.

And then beyond that, if there's not enough historical data we can look at, then clearly, we have to make a judgment in terms of, what are the odds of something like that happening?

We try — we absolutely, in situations like that, we absolutely make sure we cap our exposure. So, that if something bad happens or we've got something wrong, we absolutely know that how much money we can lose and whether we can absorb that loss without much pain to the income statement or the balance sheet.

In terms of art, it's a difficult situation. More often than not, it's impossible to have a point of view, and we end up passing on it.

But every now and then, we think we can get a price where the subjective odds we have of something like that happening has a significant margin of safety in it. So, we feel it's a risk that's worth taking.

Then finally, the absolute acid test is, I pick up the phone and call Warren. "Warren, here's a deal. What do you think?" (Laughter) OK. Your turn, Warren.

WARREN BUFFETT: OK. (Applause)

CHARLIE MUNGER: It's not easy, and you wouldn't want just anybody doing it for you.

WARREN BUFFETT: No, no. In fact, the only one I would want doing it for us on the kind of things we have sometimes received is Ajit. I mean, it's that simple. There isn't anybody like him.

And as Ajit said, we'll look at a worst case, but we are willing, if we like the odds, and like you say, there's no way to look these up.

We can tell you how many 6.0 or greater earthquakes have happened in the last hundred years in Alaska or California or so on. And there's a lot of things you can look up figures on. Sometimes those are useful, and sometimes they aren't. But there's a lot where you can get a lot of data.

And then there's others that — well, after 9/11, you know, was that going to be the first of several other attacks that were going to happen very quickly? There were planes flying that couldn't — well they couldn't land in Hong Kong, as I remember. I think it was Cathay Pacific couldn't land in Hong Kong the following Monday unless they had a big liability coverage placed with somebody.

I mean, the world had to go on. The people that held mortgages on the Sears Tower all of a sudden wanted coverage. — I think that actually was one — but they were just pouring in, of people that hadn't been worried about something a week earlier, and now they were worried about things involving huge sums.

And there were really only a couple people in the world that would even listen and had the capacity to take on a lot of the deals we were proposed. And there's no book to look up. So, you do — there's a big element of judgment.

Ajit and I — I mean, Ajit's a hundred times better at this than I am, but we do tend to think alike on this sort of thing. You don't want to think too much alike, but we think alike. I've got a willingness to lose a lot of money.

And most, well, virtually every insurance company if they get up to higher limits, they've got treaties in place, and they can only take this much. So, the world was paralyzed on that.

We don't get those, but now obviously. But we do occasionally get inquiries about doing things that really nobody else in the world can do. It's a little like our investment situation, only transferred over to insurance. We don't build a business around it, but we are ready when the time comes.

And Ajit is an asset that no other company in the world has. And we work him. And we actually enjoy a lot talking to each other about these kind of risks, because he'll ask me to think about

what the price should be. And he'll think about — we don't tell each other ahead of time. And then I'll name it, and then he'll say, "Have you lost your mind, Warren?" (Laughs)

And then he'll point something out to me that I've overlooked. And it's a lot of fun, and it's made us a lot of money.

And the shareholders of Berkshire Hathaway are extraordinarily lucky. You can't hire people like Ajit. I mean, you get them once in a lifetime. Charlie?

CHARLIE MUNGER: I don't think we helped him very much. It's really difficult.

WARREN BUFFETT: There will be a time when — I mean, I probably won't be around then — but there will be a time occasionally, just like in financial markets, when things are happening in the insurance world, and basically, Berkshire will be the only one — virtually the only one — people turn to.

CHARLIE MUNGER: But in the past, Ajit, talking to you, has added more than \$50 billion to the balance sheet at Berkshire, by making these oddball calls.

WARREN BUFFETT: And if he hadn't talked to me, it'd be probably 49.9 billion, you know? (Laughs)

But you don't want to try — don't try this at home.

CHARLIE MUNGER: Yeah, that doesn't mean it's easy.

WARREN BUFFETT: No. And it's not very teachable.

CHARLIE MUNGER: No, it isn't very teachable, you're right.

WARREN BUFFETT: No, it is not something that Berkshire has some secret formula someplace for it. It basically is a very unusual talent with Ajit, and —

CHARLIE MUNGER: We're not holding anything back. It's hard.

31. Despite Kraft Heinz problems, Berkshire could partner with 3G again

WARREN BUFFETT: OK, Jay? (Applause)

JAY GELB: This question is on Berkshire's relationship with 3G Capital. Kraft Heinz's recent challenges have raised questions about whether Berkshire's partnership with 3G has become a weakness for Berkshire.

Warren, what are your thoughts on this? And would Berkshire be open to partnering again with 3G in a major acquisition?

WARREN BUFFETT: Yeah, they are our partners, and we joined them. We had a one-page agreement, which I haven't even actually ever reread. I mean, Jorge Paulo, I mean, is a good friend of mine. I think he's a marvelous human being. And I'm pleased that we are partners. It's conceivable that something would come up.

They have more of a taste for leverage than we do, and they probably have more of a taste for paying up, but they also are, in certain types of situations, they'd be way better operators than we would.

I mean, they go into situations that need improvement, and they have improved them. But I think both they and we, I know we did underestimate, not what the consumer is doing so much, but what the retailer is.

And at See's Candy, we sell directly to the consumer, but at Kraft Heinz, they're intermediaries. And those intermediaries are trying to make money. We're trying to make money.

And the brand is our protection against the intermediaries making all the money.

Costco tried to drop Coca-Cola back in, I think 2008, and you can't drop Coca-Cola, you know, and not disappoint a lot of customers.

Snickers bars are the number one candy that Mars makes. And they've been number one for 30 or 40 years. And if you walk into a drugstore, and the guy says, "The Snickers are 75 cents or whatever it might be, and I've got this special little bar my wife and I make in the back of the store, and it's only 50 cents, and it's just as good," you don't buy it, you know. When you're at some other place the next time, you buy the Snickers bar.

So, brands can be enormously valuable, but many of the brands are dependent, most of them — Geico is not, Geico goes directly to the consumer. If we save the consumer money on insurance, they're going to buy it from us.

And our brand, you know — and we'll spend well over a billion and a half on advertising this year, and you think, my God, we started this in 1936, and we were saying the same thing then about saving 15 percent in 15 minutes or something of the sort — not exactly the same — but that brand is huge, and we have to come through on the promise we give, which is to save people significant money on insurance — a great many people. That brand is huge, and we're dealing directly with the consumer.

And when you're selling Kool-Aid or ketchup or, you know, Heinz 57 sauce or something, you are going through a channel, and they would — the phrase was used earlier today. You know,

our gross margin is their opportunity, and we think that the ultimate consumer is going to force them to have our product, and that we will get the gross margin.

And that fight, that tension, has increased in the last five years and I think is likely to increase the next five or ten years. And Charlie is a director of a company that has caused me to think a lot about that subject. Charlie?

CHARLIE MUNGER: Well. What I think is interesting about the 3G situation, it was a long series of transactions that worked very well, and finally there was one transaction at the end that didn't work so well.

That is a very normal outcome of success in a big place with a lot of young men who want to get rich quick. And it just happens again and again. And you do want to be careful.

It's so much easier to take the good ideas and push them to wretched excess.

WARREN BUFFETT: Yeah, that is — no idea is good at any price, and the price settlement is probably something that we worry more about generally than our partners, but we are their partners in Kraft Heinz. And it's not at all inconceivable that we could be partners in some other transaction in the future.

32. Buffett's not worried about strength of Kraft Heinz's brands

WARREN BUFFETT: OK. Station 8.

AUDIENCE MEMBER: Hello Warren and Charlie. Consumer tastes are changing. I think if we asked how many people here in the arena have eaten Velveeta cheese in the last year or so, there'd be only a small handful, maybe more for Jell-O.

3G's playbook of cutting R&D looks to have stifled new product development amidst changing preferences.

So, here's my question. Why continue to hold when the moat appears to be dry? Or do you think it is filling back up?

CHARLIE MUNGER: Well, I don't think the problem was that they cut research or something. I think the problem was, they paid a little too much for the last acquisition.

WARREN BUFFETT: That Jell-O — I can't give you the exact figures. There are certain brands that may be declining 2 percent a year or 3 percent a year in unit sales, and there's others that are growing 1 or 2 percent. There's not dramatic changes taking place at all. I mean, Kraft Heinz is earning more money than Kraft and Heinz were earning six or seven years ago.

I mean, and the products are being used in a huge way. Now it's true that certain — that there are always trends going to some degree, but they have not fallen apart, remotely. And they have widened the margin somewhat.

But it is tougher, in terms of the margin and the price negotiations, probably to go through to the actual consumer. It's become a somewhat tougher passageway for all food companies, than it was ten years ago. It's still a terrific business.

I mean, you know, you mentioned Jell-O or Velveeta. Charlie worked at my grandfather's grocery store in 1940, I worked there in '41. And they were buying those products then, and they buy the products now. The margins are still very good. They earn terrific returns on invested capital. But we paid too much in the case of Kraft.

You can pay too much for a growing brand. I mean, you can pay way too much for a growing brand, probably be easier to be sucked into that. So, I basically don't worry about the brands.

A certain number are very strong, and a certain number are declining a bit. But that was the case 10 years ago. It'll be the case 10 years from now. There's nothing dramatic happening in that.

33. Buffett's biggest problem with Apple is the stock keeps going up

WARREN BUFFETT: OK, we'll take one more, and then we'll break for lunch. Andrew.

ANDREW ROSS SORKIN: Thank you, Warren. Question on technology and the company's biggest holding now.

"Given that Apple is now our largest holding, tell us more about your thinking. What do you think about the regulatory challenges the company faces, for example? Spotify has filed a complaint against Apple in Europe on antitrust grounds. Elizabeth Warren has proposed ending Apple's control over the App Store, which would impact the company's strategy to increase its services businesses. Are these criticisms fair?"

WARREN BUFFETT: Well, again, I will tell you that all of the points you've made I'm aware of, and I like our Apple holdings very much. I mean, it is our largest holdings.

And actually, what hurts, in the case of Apple, is that the stock has gone up. You know, we'd much rather have the stock — and I'm not proposing anything be done about it — but we'd much rather have the stock at a lower price so we could buy more stock.

And importantly, if Apple — I mean, they authorized another 75 billion the other day — but let's say they're going to spend a hundred billion dollars in buying in their stock in the next three years. You know, it's very simple. If they buy it at 200, they're going to get 500 million

shares. They've got 4 billion, 600 million out now. And so they'll end up with 4.1 billion under that circumstance.

If they're buying at 150, they buy in 667 million shares. And instead of owning what we would own in the first case, we'd now — the divisor would be less than 4 billion, and we'd own a greater percentage of it.

So, in effect, a major portion of earnings — at least possibly, it's at least been authorized — will be spent in terms of increasing our ownership without us paying out a dime, which I love for a wonderful business.

And the recent development, when the stock has moved up substantially, actually hurts Berkshire over time. We'll still do — In my opinion, we'll do fine, but we're not going to dissect our expectations about Apple, you know, for people who may be buying it against us tomorrow or something of the sort. We don't give away investment advice on that for nothing.

But we have — all the things you've mentioned, obviously we know about, and we've got a whole bunch of other variables that we crank into it. And we like the fact that it's our largest holding. Charlie?

CHARLIE MUNGER: Well, in my family, the people who have Apple phones, it's the last thing they'll give up. (Laughter)

Afternoon Session - 2019 Meeting

1. Union Pacific has higher profit margins than BNSF

WARREN BUFFETT: OK. If you'll take your seats, we'll proceed in a minute.

And it looks like we're ready for Gregg.

GREGG WARREN: Good morning, Charlie. I have a follow up on the railroad business.

By nearly all measures, BNSF had a solid year in 2018, full-year revenue growth of 11 1/2 percent was better than the 7 1/2 percent topline growth at Union Pacific — which is BNSF's largest direct competitor — came up with, with Burlington Northern seeing both larger increases in average revenue per car unit and total volumes than its closest peer.

Even so, Burlington Northern once again fell short of Union Pacific when it came to profitability, with its operating ratio declining 130 basis points to 66.9 percent, while Union Pacific's ratio fell only 120 basis points to 62.7, further cementing the spread that exists between the two companies' margins, at more than 400 basis points.

Can you explain what is driving the difference in profitability between Burlington Northern and Union Pacific, as theoretically we should not see that wide of a spread between two similar-sized companies that are basically competing for the same business, with the same customers in the western half of the United States?

And while you noted that Burlington Northern is in a wait and see mode with regards to precision-schedule railroading, we've kind of heard the same line historically with regards to GEICO's approach to telematics.

And what worries me here is that the potential now exists for a much wider gap to emerge between profitability levels at Burlington Northern and Union Pacific, which has recently adopted a version of PSR some of which Union Pacific could eventually use to get more price competitive.

CHARLIE MUNGER: Well, Warren knows the answer to that a lot better than I do. My guess is that they work a little harder than we do at billing the rates. But Warren, you answer that one.

WARREN BUFFETT: Yeah. Well, it's true that we receive the lowest ton mile revenue of any of the six big railroads in North America, and there's some explanation for that — obviously, a significant explanation — in the particular types of hauls we have and that sort of thing. We have longer hauls, generally.

But the answer — Union Pacific's profit margin, they talk about operating ratios, but that goes back to the Interstate Commerce Commission. It's really profit margin, pre-tax, pre-interest profit margin. And Union Pacific, at one time, probably 15 or maybe a little more years ago,

they really went off the tracks, so to speak. But they've done a very good job of getting — well, they got a lot of underpriced coal contracts that worked out, as did we.

But they've also — they've done a very good job on expenses. And there's no fundamental reason why the BNSF franchise — I always like the western railroads better than the eastern — not by a dramatic margin — but I think the west will do better in terms of ton miles over time than the eastern roads.

And we've got some great routes, some of which were underwater in March for a while.
(Laughs)

We pay a lot of attention to what's going on at the Union Pacific, as we should.

And the future, it's not like we're losing business to anybody. But they have been operating more efficiently, in effect, than we have during the last few years. And like I said, we take notice of it.

They've cut a lot of people, right here in Omaha. And we'll see what that does in terms of passengers — or in terms of shipper satisfaction.

But we are measuring ourselves very carefully against what they do. And if changes are needed, we'll do that.

We've got a wonderful asset in that business. And when I bought it, I said it's for a hundred years. It's for a lot more than a hundred years. It is a very, very fundamental business. And we've got a wonderful franchise, and we should have margins comparable to other railroads. Charlie?

CHARLIE MUNGER: I don't know much about it.

WARREN BUFFETT: You don't? (Laughter)

2. Buffett: I'm lucky that I can "control my own time"

WARREN BUFFETT: Station 9.

AUDIENCE MEMBER: Hi, Warren and Charlie. My name is Rob Lee (PH) from Vancouver, Canada. Could you please share with us what you value the most in life now? Thank you.

WARREN BUFFETT: Well —

CHARLIE MUNGER: I'd like to have a little more of it. (Laughter and applause)

WARREN BUFFETT: It's the two things you can't buy, time and love. And that, I value those for a long time. And I've been very, very, very lucky in life, in being able to control my own time to an extreme degree. Charlie's always valued that, too.

That's why we really wanted to have money, was so we could do what we damn pleased, basically — (laughs) — in our life. It wasn't six houses or boats or anything. Well, Charlie's got a boat. But it doesn't do us that much good.

But time is valuable. And we are very, very lucky to be in jobs where physical ability doesn't make any difference.

And, you know, we've got the perfect job for a couple of guys with aging bodies. And we get to do what we love to do every day.

I mean, I literally could do anything that money could buy, pretty much. And I'm having more fun doing what I do than doing anything else, and Charlie is designing dormitories. And I mean, he's got an interesting life, and he brings a lot to it.

He still reads, you know, more books in a week than I get done in a month, and he remembers what he reads. So, we've got it very good, but we don't have unlimited time. And whatever we do to free up the time to do what we like to do — and we both maximize that in our lives — we do.

CHARLIE MUNGER: Anybody's lucky if he so that what he spends his time at, he really likes doing. That's a blessing.

WARREN BUFFETT: Yeah, we've had so much good luck in life. It sort of blows your mind. Starting with being born in the United States. And Canada would be fine too, incidentally. I don't want to offend anybody. (Laughter)

3. "We're not in the business of explaining why we own a stock"

WARREN BUFFETT: OK, Carol?

CAROL LOOMIS: This question is from Brian Neal (PH), who writes from the Mayo Clinic Education Site.

"Berkshire owns approximately 200 billion in publicly traded stocks. I appreciate the disclosure of Berkshire's holdings, but I am disappointed by the lack of specific performance information.

"Since investing in publicly owned stocks is so much a part of Berkshire's business, why do you not tell us every year how our portfolio performed?"

WARREN BUFFETT: Well, obviously it could be calculated fairly easily, and it's about 40 percent of Berkshire's value. But 60 percent is the businesses. And if you look at the top ten stocks I would guess, you know, you're down to where beyond those ten stocks you're talking about less than — probably less than 10 percent of Berkshire's value.

So, I — again — we're not in the business of explaining why we own a stock. We're not looking for people to compete to buy it. We have a portfolio of companies where I would say that, of that 200 billion or so, at least 150 billion of them are buying in their stock and increasing our interest every year.

And why in the world should we want to tell a whole bunch of people to go out and buy those stocks so that we end up paying — or the company on our behalf — ends up paying more money for them?

I mean, people get very happy when their stocks go up. But if we're going to own whatever, whether it's Bank of America, whether it's Apple, whether it's any of the big holdings, we will do considerably better in the next ten years if their stocks do terribly during certain periods and that they buy lots of stock in.

It's just exactly like buying it ourselves, except we're using their — they're using our money. But it's so elementary.

And why in the world would we want to go out and tell the world that these stocks should go up so that maybe they can sell or something when it costs us money? And we're not going to be able to move in and out of the stocks to our advantage.

So, our holdings are filed quarterly — our domestic holdings, as it was pointed out earlier — filed quarterly.

But we would rather not tell the world what we own, any more than we'd like to tell them what our strategy is at NetJets or what we're going to do with Lubrizol and what we're working on in the way of better advances in additives or whatever it may be, or where we plan to build a new store for the Furniture Mart or something.

That's proprietary information. And we have to disclose a certain amount, but we're certainly not going to be touting the stocks to other people.

In terms of calculating our performance, you can take the top ten or 12 stocks, and anybody could make the calculation. I mean, at the end of the year the Wall Street Journal runs — all the papers run something — where it says a year-to-date performance or something of the sort. So that's a simple calculation. Charlie?

CHARLIE MUNGER: I've got nothing to add to that.

4. FlightSafety probably won't get more demand for its simulators after Boeing MAX 737 crashes

WARREN BUFFETT: OK. Jonathan.

JONATHAN BRANDT: No one's ever asked a question about FlightSafety, but perhaps this year it's somewhat topical given the 737 MAX controversy. The New York Times spoke to engineers who said that Boeing explicitly designed the MAX in a manner that allowed airline customers to avoid paying for simulators to train their pilots.

Do you expect the worldwide regulatory and commercial response to the MAX's problems to result in increased demand for FlightSafety simulators? And could you please more generally discuss FlightSafety's competitive position and growth prospects?

WARREN BUFFETT: Yeah, well, FlightSafety is — their specialty would be with corporate pilots. They train our NetJets pilots, for example. They have a major facility with simulators for that.

I don't think what's happened with the 737 MAX will have any particular effect. I mean, we have — I don't know how many of the Fortune 100 companies that we do business with, but it's a very significant percentage.

And they train their pilots with FlightSafety because we've got the talent and the simulators like nobody else has for that business. And Charlie, didn't you have that friend of yours that was trying to get Al Ueltschi to pass him when he shouldn't?

CHARLIE MUNGER: What?

WARREN BUFFETT: You remember that story of your friend that wanted to have FlightSafety —

CHARLIE MUNGER: Oh yes.

WARREN BUFFETT: Yeah, why don't you tell them? I mean, Al Ueltschi, who started FlightSafety with a few thousand dollars and a little visual simulator, or whatever it may have been at, LaGuardia, I mean, he really cared about saving lives. And he made a lot of money in the process, but he was dedicated throughout his lifetime to truly train better pilots and reduce the chance of accidents dramatically.

It was a mission with him. And that spirit still continues.

And as I say we've got a — I can't tell you the percentages, I don't know, but I know it's very high — of certainly the corporate business. We have government business, we have some airline businesses and all of that.

But I don't expect any great change in the flight training business. But tell them about your friend, Charlie.

CHARLIE MUNGER: Well, of course, people pass those tests with flying colors, and then some of them just barely pass. And one of my friends just barely passed and they called me and told me. It's (inaudible) of the business.

WARREN BUFFETT: FlightSafety would not —

CHARLIE MUNGER: They care about everything.

WARREN BUFFETT: They care.

CHARLIE MUNGER: They watch the details.

WARREN BUFFETT: They care. And those simulators can cost over \$10 million, I mean, just — and they're dedicated, obviously, to a given model of plane.

You might find it interesting, at NetJets our pilots only fly one model. I mean — most charters and all those, I'm sure they — and incidentally, I think they could fly other models and all that, but we just want them to be flying one model. And we give them the maximum amount of training annually.

And it's — when I bought the company for Berkshire in, I think it was 1998 or thereabouts, you know, the thought obviously bothered me that I would have a significant percentage of people who would be friends of mine that were using it, and you know, you'd hate to have anything happen.

I use it, my family uses it, our managers use it. And there's nobody that cares more about safety. But I don't see — other than at NetJets — it's a first-class operation.

CHARLIE MUNGER: They've never killed a passenger. They had one pilot who hit a glider at 16,000 feet, and it was kind of a difficult landing.

WARREN BUFFETT: It was more than difficult landing —

CHARLIE MUNGER: They've never killed a — it was a woman pilot, yeah.

WARREN BUFFETT: And she was flying the next day. The copilot was kind of taken out of operation for a while. But this woman ended up almost with the control panel in her lap because this guy turned off his battery and hit one of our Hawkers. And she had one shot at the runway and she brought it in.

And we've had some remarkable training and pilots there. You should ask for her if you're flying on NetJets. (Laughter)

5. Buffett on tech investing: "We won't go into something because somebody else tells us it's a good thing to do"

WARREN BUFFETT: Station 10.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, hi. My name is Daphne. I'm from New York and I'm nine years old. And I'm excited to be at the Berkshire meeting, and this is my third year.

WARREN BUFFETT: Wow. (Applause)

You should be rich by now. (Laughter)

AUDIENCE MEMBER: You have often said that investors are well-served by identifying businesses with a wide moat, where the castle behind the moat is run by a king or queen who can be trusted to make good decisions.

In the past, you have applied this advice by investing in businesses with world class strong brands, such as Coke, American Express, and See's, as well as media companies that has helped these brands protect and widen their moats, such as Cap Cities, ABC, and the Washington Post.

In the past, you have also generally avoided investing in technology companies, pointing out how quickly technology changes and how hard it is to build a circle of competence in it.

Today, we seem to be in a world where some of the most dominant companies in the world are technology companies. And we have built powerful platforms, such as Amazon, Google, Facebook, and Microsoft in America, and Alibaba and Tencent in China.

These companies all have wide moats, strong brands, and are led by brilliant — entrepreneurs.

WARREN BUFFETT: That's good. (Laughter)

AUDIENCE MEMBER: My question to you is this: if Berkshire is to honor its tradition of investing in wide moats and strong brands, and especially in companies that are also capital efficient, do you think that Berkshire needs to expand its investing lens to include more of these leading technology platforms?

In other words, do you believe that you need to adapt your model of wide moats and strong brands to embrace, not avoid, technology? (Applause)

CHARLIE MUNGER: I think the answer is maybe. (Laughter)

WARREN BUFFETT: I think the answer is to put her on the board and it'll bring down the average age enormously. We won't get criticized as much.

You're exactly right, in that we do like moats, and we used to be able to identify them in a newspaper that was the only newspaper in town, or in TV stations where we felt the dominant position, we felt the product was underpriced in terms of advertising. We saw it in brands, sometimes.

And it is true that in the tech world, if you can build a moat, it can be incredibly valuable. I've not felt the confidence that I was the best one to judge that in many cases.

It wasn't hard to figure out who was winning at any given time or what their business was about, but there were a huge number of people that knew more about the game than I did. And we don't want to try and win at a game we don't understand. We may hire people, such as Ted (Weschler) and Todd (Combs), that are better at understanding certain areas of investing than I am, or maybe even Charlie is.

But the principles haven't changed. You're right that some of the old ones have lost their moat and you're right that there are going to be companies in the future that have them that will be enormously valuable.

And we hope we can identify one every now and then. But we won't — we'll still stay within where we think we know what we're doing. And obviously, we'll make mistakes even within that area.

But we won't go into something because somebody else tells us it's a good thing to do. I mean, we are not going to subcontract your money to somebody else's judgment. You can take your money and follow somebody else's judgment, but we're not in the business of thinking that if we hire ten people with specialties in this area or that, that it will lead to superior investment results. And we do worry that we could blow a lot of money that way.

So, we'll do our best to enlarge the circle of competence of the people at Berkshire so that we don't miss so many. But we'll miss a lot in the future. We missed a lot in the past.

The main thing to do is to find things where our batting average is going to be high. And if we miss the biggest ones, that really doesn't bother us, as long as the things we do with money work out OK. Charlie?

CHARLIE MUNGER: Well, I think we've still got an awful lot of companies with big moats, and a lot of them are very — and some are industrial brands that are just incredibly strong in the niches we're in.

So, Berkshire shareholders don't need to worry about we're just one big morass of unprofitability or anything like that. But we have not covered ourselves with glory in the new fields.

WARREN BUFFETT: Yeah. We won't end up all in buggy whips, though, or anything. But it's a very good question, and it's what we focus on all the time. And I hope —

CHARLIE MUNGER: We're trying to improve.

WARREN BUFFETT: And we hope we see you back here for your fourth next year.

6. "In the end, Berkshire should prove itself over time"

WARREN BUFFETT: Becky? (Applause)

BECKY QUICK: This question comes from Stuart Boyd (PH), who's a chemical engineer from Australia.

He says, "Currently Berkshire would be incredibly difficult for an activist investor to target, because number one, Warren, your ownership stake is large. Number two, shareholders appreciate the business is more valuable operating under the Berkshire umbrella rather than being sold off in pieces.

"And number three, the sheer size or market capitalization of Berkshire is an entry barrier for most activist investors.

"Warren and Charlie, after your ownership has been completely distributed, will Berkshire be more vulnerable to activist investors? I'm guessing this isn't something that keeps you up at night, but thought it was worth asking."

CHARLIE MUNGER: No, it's going to happen quite a few decades after my death.

WARREN BUFFETT: Yeah. It —

CHARLIE MUNGER: I don't think I'll be bothered much by it. (Laughter)

WARREN BUFFETT: No, anything could happen. It's a low probability. It can't happen for a lot of years, in terms of the way my stock gets distributed and in terms of the way other stock is held.

But in the end, Berkshire should prove itself over time. I mean, there are no perpetuities. And it deserves to be continued in its present form. It has a lot of attributes that are maximized by being in one entity, which people don't fully understand.

I think if you spin off something that would command a high PE that therefore value has been unlocked, which is totally nonsense. I mean, it's already built in.

One day out, you know, you might have an extra 3 percent or 5 percent in price, but over the years, we want to keep the wonderful businesses.

But eventually I think the culture will remain one of a kind. I think that we will be able to do things other people can't do.

I think that the advantages of having them in one spot will likely be significant over time. And if that happens, then no activist is going to take it over.

And if the model doesn't work for some reason over a long period of time, then something else should happen. Charlie?

CHARLIE MUNGER: Nothing more.

WARREN BUFFETT: OK.

7. GEICO trying to improve its loss ratio as it competes with Progressive

WARREN BUFFETT: Jay.

JAY GELB: This question is on GEICO. Progressive is gaining the most market share among the major auto insurers, based on its presence in the direct and independent agency channels, as well as now bundling its auto and homeowners insurance coverage.

How does GEICO plan on responding to competitive threats so that it can retain its place as the second-largest auto insurer? I was hoping we could also hear on this topic from Ajit (Jain) or GEICO's management. Thank you.

WARREN BUFFETT: OK. Progressive is a very well-run business. GEICO is a very well-run business. And I think they will, for a long time, be the two companies that the rest of the auto insurance industry has trouble not losing share to. But there's, you know, I think — I've always thought for a long, long time, Progressive has been very well run.

They have an appetite for growth. Sometimes they copy us a little, sometimes we copy them a little. And I think that'll be true five years from now and 10 years from now.

And we sell substantial amounts of homeowners insurance. We have an agency arrangement with that. We were in the business of writing it ourselves, until Hurricane Andrew, when a decision was made — we didn't control it then — but the decision was made that the homeowners, essentially, you could lose as much in one year as you made in the previous 25 years. And the float isn't as large.

So, we became a company that placed our customers' desire for homeowners with several other large and solid organizations.

The big thing is auto insurance. And we grew in the first quarter about 340,000 policies, net, which will look quite good compared to anybody but Progressive.

And that was quite a bit more than last year, but not as good as two years ago. And the profit margin was in the nine-point area. So, I feel extremely good about GEICO, I mean, what has been built there by Tony (Nicely) and his people is perfect, but I would feel fine —

We don't own any Progressive, but I think that Progressive is an excellent company, and we will watch what they do, and they will watch what we do. And we will see, five years from now or 10 years from now, which one of us passes State Farm first. Charlie? Oh, and Ajit, would you like?

AJIT JAIN: Well, the underwriting profit is really a function of two major variables. One is the expense ratio and the other is the loss ratio, without getting too technical.

GEICO has a significant advantage over Progressive when it comes to the expense ratio, to the extent of about seven points or so.

On the loss ratio side, Progressive does a much better job than GEICO does. They have, I think, about a 12-point advantage over GEICO. So, net-net, Progressive is ahead by about five points.

GEICO is very aware of this disadvantage on the loss ratio that they are suffering, and they're very focused on trying to bridge that gap as quickly as they can. They have a few projects in place, and, you know, sometimes GEICO is ahead of Progressive. Right now, Progressive is ahead of GEICO. But I'm hopeful they'll catch up on the loss ratio side and maintain the expense ratio advantage as well. Thank you.

WARREN BUFFETT: GEICO has gained market share, essentially — I'd have to look at the figures for sure — but virtually every year since Tony took over. And I would bet significant money that GEICO increases its market share in the next five years. And I think it will, for sure, this year.

So, it is a terrific business. And — but Progressive is a terrific business. And we'll — as Ajit says, we've got the advantage in expenses, and we will have an advantage in expenses. And then the question is, are we —

They have a very sophisticated way of pricing business. And the question is whether we give some of that five points back — or six points back — in terms of loss ratio. We are working very hard at that, but I'm sure they're working very hard too to improve their system.

So, it's a — to some extent it's a two-horse race, and we've got a very good horse.

CHARLIE MUNGER: But Warren, in the nature of things, every once in a while, somebody's a little better at something than we are.

WARREN BUFFETT: Ha. You've noticed. (Laughter)

CHARLIE MUNGER: Yeah. I noticed.

WARREN BUFFETT: Yeah. I'd settle for second place in a lot of the businesses.

8. Try to have a big circle of competence but be realistic about its perimeter

WARREN BUFFETT: OK, station 11.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, thank you for taking my question. My name is Feroz Qayyum and I'm from Mississauga in Canada, and now live in New York.

My question is how to best emulate your success in building your circle of competence. Given the environment today in investing is a lot more competitive than when you started out, what would you do differently, if anything at all, when building your circle?

Would you still build a very broad, generalist framework? Or would you build a much deeper but narrower focus, say on industries, markets, or even a country? And if so, which ones would interest you? Thank you.

WARREN BUFFETT: Yeah, well, you're right. It's much more competitive now than when I started. And you would — when I started, I literally could take the Moody's industrial manual and the Moody's banks and financial manual and I could go through page by page, at least run my eyes over every company and think about which ones I might think more about.

It's — it's important — I would just do a whole lot of reading. I'd try and learn as much as I could about as many businesses, and I would try to figure out which ones I really had some important knowledge and understanding that was probably different than, overwhelmingly, most of my competitors.

And I would also try and figure out which ones I didn't understand, and I would focus on having as big a circle as I could have, and also focus on being as realistic as I could about where the perimeters of my circle of competence were.

I knew when I met (GEICO executive) Lorimer Davidson in January of 1951, I could get insurance. I mean, what he said made so much sense to me in the three or four hours I spent with him on that Saturday.

So, I dug into it and I could understand it. My mind worked well in that respect.

I didn't think I could understand retailing. All I'd done is work for the same grocery store that Charlie had, and neither one of us learned that much about retailing, except it was harder work than we liked.

And you've got to do the same thing, and you've got way more competition now. But if you get to know even about a relatively small area more than the other people do, and you don't feel the compulsion to act too often, you just wait till the odds are strongly in your favor. It's still a very interesting game. It's harder than it used to be. Charlie?

CHARLIE MUNGER: Well, I think the great strategy, for the great mass of humanity, is to specialize. Nobody wants to go to a doctor that half-proctologist and half-dentist, you know? (Laughter)

And so, the ordinary way to succeed is to narrowly specialize. Warren and I really didn't do that. And that — and we didn't because we prefer the other type of activity. But I don't think we could recommend it to other people.

WARREN BUFFETT: Yeah, a little more treasure hunting in our day, and it was easy to spot the treasures —

CHARLIE MUNGER: We made it work, but it was kind of a lucky thing.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: It's not the standard way to go.

WARREN BUFFETT: The business, at least I best understood, actually was insurance. I mean — and I had very little competition. You know, I went to the insurance department in Harrisburg, Pennsylvania. I remember one time I drove there just to check on some Pennsylvania company. And this is when you couldn't get all this information on the internet.

And I went in and I asked about some company, and the guy said, "You're the first one that's ever asked about that company." And there wasn't a lot.

I went over to the Standard and Poor's library on Houston — Houston — Street, I guess they call it. And I would go up there and ask for all this obscure information. And there wasn't anybody sitting around there. They had a whole bunch of tables that you could set and examine things through. So, there was less competition.

But if you know even one thing very well, it'll give you an edge at some point. You know, it's what Tom Watson Sr. said at IBM, you know. "I'm no genius, but I'm smart in spots and I stay around those spots." And that's basically what Charlie and I try and do. And I think that's probably what you can do. But you'll find those spots in —

CHARLIE MUNGER: Yeah, we did it in several fields. That's hard.

WARREN BUFFETT: And we got our head handed to us a few times, too.

9. Berkshire is strong on the environment but won't do expensive reports to prove it

WARREN BUFFETT: OK, Andrew?

ANDREW ROSS SORKIN: Thanks, Warren. Governance question from a shareholder.

Larry Fink of BlackRock has predicted that in the near future, all investors will be using ESG — environmental, social, governance — metrics to help determine the value of a company. I'm worried we don't score well on everything from climate to diversity to inclusion. How well do you think Berkshire measures up on those metrics, and are they valuable metrics?

WARREN BUFFETT: I think in reality we measure up well, but we don't participate in preparing reports for anybody that asks about it.

And we have this idea that even though all shareholders are equal, we sort of — we prefer individual shareholders. We actually prefer people we know as co-owners.

And we don't want to be preparing a lot of reports and asking 60 subsidiaries each to do something, where they'll set up a team, and they'll mail things to headquarters, and then we'll supply them to somebody who, if our stock goes up some, is probably going to sell it anyway.

We want our managers to do the right things. We give them enormous latitude to do that. And I think that our batting average really is quite good.

You saw that in the movie, we talked about having a hundred percent of the electricity we sell in Iowa come from, essentially, wind generation. Now that doesn't mean that we get to do it 24 hours a day. We sell some and we buy it. But essentially, we will be creating as much wind energy as all of our customers use in electricity.

There's one competitive — there's one other utility — electric utility — that's about our size — roughly our size — in Iowa, and they have practically no wind resources. And the wind blows where they exist, too. But we have — we will have that hundred percent — and as a matter of fact, it's a moving target, because we do so well — partly — we do so well on wind generation that a number of the high-tech companies want to locate in Iowa and get clean energy from us at very low prices. And therefore, the moving target becomes our growth in customers in that area.

But we are not going to put out a — we're not going to spend the time of the people at Berkshire Hathaway Energy responding to questionnaires or trying to score better with somebody that is working on that.

It's just, we trust our managers and I think the performance is at least decent. And we keep expenses and needless reporting down to a minimum at Berkshire.

We do not get — and I mentioned this in the annual report — I can't imagine another company like it — but here we are, with 500 billion of market capitalization — we do not have a consolidated P&L monthly. We don't need it.

Now I can't imagine any other organization doing that, but we don't need it. And we're not going to tie up resources — people resources — doing things we don't need to do just because it's the sort of standard procedure in corporate America.

And corporate America is very worried about, in general, they're very worried about whether somebody's going to upset their apple cart, you know, with activists and everything.

So, they want to be very sure that every shareholder is happy on issues like that. And in the end, fortunately, we don't have to worry about that. So, we don't have to run up a lot of expenses doing things that don't actually let us run the business better. Charlie?

CHARLIE MUNGER: Well, I think at Berkshire the environmental stuff is done one level down from us. And I think Greg Abel is just terrific at it. And so, I think we score very well.

When it gets to so-called best corporate practices, I think the people that talk about them don't really know what the best practices are. They just know what they think are the best practices. And they determine that based on what will sell, not what will work.

And so, I like our way of doing things better than theirs, and I hope to God we never follow their best practices. (Applause)

10. "Independent" board members aren't really independent

WARREN BUFFETT: I'd like to point out one thing on independent directors. I mean, I have been on 20 public company corporate boards, not counting any Berkshire subsidiaries. So, I've seen a lot of corporate boards operate. And the independent directors, in many cases, are the least independent.

I mean, if the income you receive as a corporate director — which typically may be around \$250,000 a year — now, if that's an important part of your income, and you hope that some other corporation calls the CEO and says, "How's so-and-so as a director?" and the current CEO — your CEO — says, "Oh, he's fine and never raises any problems," and then you get on another board at 250,000 and that's an important part, how in the world is that independent? I mean, I really, just an observation. (Applause)

I can't recall, particularly, any independent director — where their income from the board was important to them — I can't recall them ever doing anything in board meetings or committee

meetings that actually was counter to the interest — you know, they put them on the comp committee.

They're just not going to upset the apple cart, because what they're — and I'd probably behave the same way in the same position. I mean, if \$250,000 a year is important to you, why in the hell would you behave in a way that's going to cause your CEO to say to the next CEO, "This guy acts up a little bit too much. You really better get somebody else." It's the way it works. But they've —

CHARLIE MUNGER: I think it works a little worse than Warren's telling you. (Laughter)

WARREN BUFFETT: Yeah, Charlie and I —

CHARLIE MUNGER: It's really awful.

WARREN BUFFETT: It's awful. I mean, we —

CHARLIE MUNGER: And not only that, Warren and I are — we occupy the niche for pomposity very well ourselves. We don't need any more of it. (Laughter)

WARREN BUFFETT: Charlie and I were on one board. Well, I was on one board, actually, a long time ago where we owned a very significant percentage of the company. And the rest of the board was almost exclusively customers of the company. But not owners. They had absolutely token holdings. And at one point we were looking at something where a tax decision was being made in terms of the distribution of some securities.

And it was a lot of money that was involved. And one of the other directors said, "Well, let's just swallow the tax." Well, his swallowing amounted to about \$15 or something — (Laughs)

I said, "Let's parse this sentence out. Let's swallow the tax. That's let us swallow the tax. So, who wants to swallow an equal amount, you know, to me?"

It's — you know, it's — you don't get invited to be on boards if you belch too often at the dinner table —

CHARLIE MUNGER: Well, at Blue Chip Stamps we had a director who said, "I don't see why you guys get to be so important just because you own all the shares."

WARREN BUFFETT: Yeah. (Laughter)

Charlie and I used to have to cool off after the Blue Chip Stamps meetings, because we and Rick Garrett owned what percent, probably?

CHARLIE MUNGER: Oh, 50 percent.

WARREN BUFFETT: Yeah, 50 percent, and they'd appointed all these —

CHARLIE MUNGER: They were all members of the Rotary Club.

WARREN BUFFETT: It came out of a government settlement or something. And it was not an ideal form of decision making. And they just had a different calculus in their mind than we did. And I can understand it, but I'm not going to replicate it. (Laughs)

11. "We will put a lot of money into energy" with capital spending at utilities

WARREN BUFFETT: OK, Gregg.

GREGG WARREN: Warren and Charlie, U.S. electricity demand has flatlined during the past decade, but could potentially pick up over the next decade with three emerging sources of demand — electric vehicle charging, datacenters, and cannabis cultivation — expected to account for more than 5 percent of total U.S. electricity demand.

Utilities will have to work hard to benefit from this new demand, though, much of which is likely to accrue to states in the South Atlantic, Central, West, and Mountain regions, with the greatest benefit going to firms that invest in grid expansion, smart networks, reliability, and renewable energy.

While Berkshire Energy has been aggressive with its capital investments, and already has some of the lowest electricity rates in the areas where it competes, it seems like the firm is winding down its annual spending at a time when more might actually be required.

With annual spending expected to fall from around 6 billion, on average, annually to around 4 billion in 2021, with two-thirds of that spending being more maintenance driven than growth.

Is there any one area where you feel Berkshire Energy might need to commit more capital over the next decade to ensure that it captures this future expected demand growth, much as it already has with wind power in western Iowa, which is now populated with a lot of data centers, and for territories where demand growth is expected to be the strongest but where Berkshire does not have a presence, are there any avenues aside from acquisitions for the company to put capital to work?

WARREN BUFFETT: I'm going to throw that over to Ajit in just a second. But I will tell you that we have three owners of Berkshire Hathaway Energy. We are the 91 percent owner. And there are no three owners that are more interested in pouring money into sensible deals within the utility industry or are better situated in terms of the people we have to maximize any opportunities. We have never had a penny of dividends in — whatever it is — close to 20 years of owning MidAmerican Energy.

And other utility companies pay high dividends. They really — they just don't have the capital appetite, essentially, that we do. So, it's just a question of finding sensible projects.

And I would say that there's no group that is as smart about it, as motivated about it as our group. And with that I'll turn it over to Greg.

CHARLIE MUNGER: In short, we're about as good as you can get, and you should worry about something else.

WARREN BUFFETT: Yeah. (Laughter)

But Greg, could you stand up and talk about —? We really hope to spend a lot of money in energy.

GREG ABEL: Yeah, yeah. Afternoon. Yeah, Gregg, you touched on it. A couple critical areas we go forward is to look realistically in the '21, 2022 timeframe. Because as you touched on, we've got a great portfolio as we finish out 2019, 2020. And it's really been focused on building new renewable energy projects in Iowa, expanding the grid.

But equally, we do have those opportunities in our other utilities. The footprint in Iowa, realistically, is getting pretty full. As we hit a hundred percent renewables — Warren touched on it — every time we get a new data center, that means we can build another 300 megawatts of renewables. We'll continue to do that.

But when you look at PacifiCorp, where we serve six states in the Northwest, we've really just embarked on an expansion program there.

The first part was to build significant transmission, so expand the grid, and then start to build renewables. But just to give you some perspective of the regulation that exists in place, we started that project in 2008. And we're realistically building the first third of it. But we do have the planning in place for the second phase and the third phase, and that's what you'll see coming into place in 2021 and in '23.

And the reality is we'll continue to do that at NV Energy, with really, again, the focus being on both grid expansion, so we can move the resources, and then supplementing it with renewables. So, it's exactly what you've touched on.

And we haven't identified the specific projects yet, so we never put them in our capital forecast that we disclose to folks. But as they firm up and we know that they will go forward, clearly you'll see some incremental capital. And that's capital we clearly earn on behalf of the Berkshire shareholders as we deploy it. Thank you.

WARREN BUFFETT: We will put a lot of money into energy. (Laughs)

CHARLIE MUNGER: Yeah, we're really in marvelous shape in this department.

WARREN BUFFETT: Incidentally, you know, Walter Scott, I mean, he gets excited looking at all these projects, and goes out and visits them. He knows way more about the business — and he's forgotten more about it than I'll ever know.

But we've got a great partnership. We've got unlimited capital. We'll continue to have it. And there's needs for huge capital in the industry.

So, I think 10 years from now or 20 years from now, our record will be looked at and there'll be nothing like it in the energy business.

CHARLIE MUNGER: Well, Greg, is there anybody ahead of where we are in Iowa in terms of energy?

GREG ABEL: Charlie, there's realistically no one ahead of us in the U.S., let alone in Iowa. When you look at the amount of energy we produce relative to what our customers consume, we really do lead the nation and Iowa.

CHARLIE MUNGER: And aren't our rates about half that of our leading competitor in Iowa to boot?

WARREN BUFFETT: About half. Close.

GREG ABEL: Exactly. We're right in that range.

CHARLIE MUNGER: If this isn't good enough for you, we can't help you. (Laughter)

WARREN BUFFETT: Incidentally, I mean, we sell electricity five miles from here. Greg, is that correct?

GREG ABEL: Right across the river.

WARREN BUFFETT: Yeah, right across the river. And, you know, the wind blows the same and all that sort of thing. And the public power district here, in Nebraska, going back to George Norris, has always been a public power state. There's no — capitalism doesn't exist in the electric utility field in Nebraska.

So, they have had the advantage of selling tax-exempt bonds. We have to sell taxable bonds, which raises cost to some degree. They have a big surplus, which they don't have to pay dividends on or anything else. And our rates are cheaper than theirs, you know, basically.

I mean, we're very proud of our utility operation.

12. Why Berkshire doesn't put its unspent cash into a stock index fund

WARREN BUFFETT: Carol?

CAROL LOOMIS: "Warren, you are a big advocate of index investing, and of not trying to time the market. But by your having Berkshire hold such a large amount of cash in T-bills, it seems to me you don't practice what you preach.

"I'm thinking that a good alternative would be for you to invest most of Berkshire's excess cash in a well-diversified index fund until you find an attractive acquisition or buy back stocks.

"Had you done that over the past 15 years, all the time keeping the \$20 billion cash cushion you want, I estimate that at the end of 2018, the company's 112 billion balance in cash, cash equivalents, in short-term investments and T-bills, would've instead been worth about 155 billion.

The difference between the two figures is an opportunity cost equal to more than 12 percent of Berkshire's current book value. What is your response to what I say?" And I forgot to say the question is from Mike Elzahr, who is with the Colony Group, located in Boca Raton, Florida.

WARREN BUFFETT: That's a perfectly decent question, and I wouldn't quarrel with the numbers. And I would say that that is an alternative, for example, that my successor may wish to employ. Because, on balance, I would rather own an index fund than carry Treasury bills.

I would say that if we'd instituted that policy in 2007 or '08, we might have been in a different position in terms of our ability to move late in 2008 or 2009.

So, it has certain — it has certain execution problems with hundreds of billions of dollars than it does if you were having a similar policy with a billion or 2 billion or something of the sort.

But it's a perfectly rational observation. And certainly, looking back on ten years of a bull market, it really jumps out at you.

But I would argue that if you were working with smaller numbers, it would make a lot of sense. And if you're working with large numbers, it might well make sense in the future at Berkshire to operate that way.

You know, we committed 10 billion a week ago. And there are conditions under which — and they're not remote, they're not likely in any given week or month or year — but there are conditions under which we could spend a hundred billion dollars very, very quickly.

And if we did — if those conditions existed — it would be capital very well deployed, and much better than in an index fund.

So, we've been — we're operating on the basis that we will get chances to deploy capital. They will come in clumps in all likelihood. And they will come when other people don't want to allocate capital.

Charlie, what do you think about it?

CHARLIE MUNGER: Well, I plead guilty to being a little more conservative with the cash than other people. But I think that's all right.

We could have put all the money into a lot of securities that would've done better than the S&P with 20/20 hindsight. Remember, we had all that extra cash all that period, if something had come along in the way of opportunities and so on.

I don't think it's a sin to be a little strong on cash when you're as big a company as we are. We don't have to —

I watched Harvard use the last ounce of their cash, including all their prepaid tuition from the parents, and plunge it into the market at exactly the wrong moment and make a lot of forward commitments to private equity. And they suffered, like, two or three years of absolute agony. We don't want to be like Harvard.

WARREN BUFFETT: Plus timber and a whole bunch of —

CHARLIE MUNGER: What?

WARREN BUFFETT: Plus timber. And I mean —

CHARLIE MUNGER: Yeah, yeah. We're not going to change. (Laughter and applause)

WARREN BUFFETT: We do like having a lot of money to be able to operate very fast and very big. And we know — and maybe we won't — we know we won't get those opportunities frequently.

I don't think — certainly, you know, in the next 20 or 30 years there'll be two or three times when it'll be raining gold and all you have to do is go outside. But we don't know when they will happen. And we have a lot of money to commit.

And I would say that if you told me I had to either carry short-term Treasury bills or have index funds and just let that money be invested in America generally, I would take the index funds.

But we still have hopes. And the one thing you should very definitely understand about Berkshire is that we run the business in a way that we think is consistent with serving shareholders who have virtually all of their net worth in Berkshire. I happen to be in that position myself, but I would do it that way under any circumstances.

We have a lot of people who trust us, who really have disproportionate amounts of Berkshire compared to their net worth, if you were to follow standard investment procedures.

And we want to make money for everybody, but we want to make very, very sure that we don't lose permanently money for anybody that buys our stock somewhere around intrinsic business value to begin with.

We just have an aversion to having a million-plus shareholders, maybe as many as two million, and having a lot of them ever really lose money, if they're willing to stay with us for a while.

And we know how people behave when the world, generally, is upset. And they want to be with something — I think they want to be with something they feel is like the Rock of Gibraltar. And we have a real disposition toward that group.

13. Fannie Mae and Freddie Mac should do more loans for manufactured housing, even if it hurts Clayton's profits

WARREN BUFFETT: Jonathan?

JONATHAN BRANDT: Freddie Mac and Fannie Mae have new financing programs for manufactured home loans that I'm guessing could finally put purchasers of those homes who need mortgages on a somewhat more level playing field with those buying site-built homes.

How positive an effect do you expect these new programs to have on manufactured home demand? And how might the programs affect Clayton's sizable profits from lending? Will Clayton sell more loans to Freddie and Fannie, and does that help profits even if spreads compress?

WARREN BUFFETT: Well, it may not help profits, but it would — it definitely is good if the Freddie and Fannie are authorized to do more lending against manufactured homes.

Manufactured homes are a very reasonable for people to get decent housing and have a home. And they are hard to finance to some degree. The local banks frequently do it, but the big lenders haven't wanted to do it. They are —

There is the possibility, or the likelihood, that Freddie and Fannie are going to expand. We already sell — I don't know whether it's 10 million a month of loans or something like that — to Freddie and Fannie.

But it would be very good for America, in my view, if Freddie and Fannie did more in that area. Obviously, we would sell some more homes, but we would lose financing, and we might come out behind, we might come out ahead. But I think it would a good thing to do. Charlie?

CHARLIE MUNGER: Well, I think Freddie and Fannie will finance more and more homes, and I think they'll do it more and more of it through Clayton. And they'll do it because Clayton is very trustworthy, and will do a very good job at making good housing at cheap prices for people.

And I think Clayton will get bigger and bigger and bigger as far ahead as you can see. And the guy's young, he doesn't look like Warren and me. Not at all.

WARREN BUFFETT: We've got a perfect managerial group at Clayton, and we're expanding our site-built homes. We just closed on a builder a couple — a few days ago. And we now have nine different — I believe — nine different site-built home operations, and we didn't have any a few years ago.

And we think extraordinarily well of Kevin Clayton and his group. Our directors met last year in Knoxville and viewed the Clayton operation for the second time. So, we like the idea of Clayton expanding, and we like the idea of more people having very affordable housing.

During the 2008 and '09 recession, our borrowers — who had very low FICO scores on average, I mean compared to typical home buyers, and they — if they kept their jobs, they made the payments. I mean, they wanted that home, and the home was an enormously important item to them. And we had various programs that helped them as well.

But our loan experience was far better than people anticipated under the stress that existed then. But it was because a home really means something to people. And absent losing jobs or sickness — and, like I say, we have some programs to help people — they make the payments, and they have very decent living.

But they would get that even cheaper if Freddie and Fannie expanded their programs. And, like I say, I hope they do.

14. "Ingenious" capitalism will replace jobs lost to automation

WARREN BUFFETT: OK, station 2.

AUDIENCE MEMBER: Hi. Hi Warren, hi Charlie. My name is Carrie and this is my daughter, Chloe. She's 11 weeks. It's her very first Berkshire meeting. (Laughter)

We're from San Francisco, and we have a question on employment for you. As both a major employer and a producer of consumer goods, what do you make of the uncertain outlook for good full-time jobs with the rise of automation and temporary employment?

WARREN BUFFETT: Well, if we'd asked that question 200 years ago, and somebody said, "With the outlook for development of farm machinery and tractors and combines and so on —" meaning that 90 percent of the people on farms were going to be — lose their job — it would look terrible, wouldn't it?

But our economy and our people, our system, has been remarkably ingenious in achieving whatever we have now — 160 million jobs — when throughout the period ever since 1776, we've been figuring out ways to get rid of jobs. That's what capitalism does, and it produces more and more goods per person.

And we never know exactly where they're going to come from. I mean, it — I don't know if you were whatever occupation — well, if you were in the passenger train business, I mean, you know, you were going to — that was going to change.

But we find ways, in this economy, to employ more and more people. And we've got now more people employed than ever in the history of the country, even though company after company in heavy industry and that sort of thing, has been trying to figure out, naturally, how to get more productive all the time, which means turning out the same number of goods with fewer people, or turning out more goods with the same number.

That is capitalism. I don't think you need to worry about American ingenuity running out. I mean, if you look at people in all kind of businesses, and they like to make money, but they really like to be inventive, you know. They like to do things.

And this economy, it works. It will continue to work. And it will be very — it's very tough in certain industries, and there will be dislocations. You know, we won't be making as many horseshoes and that sort of thing when cars come along and all that.

But we do find ways now to employ whatever we're employing — 155, whatever it is — million people, and supporting a population of 330 million people when we started with 4 million people, with 80 percent of the labor being employed on farms.

So, the system works and it will continue to work. And I don't know what the next big thing will be. I do know there will be a next big thing. Charlie?

CHARLIE MUNGER: Well, we want to shift the scut work to the robots to the extent we can. That's what we were doing, as Warren said, for 200 years.

Nobody wants to go back to being a blacksmith, or scooping along the street, picking up the horse manure, or whatever the hell people used to do. We're glad to have that work eliminated.

And a lot of this worry about the future comes from leftists who worry terribly that the people at the bottom of the economic pyramid have had a little stretch when the people at the top got ahead faster.

That happened by accident because we were in so much trouble that we had to flood the world with money and drive interest rates down to zero. And, of course, that drove asset prices up and helped the rich.

Nobody did that because they suddenly loved the rich, it was just an accident, and it will soon pass.

We want to have all this productivity improvement, and we shouldn't worry a little about the fact that one class or another is a little ahead at one stretch.

WARREN BUFFETT: Charlie and I — (applause) — we worked in a grocery store. And when people ordered a can of peas, we had ladders that we climbed up to reach the can of peas, and then we placed it in a folding box, and then we put it on a truck. And if you looked at the amount of food actually transferred between the producer and the person who consumed it, and the number of people involved in the transaction, you know, it was — I don't know whether it was one-third or one-quarter or one-fifth as efficient as the best way now to get food delivered to you. And —

CHARLIE MUNGER: And the food was worse.

WARREN BUFFETT: (Laughs) And my grandfather, you know, was distressed about the fact that this particular credit and delivery kind of store would be eliminated. And it was eliminated, but society —

CHARLIE MUNGER: It's coming back.

WARREN BUFFETT: —addressed the — pardon?

CHARLIE MUNGER: It's coming back.

WARREN BUFFETT: It's coming back, but more efficiently. (Laughter)

Anyway, we've seen a little creative destruction. And frankly, we're glad that it freed us up to go into the investment business. Worked out better for us.

15. Regulations can be “irritating,” but they're needed for banks and insurance

WARREN BUFFETT: Becky?

BECKY QUICK: This question comes from Brian Gust of Grafton, Wisconsin. He's talking about regulators and politicians. It says, “The Berkshire Hathaway investment portfolio holds several large financial institutions that are heavily regulated and are politically charged.

“Do you feel that, in some cases, the regulators and/or politicians are running the big banks instead of the CEO and the board of directors?”

CHARLIE MUNGER: Sure. (Laughter) But not too much.

WARREN BUFFETT: No, insurance has been regulated — it happens to be regulated primarily on a state basis — but insurance has been regulated ever since we went into it, and it hasn't — you know, when I looked at GEICO, it was doing 7 million of business. And, you know, it will do 30-odd billion of — billion — of business now. And it's been regulated the whole time.

And regulation can be a pain in the neck, generally, but on the other hand, we don't want a bunch of charlatans operating in the insurance business. And insurance actually lends itself to charlatans because you get handed money and you give the other guy a promise.

And I like the fact that there is regulation in the insurance business, or the banking business. It doesn't mean it can't drive you crazy sometimes or anything of the sort, but those businesses should be regulated. It — they're too important.

And anytime you can take other people's money, and they go home with a promise and you go home with the money, I don't mind a certain amount of regulation in those businesses. Charlie?

CHARLIE MUNGER: Yeah. You're using the government's credit because you have deposit insurance, there's an implicit bargain. You can't be too crazy with what you do with the money. That's a perfectly reasonable —

And I absolutely believe that we should have a regulation system that involves supervision of risk-taking by banks.

It got particularly bad in the investment banks at the peak of the real estate crisis, and the behavior was — there's only word for the behavior — it was disgusting. And it was pretty much everybody.

Warren, you — it's hard to think of anybody who stayed sane in that boom. They felt the other guy's doing dumb things, I've got to do it, too, or I'll be left out. What a crazy way to behave.

And so, sure, there's some intervention, but there probably has to be.

WARREN BUFFETT: You want a Food and Drug Administration. Yeah. You'll be unhappy with how they do it, if you're in the business and all that, but — and, you know, I find any kind of regulation irritating. But nevertheless, it's good for the system.

And actually, a number of regulators, you know, I would say that they've really been quite sensible about regulation. But you don't feel that way when you're being told how to run your business.

But as Charlie says, you wouldn't want to be a bank that ran in an unregulated system where anybody could come in and do all kinds of things that would actually have consequences that drew you into the problems that they created themselves.

We had the Wild West in banking long ago, and it produced a lot of problems in the 19th century.

16. Shareholders don't want or need very detailed information on the subsidiaries

WARREN BUFFETT: Jay?

JAY GELB: For the past several years, in Berkshire's annual shareholder letter, there's been increasingly less detail provided on its operating businesses and financial performance.

For example, the company is no longer providing details on the finance and financial product segment, or a balance sheet for the manufacturing, service, and retail segment, or a breakdown of float by unit in the insurance business.

For a company as large and diversified as Berkshire, why are investors being provided less information than previously?

WARREN BUFFETT: Well, I don't think we actually provide less information. We may present it in a somewhat different form from year to year, just — and then this year, for example, you know, I started my letter, as usual, in my mind as saying, "Dear Doris and Birdie," my sisters, to tell them what I would tell anybody that had a very significant proportion of their net worth in Berkshire, who is intelligent, did not know all the lingo of our various businesses, that would read a lot of words, because they did have a large investment. So, if I explained anything, and did a decent job, that they would understand what I was talking about.

And I tell them that in the language that I think will be understandable to a significant percentage of a million-plus people who have all kinds of different understanding of accounting and all that sort of thing. I tell them the information I would want to hear on the other side.

Now, if I was a competitor, and I wanted to know what one of our furniture stores was earning or something of the sort, you know, I might love it, but it doesn't really make any difference.

If you're talking about a \$500 billion organization, if you understand our insurance business, in terms of giving you the picture, I think, in three or four or five pages — you know, actually we've got a whole bunch of stuff required by the SEC about loss reserve development.

I think you can write a 300-page report that gives a whole lot less information than a 50-page report. And you lose people.

So, I try to tell them — like I say, in my mind, it's my sisters — I try to tell them what I would tell them if we had a private business and they owned a third of it each, and I owned a third, and once a year, they like to get filled in. And they don't know what a combined ratio means because it's a dumb term that everybody uses. And the important thing is to call it a profit margin.

They don't know what the operating ratio is in the railroad business, and it's an obsolete term. It'd be better to call that a profit margin. But the lingo — we're not writing it for analysts. We're writing it for shareholders, and we're trying to tell them something so they can make a — they can not only get the picture as to what we own now, but how we think about the operation, what we're trying to do over time. And we try to do the best job we can every year.

And I don't think it — I think if somebody is terribly interested in the details, they really are missing the whole picture. Because you could have known every detail of our textile business in 1965, and we could give you the information as to how much we made from linings and how much we made from handkerchiefs, and you'd be in a different world. I mean, the important thing was how we looked at running money and what we would do about things over time.

And it just — you could have gotten very misled — if you'd read it in 1980 or '85 and you looked for great detail on how See's candy was doing because they moved eastward, you know, we'll tell you that overall that failed, in terms of moving out the territory.

But going into a whole lot of detail that might be very interesting to an analyst, but really for the shareholder, they've got to make a decision as to who's running their money, and how they're running it, and what they've done over time, and what they hope to do in the future, and how to measure that. And again, we're writing it for the individual. Charlie?

CHARLIE MUNGER: Well, I suppose I should be watching every tiny little business down to the last nickel, but I don't. And I don't want that much detail. And I think our competitors would like it, and it wouldn't do our shareholders any good. So, we'll probably just keep reporting the way we do.

WARREN BUFFETT: You can see how flexible we are here. (Laughter)

17. Munger: "Climate getting better" for U.S. investments in China

WARREN BUFFETT: Station 3.

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. I'm Sasha Xixi (PH) from China International Capital Corporation Limited.

Last week, China announced 12 new measures further opening up the financial industry. All these measures will allow more invested institutions to enter into Chinese financial market, and to insure the policies of foreign investment to be consistent with those of domestic investment.

What do you think about these new measures? Do you believe the foreign financial institutions will have more pricing power over the Chinese stock markets in the future? Do you have any plans to set up a company in China? If so, what time? Thank you.

CHARLIE MUNGER: Well, we've got one now. Dairy Queen is all over China. (Laughter)

And it's working fine. And we didn't wait for new laws. We did it under the old laws. But we're not that big, net, in China, right, Warren?

WARREN BUFFETT: We're not that big what?

CHARLIE MUNGER: In China.

WARREN BUFFETT: No, but we had something, you know, that could have happened that would have been quite sizable.

But China, it's a big market, and we like big markets. I mean, we really can only deploy capital in a major way maybe in 15 or so countries just because of the size.

CHARLIE MUNGER: But generally, I think the climate is getting better. It really makes sense for the two countries to get along. Think of how stupid it would be if China and the United States didn't get along. Stupid on both sides, I might add.

WARREN BUFFETT: Yeah. We've done well in China. We haven't done enough, but —
(Applause)

18. Buffett has “feeling” Brexit vote was a mistake, but he’s still anxious for a U.K. deal

WARREN BUFFETT: Andrew?

ANDREW ROSS SORKIN: Warren, this is a question from a member of the House of Lords in Westminster, who happens to be here today, who also is a shareholder of the company.

This is Lord (Jitesh) Gadhia who says, “You've written, ‘We hope to invest significant sums across borders. So, what's your appetite to invest in the U.K. and Europe, and how will Brexit impact that? And while we're at it, what's your advice for solving U.K.'s Brexit dilemma?’”
(Laughter)

CHARLIE MUNGER: That's yours, Warren. (Laughter)

WARREN BUFFETT: Well, I can — I will tell you this. I mean, I gave an interview to The Financial Times, and I don't do that very often.

But one of the considerations I have is that I would like to see Berkshire Hathaway better known in both the U.K. and Europe. And the FT audience was an audience that I hoped would think of Berkshire more often in terms of when businesses are for sale.

Our name is familiar, I think, pretty much around the world in, at least, financial circles. But there is no question if anybody's going to sell a large business in the United States, they're

going to think of Berkshire. They may decide, for other reasons, they'd rather do it differently. But they will think of Berkshire.

And I don't think — I mean, obviously that is not as true around the world. We've had some very good luck with a few people that have thought of Berkshire, I mean, such as at ISCAR. And actually, Berkshire Hathaway Energy had one of its base holdings from way back was in the U.K.

But I was looking, in doing that interview, I was willing to spend three hours with the FT reporters in the hope that when they write about — when they write the story — that somebody, someplace thinks of Berkshire that wouldn't otherwise think of it.

And we'd love to put more money into the U.K. I mean, if I get a call tomorrow and somebody says, you know, "I've got an X-billion-dollar — pound — company that I think might make sense for you to own," and that I would like to actually have as part of Berkshire, you know, I'll get on the plane and be over there.

But they'll have to name — they'll have to tell me what their price ideas are, and what its earnings — I'm not interested in going over and talking about it and pricing it for them and not making a deal. We like to make deals when we actually get into action. And we're hoping for it.

And we're hoping for a deal in the U.K., and/or in Europe, no matter how Brexit comes out.

I think it — I don't — I'm not an Englishman, but I have the feeling it was a mistake to vote to leave. But I don't think it's — I don't think it — it doesn't destroy my appetite in the least for making a very large acquisition in the U.K. Charlie?

CHARLIE MUNGER: Well, all my ancestors came from northern Europe so I'm very partial to the place. On the other hand, if you asked me how I would vote on Brexit if I lived in Britain, I don't even know. It just strikes me as a horrible problem. And I'm glad it's theirs, not mine. (Laughter)

WARREN BUFFETT: But if I called you tomorrow and said we had a deal in U.K., you'd tell me —

CHARLIE MUNGER: Oh, I would go in, in a minute.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Those are my kind of people. I understand them.

WARREN BUFFETT: Yeah. (Laughter)

19. We don't need "boots on the ground" to find foreign acquisitions, we need lower prices

WARREN BUFFETT: OK, Gregg. (Laughter)

GREGG WARREN: Yeah, Warren, just wanted to kind of maybe follow up on those past two questions, because there is sort of a theme there.

It seems to me that there's definitely more of a home country bias when we look at the acquisitions and investments that Berkshire's done historically.

And while there's definitely value in sticking with what you know and feel the most comfortable with, it seems like you've gone from a model that was originally focused on putting boots on the ground to find investment and acquisition opportunities to one where you're seemingly more content to have sellers or their representatives call you or drop by the office, basically more of a pull model than a push model.

There's nothing wrong with this, but I just wonder, if the opportunity cost that comes with this type of model is that Berkshire misses out on a lot of overseas business where owners are unaware of your willingness to step up and buy them outright and allow them to run their companies under the Berkshire umbrella, and missing stock investment opportunities because Berkshire is not necessarily familiar enough with the local market.

At this point, do you think Berkshire would benefit from putting more boots on the ground in these overseas markets?

WARREN BUFFETT: Yeah, we — actually, it must have been after we bought ISCAR, Eitan Wertheimer convinced me that we should get more exposure in Europe. And he helped out in doing that.

I went over, he arranged various meetings. We've had a lot of contact. It isn't that they're not aware, and we do hear about some.

But we do have the problem they've got to be sizable. I mean, if we do a billion-dollar acquisition, and it makes \$100 million, or thereabouts, pretax, \$80 million after tax, you know, it's — if we really know the business and we're sure we're not going to have a problem with the people running it being motivated in the future, and doing a similar job as to when they had their money in and everything, it's nice to add 80 million to 25 billion.

But you can't afford to spend lots of time doing that. And we gain something by having Todd (Combs) and Ted (Weschler) do some looking at things, screening them and that sort of thing.

But in the end, you want somebody that — you want some family that's held their business in Europe or in the U.K. for 50 or 100 years that can make a deal, and that wants to do it with Berkshire.

I mean, if they're looking to get the most money, if they want to have an auction, we're not going to win and we're not going to participate because we're not going to waste our time on it.

If we form an acquisition crew, they'll acquire something. I mean, I've watched so many institutions in operation that, you know, if your job every day is to go to work and screen a bunch of things with the idea that you're the strategic department or acquisition department, you're going to want to do something. I want to do something, but I don't want to do something unless — (laughs) — Berkshire benefits by it — truly benefits by it — and generally it's of a size.

CHARLIE MUNGER: Warren, our problem is not a lack of boots on the ground, our problem is the people on the ground are paying prices that we don't want to pay.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: That's our problem. And that problem is not going to be cured by boots.

WARREN BUFFETT: We can spend \$100 billion in the next year. That is not a problem.

CHARLIE MUNGER: No.

WARREN BUFFETT: Spending it intelligently is a huge problem. And the —

CHARLIE MUNGER: Our competitors are buying with somebody else's money, and they get part of the upside and take none of the downside.

WARREN BUFFETT: And a lot of them —

CHARLIE MUNGER: It is hard to compete with people like that.

WARREN BUFFETT: Yeah. They'll leverage it up, they'll make a lot of money if it fails, and they'll make even more money if it succeeds. And that's not our equation.

CHARLIE MUNGER: No.

WARREN BUFFETT: And that isn't always that way, but it's certainly that way now. It's probably —

CHARLIE MUNGER: And it's not in the shareholders' interest that we get to be like everybody else.

WARREN BUFFETT: Yeah. (Applause)

20. We feel good about Berkshire as a long-term “compounding machine”

WARREN BUFFETT: OK, station 4.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, thank you so much for the wisdom you've shared with us over the years. This is Steven Wood from New York. And, Mr. Buffett, thank you very much for your feedback, your very generous feedback, last August on the book that I'm writing.

I just had one follow-up, if I may. In studying the most significant value creators of all time, it is very evident that the major compounding effect happened later — at the later stages of the careers. Or, in (Cornelius) Vanderbilt's case, even beyond his own career.

So, your recent investments have suggested to me that you are designing Berkshire to be a steady compounding machine that should continue to create value for a very long time.

Would you both please elaborate on this compounding machine? And the machine's ability to continue to adapt to keep this value creation durable. And then is this legacy one of your sort of primary motivations when you wake up every day?

WARREN BUFFETT: I would say it is the primary motivation, but it's been that for a very, very, very long time.

No matter what was going right in my life, if things were going badly at Berkshire, I would not feel good, you know. I don't need to be spending my time working on something — (laughs) — that makes me feel bad about the results when we get through.

And it's something that's doable. I mean, the culture is stronger now than it was 10 years ago, and it was stronger then than 10 years previously. It moves slowly, but it goes in the right direction.

And when we get chances to deploy the capital, we've always tried to make any entity, whether it was the partnership originally, or Berkshire now, or Blue Chip Stamps when we owned it, or even Diversified (inaudible), we wanted them all to be compounding, in effect, be compounding machines.

That's why people gave us capital. That's why we put our own capital in. And if we failed at it, we really felt like we'd failed. It didn't make any difference how much money we made from fees or anything like that, we knew what our yardstick was.

And so that will continue. I think Berkshire is better situated than it's ever been, except for the fact that size is a drag on performance, and I probably wrote that 40 years — well, I wrote it, actually, when I closed the partnership to new money when we had like \$40 million in it.

I just said, really, that new — that additional capital would drag down returns from a \$40 million base. So, you can imagine how I feel with a \$368 billion — (laughs) — base of capital in Berkshire now.

But this culture is special. It can work. It won't be the highest compounder, by a long shot, against many other businesses. I think it will be one of the safest ways to make decent money over time. But that will depend on the people that follow us. Charlie?

CHARLIE MUNGER: Well, we came a long way from very small beginnings. And the fact that it slows down a little when it becomes monstrous is not my idea of a huge tragedy. And I think we will continue to do very well in the future.

We had nothing like the energy operation, you know, 20 years ago, and it's a powerhouse. We had nothing like Kevin's (Clayton) operation in home building 30 years ago, and it will soon be the biggest — well, even now, it's bigger than anybody else in the country, you know, both of types of housing. Isn't it — houses? I think so.

And we have a lot going for us, and I'm satisfied. I think it's going to continue reasonably.

WARREN BUFFETT: And it would ruin our life if we did terribly. (Laughs)

So, that's what we wake up thinking about in the morning. But I wouldn't want to be in a business where I was going to let down other people, and I think it would be crazy to do something like that, even if you weren't rich and 88. (Laughs)

But we are motivated to have something that is regarded as something different than others, and we're actually — in a world where so much money is institutionalized, you know, I like the idea of having something that's actually owned by individuals in very significant part, who basically trust us and, you know, don't worry about what the next quarter's earnings are going to be. I think it's different than much of capitalism, and I think it's something that Charlie and I feel good about. Isn't it, Charlie?

CHARLIE MUNGER: Yeah, absolutely. (Applause)

21. Berkshire vs the S&P, with taxes thrown in

WARREN BUFFETT: Carol?

CAROL LOOMIS: This question comes from Stephen De Bode of Danville, California, and it raises a question I've certainly never heard before.

"Mr. Buffett, in the past, you have recommended low-cost S&P — and again today — the S&P 500 Index funds as reliable, long-term investment vehicles. These funds have certain inherent structural advantages such as low costs, and automatic reshuffling of their holding.

"But Berkshire also has certain structural advantages, such as financial leverage from the float, and diverse capital allocation opportunities. I think of Berkshire as being ahead in this game.

“For example, it seems to me that if Berkshire’s overall operating business and investment performance were to exactly match the total return of the S&P Index over a 10-year period, Berkshire’s growth in intrinsic value would outperform the S&P 500.

“If you agree, could you estimate by how many percentage points?”

WARREN BUFFETT: (Laughs) Well, the answer is, I won’t estimate anything. But the — if we just owned stocks, and we owned the S&P, our performance would be significantly worse than the S&P because we would be incurring a corporate tax, which would now be 21 percent on capital gains, plus possibly some state income taxes. And effectively, our tax rate on dividends is — depends where they’re held — but somewhere between 10 1/2 or 11 and 13 percent.

So, Berkshire is a mistake — or it’s at a corporate disadvantage simply by the way the tax law runs, compared to owning an index fund, which has no tax at the corporate level, but just passes through to shareholders.

So, I wouldn’t — I don’t know whether we’ll outperform the S&P 500 or not. I know that we’ll behave with our shareholders’ money exactly as we would behave with our own money.

And we will have — we’ll basically tie our fortunes in life to this business, and we will be very cognizant of doing anything that can destroy value in any significant way. But we will probably —

If there were to be a very strong bull market from this point forward, we would probably underperform during that period. If the market five years from now or 10 years from now is at this level or below, we will probably overperform.

But I don’t think that I want to — I don’t quite understand the question in terms of when it said the total return of the S&P over a 10-year period and Berkshire’s growth in intrinsic value would outperform. I don’t know whether that will happen or not. Charlie?

CHARLIE MUNGER: Well, there would be one big advantage for the shareholders that pay taxes, and that is that the Berkshire shareholders, even if we just matched the S&P, we’d be way ahead after taxes. We all have a pretty decent role in life and a pretty good position. We shouldn’t be too disappointed.

WARREN BUFFETT: No. If we — we could have structured — going back to partnership days — we could have structured things so that actually, over a period of time, doing the same things we did, would have actually come out somewhat more favorably for shareholders if we had kept it to the original partnership group.

But the present form hasn’t worked badly, although we have had periods when our corporate capital gains tax, as opposed to the individual, I think it got up to 39 percent a couple of years

or one year, and certainly was 35 percent for a long time. And then, on top of that, we had the state income taxes in some cases.

And they exceeded — well, I mean, if you owned a pass-through fund, you did not have that level of possible double taxation. Now, if you hold your stock forever, you don't pay it. But if you actually sell your stock, you've had a double tax effect.

We're not complaining in any way, shape, or form. This country has treated us incredibly well, and we've added this huge tailwind, which I wrote about in the annual report. And it wouldn't have happened in any other country.

So, we've been very lucky that we've been operating in this country at this time. Charlie, anything?

CHARLIE MUNGER: No.

22. How NV Energy is working to recover from casino defections

WARREN BUFFETT: Jonathan?

JONATHAN BRANDT: In Nevada, several casinos have cut the cord with our NV Energy subsidiary and are seeking their electricity needs elsewhere, even though they had to pay huge exit fees. I have three questions about this phenomenon.

One: do you believe that these are rational choices, or were they made for non-economic reasons?

Two: what can NVD do, if anything, to stem the tide of defections?

And, three: is this something that could happen in other states where you operate regulated utilities? Or is the situation in Nevada somehow unique because of super-sized customers that have more leverage in the power market than smaller industrial customers in other states?

And I don't know whether that's a question for you or Greg, but I'd be happy to hear from either of you.

WARREN BUFFETT: It's a question for Greg. (Laughter)

GREG ABEL: Thanks, Jonathan. So just for everybody, I think they heard the question from Jonathan, but we've owned the utility there for approximately five years.

When we inherited the utility, we knew it had some fundamental issues around its customers. The relationships were really strained from day one because they'd had a history of continuing

to increase rates, and they really weren't delivering renewable energy or meeting the customers' needs or expectations. So, we knew we had some challenges there.

As we sit here today, we've had five customers leave our system. Those customers still use our distribution services. So, the only thing we do not provide them is the power. So, we have lost an opportunity to sell them power, and we've lost the associated margin on that. And we are disappointed with that. We do recover, you know, substantial fees, as you noted.

How the commission looked at it was, "Well, you lose this customer; we'll give you effectively six years of profit on that. And by then, you should have grown back into your normal load." And actually, it's a fair outcome. Our load is higher than it was relative to when those customers have left. So, we've grown through that, and it's consistent with their belief.

The fundamental issue, and you've touched on it, why are they leaving? There are economic reasons for them leaving. And the fundamental reason is, in year seven, they no longer bear sort of the societal costs that are being imposed by the state. They don't have to bear the costs of renewable energy. They don't bear the costs of energy efficiency. And they viewed it as sort of the time to exit out of that model.

We do have a variety of legislation that's going to levelize the playing field. We've had a number of customers that announced they were leaving now who've entered into long-term agreements with NV Energy. And I really do believe our team has the right model, which is we're much more focused on delivering a great value proposition to our customers. So, it has to include price.

But equally, we're building substantial renewable energy there now. And long term, our team will deliver a great proposition to them, and I think NV Energy will prosper in the long term. We're going to be happy with it as a long-term investment. Thank you.

WARREN BUFFETT: Greg, could you give them, give the audience a rough approximation of what, say, in the 10 years or whatever it may be before we bought Nevada Power, what had happened with rates; what had happened with rates under us; and what has happened with coal generation under us?

GREG: Right. Yeah. Yeah, that's great. So, you know, Warren's really expanding on what are — the focus we've brought to delivering something to the customer.

So, if you'd looked at the prior ten years, they pretty much had a rate strategy that, every second year, their rates would go up sort of by the cost of inflation. And that pretty much materialized year after year.

We came in immediately, just like we've done in Iowa — so we've built all that renewable in Iowa, and we've never increased rates since the date we acquired it, 1999. So, rates have been stable, and we don't ever see raising rates in Iowa till probably 2030 or 2031.

Our team took a very similar approach in Nevada, which was to, you know, stabilize it. So, rates are down probably 5-7 percent since we've owned them. So, we haven't had rate increases.

We've announced substantial rate increases (decreases) again that will take effect every two years. So just like we used to be able to have rate increases, we have a few of when we'll decrease their rates. Their rates will go down again in 2002. We've — pardon me, in two years.

And then on top of that, there's been an approach to eliminate coal, as Warren touched on. So fundamentally, when we acquired it, all their coal fleet was operating. We've retired a substantial portion of the coal fleet already. And by, I believe it's within a year of this, 2023, we'll have eliminated 100 percent of their use of coal in that state. And it was a substantial portion of their portfolio in the past. So — (applause) — team's done a great job. Thank you.

WARREN BUFFETT: Charlie, have anything?

CHARLIE MUNGER: No.

23. Portfolio managers Weschler and Combs roughly matching the S&P but making other contributions

WARREN BUFFETT: Station 5.

AUDIENCE MEMBER: Yes, hi. My name is Aaron Lanni. I'm a portfolio manager at a company called Medici out of Montreal, Quebec.

My question is actually for Todd (Combs) and Ted (Weschler), if possible.

So according to Warren, you lagged slightly behind the S&P 500 since joining Berkshire. So what recent changes, if any, have you implemented to increase your odds of beating the S&P in your respective stock portfolios over the next 10 years?

WARREN BUFFETT: Yeah, I'm not sure whether Todd or Ted are here, but they — I will tell you, but then — I'll make this the final report on it.

But on March 31st, actually, one is modest ahead, one is modestly behind. But they are extraordinary managers. It has not been — it was a tough — it's been a tough period to beat the S&P and, like I say, one of them is now ahead of the S&P over that period, one's modestly behind.

They've also helped us in just all kinds of ways. What Todd has done in connection with the medical initiative, we have — with J.P. Morgan, Amazon, I mean, I don't know how many hours a week he's worked totally on that. The things they've brought to me, what Ted did in terms of the Home Capital Group where we have essentially, in a major way — well, we stabilized a

financial institution that was under attack and experiencing runs in Canada. And he did the whole thing.

I heard about that on a Monday, and on Wednesday, we put an offer before the company. And previously to that, they probably had dozens and dozens of people combing over them and, meanwhile, they were struggling. And, you know, it was remarkable what he did and I think it's appreciated in the Toronto area.

So, we are enormously better off because the two are with us. And while we have that measurement, like I say, I'll just put it this way, they're doing better than I am anyway. So, if you ask me to report on them all the time, I'll have to report and myself all the time, and I'm not — (laughs) — that would be embarrassing compared to how they do. They do better.

They're very, very smart. They've been smart with their own money over the years. They've been smart in running other people's money over the years. And they've made us a lot of money, but they made it during a market where you'd have made a lot of money in S&P as well. Charlie?

CHARLIE MUNGER: No, I'm fine.

24. Power of American Express's brand will help fend off heavy credit card competition

WARREN BUFFETT: OK. Becky?

BECKY QUICK: This question comes from Leiders Luff (PH), Yosis Luff (PH), and Dan Gorfung (PH) of Israel. And they write to both Mr. Buffett and Mr. Munger, "Do you think that AmEx's share of mind is enough to win the credit cards race? How do you see AmEx's competitive position now compared to the past? And who is the most threatening competitor now, compared to the past?"

WARREN BUFFETT: Yeah, everybody's a competitor, including now Apple. It has just instituted a card, I guess, in conjunction with Goldman Sachs.

Everybody — there will always be, in my view, many, many competitors in the business. Banks can't afford to leave the field. It's a growing field. They build up receivables on it.

But I wouldn't think of the credit card business as a one-model business any more than I would think of the car business as essentially being one model. I mean, Ferrari is going to make a lot of money, but they're going to have just a portion of the market.

Well, AmEx is growing around the world with individuals, it's growing around the world with small businesses. You just saw the contract they made with Delta — which is probably the ideal partner— that runs, what, for eight or nine, whatever it may be, nine or 10 years, actually.

You know, the billings go up per capita, they go up — the coverage spreads. And they're going to have loads of competition, and they always will. But they had — you know, that's something — J.P. Morgan, you know, took on the Platinum Card. It was a competitor, and the Platinum Card had the highest renewal rates that they've had. And they increased the price I think from 450 to \$550 during a competitive battle, and retention improved, and new business improved, and 68 percent or so of the new business was millennials.

I mean, it is a — it is not an identical product with anything else. And as a premium card, it has a clientele which is large. It may only be — it may be X percent of the market, it may be three-quarters of X percent, or whatever it may be. It isn't for the person that likes to have five cards and look every day at which one provides the most rewards that day or in what gas stations or something of the sort.

But it's got a very large constituency that has a renewal rate, a usage rate, that's the envy of everybody else in the industry. So, I like our American Express position very well. Charlie?

Charlie, anything on American Express?

CHARLIE MUNGER: No. (Laughter) No, I think we own the world as long as the technology stays the same.

WARREN BUFFETT: No, we — it's an interesting thing.

CHARLIE MUNGER: I have no opinion about technology.

WARREN BUFFETT: This year — (laughter) — the technology is not the whole thing. I mean, you know, fortunately. I mean, it —

If you look at credit card usage, there are a lot of different things motivating different people to use different various types of payment systems. And there's a lot of them that are growing. There are some of them that are marginal. And American Express is an extraordinary operation.

And I think this year, our share of the earnings — well, by next year, our share of the earnings of American Express will be equal to the cost of our position. We'll be earning a hundred percent on what that position cost us, and I think it will grow.

And I think the number of shares will go down and our interest will go up without us laying out a dime. So, it's —

CHARLIE MUNGER: As you say, we own the world if it doesn't change.

WARREN BUFFETT: Well, even if it changes some. The world has changed a lot. American Express was formed in 1850.

CHARLIE MUNGER: No, I'm talking about WeChat.

WARREN BUFFETT: You can talk about all kinds of competitors, but —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: But the — American Express actually was an express company, formed in 1850, like I say, by Wells and Fargo, of all people. And, you know, for a while they carried these big trunks around of valuables. And then the railroads came along and that wasn't going to work very well anymore, so they went into traveler's checks.

And it's a very interesting thing. In 1950, when I was living at 116th and Broadway, they were down at 65 Broadway, and they were the most important name in travel. They were synonymous with the integrity of their traveler's checks. And the whole company, in a record year for travel, earned \$3 million. \$3 million. What a bond trader earns now in my lifetime, that's what they've done with — and their hand going in was the traveler's check, which has more or less disappeared.

But American Express, the power of that brand, intelligently used, going into the credit card business, where they entered much later than the Diners Club, later than Carte Blanche, but they came to dominate the luxury end of the credit card business.

It's a fantastic story, and I'm glad we own 18 percent of it.

25. Occidental came to us for a \$10B loan because we could do it quickly

WARREN BUFFETT: OK, Jay?

JAY GELB: Actually, I'm going to ask something about Occidental Petroleum. I'm surprised it hasn't been asked yet.

So, Berkshire has committed to providing \$10 billion in financing in the form of an 8 percent preferred share and attached warrants for Occidental's proposed acquisition of Anadarko.

This is the first time Berkshire has committed to such a large preferred share investment since the acquisition of Heinz in 2013.

What did you find attractive about the Occidental deal, in terms of its business? And should we expect other large financing transactions in the future, as a way for Berkshire to deploy a portion of its excess cash?

WARREN BUFFETT: I don't think the Occidental transaction will be the last one we do. (Laughs)

There may be one, you know, in a month. They may be one three or four years from now. It won't be identical. I hope it's larger.

But the point is, we're very likely to get the call because we can do something that really I don't think — no institution can do it. I mean, they've got committees that have to pass on it, and they want to have so-called MAC clauses, Material Adverse Changes. They want to do this and that.

And if somebody wants a lot of certain money for a deal, you know, they've seen that I can get a call on Friday afternoon, and they can make a date with me on Saturday, and on Sunday, it's done. And they absolutely know that they have \$10 billion and we're not going to tell them how to structure their transaction or do anything else. They've got it.

And there will be times in the future when something, not identical, but similar, comes along, and we're the one to call. And I hope its larger than 10 billion. But —

It could be — it could be we'll do — you know, in the next five years. It could be we'll do a lot of money, additional money in things similar to this, not identical. And it could be that nothing will happen.

But if there are any \$10 billion, or \$20 billion, or maybe even \$50 billion two-day transactions, if there are any in the world, believe me, they'll think of Berkshire Hathaway for sure in terms of what number to call. Charlie?

CHARLIE MUNGER: Well, I like it. (Laughter)

WARREN BUFFETT: I called Charlie as soon as we made the — I called Ron Olson first because I was worried that he might have a conflict. And in about ten minutes, he had — I told him we — it had to be done by Monday night. And Cravath was being told the same thing by Occidental.

And it was very late on Monday night, but all the papers were put in order. And Munger, Tolles was in Los Angeles, and Cravath was in New York, and I was in Omaha. And I didn't do that much; Mark Hamburg did a lot of the work. He was at work on Sunday on other things when I went down (laughs) to meet with the Occidental people.

And it was the product of people who understood us, understood how we operate, and both with an incentive to put all the manpower necessary on the job.

And like I say, I think their board of directors met at 10 o'clock on Monday night to approve it. But they could announce it Tuesday morning, and that's what they wanted to do. And with Berkshire, they could do it.

26. We have no formula for assessing risk

WARREN BUFFETT: OK, station 6.

AUDIENCE MEMBER: Good afternoon, my name's Tony McCall and I'm from Montgomery, Alabama. And my question is about your disciplined risk evaluation approach and how you balance that with the fact that perseverance and determination and grit are often necessary for success.

WARREN BUFFETT: Well, I'm not — I certainly like determination and grit in the — with the people we work for.

But we don't have any formula that evaluates risk, but we certainly make our own calculation of risk versus reward in every transaction we do.

And that's true whether it's marketable securities, that's true whether it's private investments, that's true whether it's making an investment in a business.

And sometimes we're wrong, and we're going to be wrong sometimes in the future. You can't make a lot of decisions in this business without being wrong. But we don't think the procedure — or the results — would be changed favorably by having lots of committees and lots of spreadsheets and that sort of thing. It just — you know —

If I had a group under me, they would try and figure out what I wanted the answer to be, and they would tell me what I wanted to hear.

And I've watched that approach at 20 public companies. And what the CEO wants to do, they may spend a lot of time getting there, but the investment banker gets there, and the internal committees get there, — or the internal operations — get there.

The calculations are — it's the same as the insurance business with Ajit (Jain). Ajit gets calls on insurance deals, and you have to think through that deal.

The main thing is you have — are you reasonably sure that you know what you're doing? And if it gets past that hurdle, then we go on to figure out the math of gain versus loss and how much loss we can afford to take in anything. And we're willing to take what sounds like large losses if we think that the rewards are more likely and proportional. Charlie?

CHARLIE MUNGER: I've got nothing.

WARREN BUFFETT: It's very disappointing — we have no formulas around Berkshire. We don't sit down and write a bunch, you know — have people work till midnight calculating things and putting spreadsheets together.

And if the hurdle rate is 15 percent or something, having them all come out at 15.1 or 15.2, because that's what's going to happen. I mean, you're going to get the numbers you want to hear and to an extreme degree.

27. Buffett describes some of the dishonest business propositions it gets

WARREN BUFFETT: The proposals we see from the investment world — I've got to tell you about one because it illustrates what goes on.

We received a proposition the other day — and I'll disguise the numbers a little bit so somebody can pick it out — but it was a private company, and we'll say it was earning a hundred million dollars a year. But the seller of the business and the investment banker suggested that we should look at the earnings as being 110 million dollars a year, because as a private company they had to pay their top people in cash, which was expensed.

But we could pay them in stock options and things like that, which weren't expensed, or were explained as not really counting and therefore we could report 110 million dollars if we gave away something we didn't want to give away.

But by essentially — by sort of lying about our accounting, we could add 10 million dollars in earnings, and they wanted us to pay them because they couldn't do it and we could do it. And therefore — at this point, they're losing me of course, totally.

But it — it's just astounding the accounting games that are played. All the adjustments are why the place should really be — will be — earning more than before. It's a business.

We also had one that came in from a private equity firm and by a mistake we got the email that was sent to the manager from the email from the private equity firm that owned it, to the manager, in terms of making projections for it.

And they told them to add 15 percent because they said Buffett will discount it by 15 percent or 20 percent anyway. (Laughs)

So just add 15 percent to offset his conservatism. You know, it's not an elegant business, as Charlie will tell you. (Laughter)

You have any better stories, Charlie? (Laughter)

CHARLIE MUNGER: It's bad enough.

WARREN BUFFETT: OK, Andrew —

CHARLIE MUNGER: It's really very bad enough.

ANDREW ROSS SORKIN: Thank you, Warren. I think it's —

CHARLIE MUNGER: Why do we want our leading citizens lying and cheating?

28. Buffett would bet against a car company like Tesla being able to compete on auto insurance

WARREN BUFFETT: Andrew?

ANDREW: I believe it's my final question and admittedly it's a two-parter, but it's the same topic.

Elon Musk says that Tesla will start to offer insurance for its cars and can price it better than a typical insurance company because of the data it collects from all of the vehicles on the road.

You've talked about the threat of autonomous vehicles on the insurance business. But what about to GEICO of automobile themselves getting into the insurance business?

And on a very similar topic, Tesla recently announced that they are shifting to an online-only sales model. And several traditional auto dealerships are also reducing their property holdings as car buyers increasingly use smart phones and the internet to shop for cars. What does this portend for Berkshire Hathaway Automotive?

WARREN BUFFETT: Yeah. Actually, General Motors had a company for a long time called Motors Insurance Company and various companies have tried it.

I would say that the success of the auto companies getting insurance business are probably about as likely as the success of the insurance companies getting into the auto business.
(Laughter)

I worry much more about Progressive than all of the auto company possibilities that I can see, in terms of getting insurance business. It's not an easy business at all.

And I would bet against any company in the auto business being any kind of an unusual success.

The idea of using telematics, in terms of studying people's drivers habits, that's spreading quite widely. And it is important to have data on how people drive, how hard they break, how much they swerve, all kinds of things.

So, I don't doubt the value of the data but I don't think that the — the auto companies will have any advantage to that. I don't think they'll make money in the insurance business.

Using the internet to shop for cars is like, you know, using the internet for shopping for everything. It's another competitor. And there's no question that people will look for better ways.

The gross margin on new cars is about 6 percent or thereabouts. So, there's not lots of room in the game. But that will be a method and that will sell some cars.

And if there are, you know — it's another competitor. But I don't think it destroys the auto dealer who takes good care of the customers and is there to service the customers.

It's not an overwhelming threat, but it's obviously something that's going to be around and will sell some cars. Charlie?

CHARLIE MUNGER: Again, nothing. (Laughter)

29. Buffett: I'm betting all my wealth on the survival of Berkshire's culture

WARREN BUFFETT: OK. Gregg?

GREGG WARREN: Warren, a lot of Berkshire's success over the years has come from the fact that you and Charlie have had the luxury of being patient, waiting for the right opportunities to come along to put excess capital to work, even if it has led to a buildup of large amounts of cash on the balance sheet.

This has historically worked out well for shareholders, as you and Charlie have been able to take full advantage of the disruptions in equity and credit markets or special situations like we saw with the Oxy deal, to negotiate deals on terms that ultimately benefit Berkshire shareholders.

That said, there is an opportunity cost attached to your decision to hold onto so much cash, one that investors have been willing to bear, primarily by forgoing a return of excess capital, dividends, and share repurchases, as well as seeing lower returns on cash holdings.

As we look forward, how certain can we be that this will still be the case once you're no longer running the show, especially if Berkshire's returns are expected to be lower over time. And is it not more likely that the next managers at Berkshire will have to manage the eventual migration of Berkshire from an acquisition and investment platform to a returning capital to shareholders vehicle?

WARREN BUFFETT: Yeah. Well, that's certainly a possibility. I mean, that's a possibility under me. It's a possibility under the successor. I mean, it's a question of can you invest truly large sums reasonably well. You can't do it as well as you can do small sums. There's no question about that.

But we will have to see how that works out over many years because certain years lots of opportunities, huge opportunities, present themselves and other years there are totally dry holes.

So that's not a judgment you can make in a one-year period or a three-year period. It's certainly a judgment you can make over time though.

And I personally — my estate will have basically nothing but Berkshire in it for some time as it gets disbursed to philanthropies. And I have a section in there which says to the trustees, in effect, to manage it — I have a section in there that says — ignore the — your exempt, from my standpoint, from the law that trustees normally should diversify and do all that sort of thing.

And I want the entire amount that they have to be kept in Berkshire as they distribute it over time to the philanthropies. And I don't worry at all about the fact — I would like to have a very large sum go to the philanthropies, and I don't worry at about the fact that it essentially will all be in Berkshire. And I'm willing to make that decision while I'm alive, which will continue for some years after I die.

So, I have a lot of confidence in the ability of the Berkshire culture to endure and that we have the right people to make sure that that happens. I'm betting my entire net worth on that. And that doesn't give me pause at all.

I rewrite my will every few years, and write it the same way in respect to the Berkshire holdings. Charlie?

CHARLIE MUNGER: I don't own any indexes. And I have always been willing to own just two or three stocks. And I have not minded that everybody who teaches finance in law school and business school teaches that what I'm doing is wrong. It isn't wrong. It's worked beautifully.

I don't think you need a portfolio of 50 stocks if you know what you're doing. And I hope my heirs will just sit.

WARREN BUFFETT: My heirs hope that I'll change my will. (Laughter)

30. "Having the right partners in life is enormously important"

WARREN BUFFETT: OK, station 7.

AUDIENCE MEMBER: Hi. Good afternoon, Mr. Buffett and Mr. Munger. My name is Bill He (PH), and I'm from Vancouver, Canada. You two make up an iconic duo. And growing up, I found your investment strategies very admirable. And so, my question is, how do you deal with conflicts when they arise between the two of you?

WARREN BUFFETT: Are you applying personal conflicts in terms of doing something ourselves versus having Berkshire, do it? Or — oh, between the two of you. I'm just in —

Charlie and I literally, and people find this hard to believe, but in 60 years we've never had an argument. We have disagreed about things and we'll probably keep occasionally disagreeing about this or that.

But if you define an argument as something where emotion starts entering into it, or anger or anything of the sort, it just doesn't happen.

I think that Charlie is smarter than I am, but I also think that there are certain things where I've spent more on them than he has. And sometimes we both think we're right. And generally, I get my way because Charlie is willing to do it that way and he's never second-guessed me when things have been wrong. And I wouldn't dream of second-guessing him if he were doing something that was wrong — that turned out to be wrong. We will never have a conflict, basically. Charlie?

CHARLIE MUNGER: Well, the issue isn't how long — how we get along, the issue is how is the company going to work when we're gone? And the answer is fine. It's going to work fine.

WARREN BUFFETT: We're lucky that, you know, I ran into him when I was, what, 28 years old. And — we both worked in the same grocery store and he grew up less than a block away from where I now live and everything. But I did not know who Charlie Munger was — (laughs) — until I was 28.

But clearly, we're in sync in how we see the world. And we're in sync on business decisions, basically.

Charlie would do fewer things than I would, but that's because I'm spending my time on this while he's designing dormitories or something. (Laughter)

And we both keep busy in our own ways. And we have a lot of fun dividing the labor like we do.

But you really want to work — I mean, having the right partners in life, particularly the right spouse, but having the right partners in life is enormously important. I mean, it's more fun with a partner, both in personal life and in business life. And you probably get more accomplished, too.

But you just have a better time. It would not be any fun to do work in a little room and make a ton of money trading around securities but never working with another human being.

So, I recommend finding — well, Charlie gave some advice in the movie, finding the best person that will have you or something like that. (Laughs) Sort of a limited objective.

CHARLIE MUNGER: But it's not hard to be happy if you're a collector and don't run out of money.

Collecting is intrinsically fun. Just think who — how many people who you've known your whole life who were collectors who didn't run out of money, who weren't happy collecting? That's why we've been collecting all our lives.

You know, it's a very interesting thing. There's always a new rock to be turned over. And it's interesting.

WARREN BUFFETT: Yeah. And in a certain way we've collected friends that make our lives better and that we have a good time with. And it's very important, you know, who you select as your heroes or friends. And I've been lucky in this. I mean, it was only because of the doctor named Eddie Davis and his wife that Charlie and I even met.

But if you keep doing enough things, some will work out very lucky. And the best ones are ones that involve lifelong involvement with other people.

We've got some in our directors, a number of our directors, that have had similar impacts on me.

So, I recommend that you look for somebody better than you are and then try to be like they are.

CHARLIE MUNGER: It's funny, you know, we've lost people along the way. And when I lost Warren's secretary I thought, "Oh, my God. She was so wonderful. Gladys (Kaiser). We'll never get another one." Becki (Amick) is better. (Laughter)

And then we had Verne McKenzie, who was a wonderful chief financial officer. He's gone and the current incumbent (Marc Hamburg) is better. We've been very lucky. And maybe the shareholders will be lucky a few more times. (Laughter)

31. Expand you circle of competence if you can, but don't force it

WARREN BUFFETT: OK. Station 8. (Laughter)

AUDIENCE MEMBER: Hi, Warren. Hi, Charlie. My name is Jacob (PH). I'm a shareholder from China and also a proud graduate of Columbia Business School. Thanks for having us here. (Cheers)

My question is, our world is changing at a faster pace today versus 40 years ago and even more so going forward. And in this context, for each of us individually, should we expand our circle of competence continuously over time? Or should we stick with the existing circle but risk having a shrinking investment universe? Thank you.

WARREN BUFFETT: Well, obviously you should, under any conditions, you should expand your circle of competence —

CHARLIE MUNGER: If you can.

WARREN BUFFETT: If you can. Yeah. (Laughter)

And I've expanded mine a little bit over time. But —

CHARLIE MUNGER: If you can't — I'd be pretty cautious.

WARREN BUFFETT: Yeah. You can't force it. You know. If you told me that I had to, you know, become an expert on physics or, you know —

CHARLIE MUNGER: Dance maybe the lead in a ballet, Warren. That would be a sight. (Laughter)

WARREN BUFFETT: Yeah, well. That's one I hadn't really —

CHARLIE MUNGER: (Inaudible) now.

WARREN BUFFETT: That's one you may be thinking about, but I— (laughter) — it hadn't even occurred to me. (Laughter)

But, you know, it's ridiculous. That doesn't mean you can't expand it at all. I mean, I did learn about some things as I've gone along in a few businesses.

In some cases, I've learned that I'm incompetent, which is actually a plus, then you've discarded that one.

But it doesn't really — the world is going to change. And it's going to keep changing. It's changing every day. And that makes it interesting. You know.

And as it changes, certainly within what you think is your present existing circle, you have to — you should be the master of figuring that one out or it really isn't your circle of competence.

And if you get a chance to expand it somewhat as you go along —

I've learned some about the energy business from Walter (Scott) and Greg (Abel) as we've worked together, but I'm not close to their level of competence on it. But I do know more than I used to know. And so, you get a chance to expand it a bit.

Usually, I would think normally your core competence is probably something that sort of fits the way the mind has worked.

Some people have what I call a “money mind.” And they will work well in certain types of money situations.

It isn't so much a question of IQ. The mind is a very strange thing. And people have specialties, whether in chess or bridge. I see it in different people that can do impossible — what seem to me — impossible things. And they're really kind of, as Charlie would say, stupid in other areas — (laughs) — you know.

So just keep working on it. But don't think you have to increase it and therefore start bending the rules. Anything further, Charlie?

CHARLIE MUNGER: No.

32. It's easy to make 50% on a million, but much more difficult on larger amounts

WARREN BUFFETT: Station 9. We're just about — yeah, we got time for a couple more.

AUDIENCE MEMBER: My name is John Dorso (PH), and I'm from New York.

Mr. Buffett, you've said that you could return 50 percent per annum, if you were managing a one-million-dollar portfolio. What type of strategy would you use? Would you invest in cigar butts, i.e., average businesses at very cheap prices? Or would it be some type of arbitrage strategy? Thank you.

WARREN BUFFETT: It might well be the arbitrage strategy, but in a very different, perhaps, way than customary arbitrages, a lot of it.

One way or another, I can assure you, if Charlie was working with a million, or I was working with a million, we would find a way to make that with essentially no risk, not using a lot of leverage or anything of the sort.

But you change the one million to a hundred million and that 50 goes down like a rock.

There are little fringe inefficiencies that people don't spot. And you do get opportunities occasionally to do. But they don't really have any applicability to Berkshire. Charlie?

CHARLIE MUNGER: Well, I agree totally. It's just you used to say that large amounts of money, they develop their own anchors. You're just — it gets harder and harder.

I've just seen genius after genius with a great record and pretty soon they got 30 billion and two floors of young men and away goes the good record. That's just the way it works.

WARREN BUFFETT: When Charlie —

CHARLIE MUNGER: It's hard as the money goes up.

WARREN BUFFETT: When Charlie was a lawyer, initially, I mean, you were developing a couple of real estate projects. I mean, if you really want to make a million dollars — or 50 percent on a million — and you're willing to work at it — that's doable. But it just has no applicability to managing huge sums. Wish it did, but it doesn't.

CHARLIE MUNGER: Yeah. Lee Louley (PH), using nothing but the float on his student loads, had a million dollars, practically, shortly after he graduated as a total scholarship student. He found just a few things to do. And did them.

33. We've tried, but See's Candies gets no traction outside California

WARREN BUFFETT: OK. Station 10.

AUDIENCE MEMBER: Hello, Warren and Charlie. I'm Luis Cobo (PH) from Panama. I'm a proud Berkshire Hathaway shareholder since 10 years ago.

I've been looking at See's Candies, and I'm a pretty good fan of them. And I see Charlie is as well throughout our meeting.

And even with all our consumption — and you know, the company has given us generous profits over the past decades.

Why do you think the company has not grown to the scale of Mars or Hershey's, and what do you think we could do to make this company grow and become a bigger part of our company, being such an amazing product?

WARREN BUFFETT: Well, we've probably had a dozen or so ideas over the years. And we used to really focus on it because it was a much more sizable part of our business. In fact, it was practically our only business aside from insurance.

And like I say, we've had 10 or 12 ideas. Some of them we tried more than once. And as we got a new manager they've tried them. And the truth is none of them really work.

And the business is extraordinarily good in a very small niche. Boxed chocolates are something that everybody likes to receive, or maybe give it as a gift, both sides of it.

And relatively few of the people go out and buy to consume themselves. If I leave a box of chocolates open at the office — we've only got 25 people — but it's gone, you know, almost immediately.

If I take it as a gift to somebody, they're happy to get it. And if you leave the box open at a dinner party again, they're all gone. But those same people that so readily grab it when it's right

there in front of them, do not walk out to a candy store very often and buy it just to eat themselves. They're not going to buy. It's very much a gift product.

It does not grow worldwide. Very interesting thing. People in these — last time I checked, people in the west prefer milk chocolate, people in the east prefer dark chocolate. People in the west like big, chunky pieces. People in the east will take miniatures.

We've tried to move it geographically many, many, many, many times. Because it would be so wonderful if it — when it works it works wonderfully. But it doesn't travel that well.

If we open a store in the east, we get enormous traffic for a while and everybody says, "We've been waiting for you to come." And then it finally — we end up with a store that does X pounds per year when we need one and a half X in the same square footage to make terrific returns.

And we've tried everything because the math is so good when it works. And overall, we have a business that doesn't — chocolate consumption generally doesn't grow that much. But yeah, go ahead Charlie —

CHARLIE MUNGER: Yeah, well, we failed in turning our little candy company into Mars or Hershey's for the same reason that you fail to get the Nobel Prize in physics and achieve immortality. (Laughter)

It's too tough for us. (Laughter)

WARREN BUFFETT: But we put 25 million dollars into it. And it's given us over two billion dollars of pre-tax income, well over two billion. And we've used it to buy other businesses. And if we were the typical company and had bought that business and tried desperately to use all the retained earnings within the candy business I think we'd have fallen on our face.

I think that it just illustrates that all these formulas, you know, you learn or that having a strategic plan to use all the capital or something — some businesses work in a fairly limited area. Others really play out over this —

Dr. Pepper, you know, has — I don't know what the percentage is now, but it might be at 10 or 12 percent market share or something like that in Dallas or maybe it's eight. And then you go to Detroit or Boston and it's less than 1 percent. I'm not sure about the numbers currently.

But you'd think in a mobile society, you know, with Dr. Pepper having been around since the time that Coke was founded in 1886 — it's amazing how certain things travel, certain things don't travel.

You know, candy bars — you mentioned Hershey. I mean, Cadbury doesn't do that well here and Hershey doesn't do that well in the U.K. And here we are, we all look alike. But somehow, we eat different candy bars. It's very interesting to observe.

And the idea that you have some formula for businesses that provide that each one should pursue the course they're on because they made it in X, they should try to find other ways to make it in X. We're quite willing to find it in A, B, C, D, E, or F — the money is fungible.

And I think, actually, it has worked very much to our advantage to have that philosophy. So, anything further, Charlie?

CHARLIE MUNGER: I once told a very great man at dinner after he'd written a very great book, I said, "You know, you're never going to write another great book like that." And he was deeply offended. And I've read his four subsequent books and I'm totally right. (Laughter)

To write one great book is a lot to do in one lifetime. And people aren't holding back on you when they don't do more. It's hard.

WARREN BUFFETT: Yeah. But you ought to make the most of the first one you got. (Laughs)

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: Yeah, you're lucky. You know.

CHARLIE MUNGER: Yes.

WARREN BUFFETT: And we were very fortunate. I would've blown the chance to buy See's Candy, but Charlie said, "Don't be so cheap," basically. And we still got it at a pretty good price. And we learned a lot —

CHARLIE MUNGER: It's amazing how much we've learned over the years.

WARREN BUFFETT: Yeah, we've learned —

CHARLIE MUNGER: And if we hadn't, the record would be so much worse.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: At any given time, what we already knew was not going to be enough to take us to the next step. That's what makes it difficult. Think of all the people you know that have tried to take one extra step and have fallen off a cliff.

WARREN BUFFETT: Well, on that happy note — (laughter) — we will conclude the meeting. (Applause and cheering)

Thank you. Thank you.

Thank you.

Thank you, but save of it for next year. We may need it then.

Just give us a carry-forward on the rest of it, and thank you.

We'll come back at 3:45. We will conduct the business meeting, and it doesn't — we have no — nothing on the proxy to vote on, but we will be back here in 15 minutes.

And if you enjoy a process, you can stick around and watch us reelect our board.

Thank you. Thanks for coming.

34. Formal business meeting and election of board members

WARREN BUFFETT: The meeting will now come to order.

I'm Warren Buffett, chairman of the company and I welcome you to this 2019 — 2019 annual meeting of shareholders.

This morning I introduced the Berkshire Hathaway directors who are present.

Also with us today are partners in the firm of Deloitte and Touche, our auditors.

Jennifer Tselentis is the assistant secretary of Berkshire Hathaway and she will make a written record of the proceedings.

Becki Amick has been appointed inspector of elections at this meeting, and she will certify to the count of votes cast in the election for directors and the motions to be voted upon at this meeting.

The named proxy holders for this meeting are Walter Scott and Marc Hamburg.

Does the assistant secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

Jennifer?

JENNIFER TSELENTIS: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 6, 2019, the record date for this meeting, there were 724,765 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting, and 1,371,697,551 shares of Class B Berkshire Hathaway common stock outstanding, with each vote entitled to 1/10,000th of one vote on motions considered at the meeting.

Of that number 503,181 Class A shares and 839,707,642 Class B shares are represented at this meeting by proxies returned through Thursday evening, May 2nd.

WARREN BUFFETT: Thank you. That number represents a quorum and we will therefore directly proceed with the meeting.

First order of business will be a reading of the minutes of the last meeting of shareholders, and I recognize Mr. Walter Scott, who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second?

RON OLSON: I second the motion.

WARREN BUFFETT: Motion has been moved and seconded. We will vote on the motion by voice vote. All those in favor say aye.

VOICES: Aye.

WARREN BUFFETT: Opposed? The motion's carried.

Next item of business is to elect directors. If a shareholder is present who did not send in a proxy or wishes to withdraw a proxy previously sent in, you may vote in person for the election of directors and other matters to be considered in this meeting.

Please identify yourselves to one of the meeting officials in the aisles so that you can receive a ballot.

I recognize Mr. Walter Scott to place a motion before the meeting with respect to election of directors.

WALTER SCOTT: I move that Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Stephen Burke, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ronald Olson, Walter Scott, and Meryl Witmer be elected as directors.

WARREN BUFFETT: Is there a second?

RON OLSON: I second the motion.

WARREN BUFFETT: It's been moved and seconded that Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Steve Burke, Susan Decker, Bill Gates, David Gottesman, Charlotte

Guyman, Ajit Jain, Tom Murphy, Ron Olson, Walter Scott, and Meryl Witmer be elected as directors.

Are there any other nominations? Or any discussion? The nominations are ready to be acted upon. If there are any shareholders voting in person they should now mark the ballot on the election of directors and deliver that ballot to one of the meeting officials in the aisles.

Miss Amick, when you are ready you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening, cast not less than 543,703 votes for each nominee. That number exceeds a majority of the number of the total votes of all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Steve Burke, Susan Decker, Bill Gates, David Gottesman, Charlotte Guyman, Ajit Jain, Tom Murphy, Ron Olson, Walter Scott, and Meryl Witmer have been elected as directors.

We now — we now have a motion from Walter Scott.

WALTER SCOTT: I move the meeting be adjourned.

WARREN BUFFETT: Is there a second?

RON OLSON: I second the motion.

WARREN BUFFETT: A motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say aye.

VOICES: Aye.

Warren's Presentation – 2020 Meeting (Virtual)

Warren Buffett: This is the annual meeting of Berkshire Hathaway. It doesn't look like an annual meeting. It doesn't feel exactly like an annual meeting, and it particularly doesn't feel like an annual meeting because my partner of 60 years, Charlie Munger, is not sitting up here. I think most of the people that come to our meeting really come to listen to Charlie. But I want to assure you, Charlie at 96 is in fine shape. His mind is as good as ever. His voice is as strong as ever, but it just didn't seem like a good idea to have him make the trip to Omaha for this meeting. Charlie, Charlie is really taking to this new life. He's added Zoom to his repertoire. So has meetings every day with various people, and he's just skipped right by me technologically. But that really isn't such a huge achievement. It's more like, kind of like stepping over a peanut or something. But nevertheless, I want you to assure you, Charlie is in fine shape, and he'll be back next year. We'll try to have everything in the show that we normally have next year.

Ajit Jain also, who is the vice chairman in charge of insurance, is safely in New York. Again, it just did not seem worthwhile for him to travel to Omaha for this meeting. But on my left we do have Greg Abel, and Greg is the vice chairman in charge of all operations except insurance. So Greg manages a business that has more than 150 billion in revenues and crosses across dozens of industries and has more than 300,000 employees. He's been at that job a couple of years, and frankly, I don't know what I'd be doing today if I didn't have Ajit and Greg handling the duties that I was doing only about a quarter as well a couple of years ago. So I owe a lot of thanks to Greg, and you'll get exposed to him more as this meeting goes along.

The meeting will be divided into four parts, and in a moment or two, I will talk. Sort of a monologue with slides. I've never really used slides before. I've taught college classes intermittently but pretty steadily from age 21 to age 88, and I never recall using a single slide. But who says you can't teach an old dog new tricks? So we'll see whether you can or not. I've got a number of slides, and I would like you to take you through those. The first section, which we'll start in just a minute, and then we'll move on to a brief recap of Berkshire's first quarter results.

Now we put those up in the 10Q, which was posted on the internet and berkshirehathaway.com this morning. There's lots and lots of detail in there, so I'm not going to go through that. I'll point out one or two things that may be of interest to you, and actually I'll talk a little bit about what we did on April, which something that is new to Berkshire, be that current. But I'll give you that. Then we'll have the formal meeting, which will take maybe 15 or 20 minutes, and from there we'll go to Becky Quick, who for a couple of hours will grill me and Greg on questions she's selected from a huge batch that I'm told she's received. They went to Carroll Lumas and Andrew Ross Sorkin as well as to Becky, but to simplify things. We've consolidated all those questions that Becky will ask. Like I say, we'll go for a couple of hours, and there's no specified cutoff time present. We'll just see how things develop.

What's of course on everybody's mind the last two months or so is what's going to be the situation in terms of health in the United States and what's going to be the situation in terms of the economy in the United States in the months and perhaps the years to come. I don't really have anything to add your knowledge on health. In school, I did okay in accounting, but I was a disaster in biology. I'm learning about these various matters the same way you are.

I think, personally I feel extraordinarily good about being able to listen to Dr. Fauci, who I had never heard of a year ago. But I think we're very, very fortunate as a country to have somebody at 79 years of age who appears to be able to work 24 hours a day and keep a good humor about him and communicate in

a very, very straightforward matter about fairly complex subjects and tell you when he knows something and when he doesn't know something. So I'm not going to talk about any political figures at all or our politics generally this afternoon, but I do feel that I owe a huge debt of gratitude to Dr. Fauci for educating and informing me, actually along with my friend Bill Gates too, as to what's going on. I know I get it from a straight shooter when I get it from either one of those. So thank you Dr. Fauci.

When this hit us, and as I sit here in this auditorium with 17 or 18,000 empty seats. The last time I was here, it was absolutely packed. Creighton was playing Villanova, and there were 17 or 18,000, whatever it holds. It was full, and there wasn't one person in that crowd. This was in January. There wasn't one person in that crowd that didn't think that March madness wasn't going to occur. It's been a flip of the switch in a huge way in terms of national behavior, the national psyche. It's dramatic. When we started on this journey, which we didn't ask for, it seemed to me that it was an extraordinary wide variety of possibilities on both the health side and on the economic side. There was DEFCON 5 on one side and DEFCON 1 on the other side, and nobody really knows, of course, all the possibilities that there are, and they don't know what probability factor to stick on them.

But in this particular situation, it did seem to me that there was an extraordinary range of things that could happen on the health side and an extraordinary range in terms of the economy. Of course they intersect and affect each other. So they're bouncing off each other as you go along. I would say, again, I don't know anything you don't know about health matters, but I do think the range of possibilities has narrowed down somewhat in that respect. We know we're not getting a best case, and we know we're not getting a worst case. The possibility initially of the virus was hard to evaluate, and it's so hard to evaluate. There's a lot of things we've learned about it, a lot of things we know we don't know, but at least we know what we don't know. Some very smart people are working on it, and we're learning as we go along.

But the virus obviously has been very transmissible, but on the good side, it's not that good, but it is not as lethal as it might have been. We had Spanish flu in 1918 and my dad and four siblings and his parents went through it, and they have a terrific story in the March 15th edition of the Omaha World Herald that you can go to on omaha.com and look up. It's also on the first page I believe on Google, if you put in Spanish flu Omaha. During that particular time in maybe four months or so, Omaha had 974, I believe, deaths, and that was a half of 1% of the population. That figure wasn't greatly different than around the country. So you think about half of 1% of the population now you're talking 1,700, 000 or thereabouts people and fortunately in terms of the worst case, this does not appear to, in fact I think you can almost rule out it being as lethal as the Spanish flu was. But it's very, very transmissible. Of course we have the problem, we don't know the denominator in terms of exactly how lethal it is because we don't know how many people have had it and didn't know they had it.

But in any event, the range of probabilities on health narrowed down somewhat, I would say the range, the probabilities, or possibilities, and on the economic side are still extraordinarily wide. We do not know exactly what happens when you voluntarily shut down a substantial portion of your society. In 2008 and '09, our economic train went off the tracks, and there were some reasons why the [inaudible] was weak in terms of the banks and all of that sort of thing. But anyway, this time we just pulled the train off the tracks and put it on a siding, and I don't really know of any parallel in terms of very, very one of the most important country in the world. Most productive, huge population. In effect sidelining its economy and its workforce and obviously and unavoidably creating a huge amount of anxiety and changing people's psyche and causing them to somewhat lose their bearings in many cases, understandably.

This is quite an experiment and we may know the answer to most of the questions reasonably soon, but we may not know the answers to some very important questions for many years. So it still has this

enormous range of possibilities. But even facing that, I would like to talk to you about the economic future of the country because I remain convinced as I have. I was convinced of this in World War II. I was convinced of it during the Cuban missile crisis, 9/11, the financial crisis, that nothing can basically stop America. We faced great problems in the past. We haven't faced this exact problem. In fact, we haven't really faced anything that quite resembles this problem, but we faced tougher problems the American miracle, the American magic has always prevailed, and it will do so again.

I would like to take you through a little history to essentially my case that if you were to pick one time to be born and one place to be born, and you didn't know what your sex was going to be, you didn't know what your intelligence would be. You didn't know what your special talents or special deficiencies would be. That if you could do that one time, he would not pick 1720, you would not pick 1820, you would not pick 1920. You'd pick today, and you would pick America, and of course the interesting thing about it is that ever since America was organized in 1789 when George Washington took the oath of office, people have wanted to come here. Can you imagine that? For 231 years, there's always been people that have wanted to come here.

My friend, I think I just jumped the gun just a shade. I'm putting up slide on. But I'm going to call from some slides as we go along. But the interesting thing about this country is what is on slide one? Let's put it up. This is an extraordinarily young country. Now I'm comparing it to a couple of guys that are pretty old, but when you think about the fact that my age, Charlie's age, our life experience, and then we'll throw in this young guy over here, Greg Abel, and if our life experiences combined exceed the life of the United States, we are a very, very young country. But what we've accomplished is miraculous. Now just think of this. This little spot in history.

If we go to slide two, I've tried to estimate... Well, let's go back. Stay with slide two, but the population in 1790, and we had 3.9 million people here. It's funny, when you look up census figures, you find out that they had a big fire and the Department of Commerce building in 1921, so they lost a lot of the census records. So there's some things where there's a few gaps, but there were 3.9 million people in the United States. Actually, I've got .6 million. It's closer to .7 million. There were 700,000 of those people were slaves at the time. But those 3.9 million people were one half of 1% of the population of the planet.

If you'd asked any of those 3.9 million people, any of them to imagine what life would be like 231 years later, even the most optimistic person; they could have been drinking heavily and even had a little pot, and they still could not in their wildest dreams have thought that in three lifetimes, Charlie's mine, and Greg's, that in that period you would be looking at a country with 280 million vehicles shuffling around its roads. Airplanes, maybe not today so much, but they'll be back again. They were flying people at 40,000 feet coast to coast, five hours. That great universities would exist in one state after another, and great hospitals systems, and entertainment would be delivered to people in a way nobody could have dreamt of in 1790s. This country in 231 years has exceeded anybody's dreams.

I went to the internet trying to prepare for this, and if you'll move to the next slide, I tried to find out what was the wealth of the country in 1789, our starting point. I punched in United States wealth. I tried 1789, I tried 1790. I thought it might be a little easier in terms of a round year, and I think four. million or so references came up. I didn't look at all 4 million, but I can tell you the data collection in those early days on many fronts was not anything like today. You really can't find what I would consider a reliable figures. You can find out how many mules there were in the country and a few things like that, and try to add them up. But in real estate, when you're looking at houses or apartment houses or office buildings, they're each slightly different than each other, but they looked at comparable sales.

So it's hard to find a lot of countries where the wealth has been estimated. But it was interesting to go back and think about the fact that in 1803 we purchased for \$15 million, we made the Louisiana purchase. Now that's a little later than 1789, but that's the best comp, as they say in real estate. That's the best combine we could find for land mass, anyway. When we made that purchase, that was equal incidentally to about a quarter, about 800,000 plus square miles. But it was about a quarter of what the lower 48 States now contain. So we bought about a quarter of the lower 48 for those \$15 million back in 1803. If you live in Texas and your grandfather is close to dying, and he calls the grandchildren, children around him. In his final words, he always says, "Don't sell the mineral rights." Well, the French sold us the mineral rights on that \$15 million deal as well. So we got that whole strip there. We got all of Kansas, essentially all of Oklahoma, and they've produced 21 billion barrels of oil for us, a lot of natural gas since the purchase.

One of the sidelights is that we paid our 15 million for the Louisiana purchase. We paid 3 million of it, 20% of it. We paid with 200,000 ounces of gold, valued at 15 bucks an ounce, and that three million that the French took. We got South Dakota as part of the Louisiana purchase, and the home state mine up there, before it closed, produced well over 40 million ounces of gold and 40 million ounces of silver, that comes to about \$60 billion worth. Like I say, 200,000 ounces took care of 20% of our purchase price. So the Louisiana purchase was a bargain, but it's what the going price was for 800,000 square miles, I guess, at the time, and three cents an acre. So I decided by playing around with various numbers such as that, that as a reasonable estimate of the worth of the country in 1789, a billion was not a crazy figure. Now, if I'd been an academician or something, I would've put 1,107,400,000, something like that. I would have made it look respectable. But it's a wild guess. But it's not a crazy figure.

So what has happened, let's move on to the next slide, to the wealth of the country since then? Here we have some figures that come out pretty regularly. Well, they do come out regularly where the Federal Reserve estimates the net household worth of people in the United States, all all the households in the United States. You can look these up, and you'll see that there's 30 trillion of stocks, and I think maybe single family homes. What are there? There's 82 million or so owner occupied single families, maybe 45 million rental apartments and so on. So you start adding all these up, and the Federal Reserve tells us, and I invite you to look at the data; it's kind of interesting, that we now in the United States, 231 years later, we have a hundred trillion. We have more than a hundred trillion of household wealth, even though the stock market's gone down somewhat since the last quarter report.

So you say, "Well, we've had a lot of inflation, everything." We actually, in the United States, for the first half of our existence, roughly, we didn't really have that much inflation. We had inflationary periods and deflationary periods, but the general price level did not change that dramatically. But I will assume again for this calculation that there's been 20 for one inflation. It's way less than that in many commodities, and it's very hard to measure and talk about equivalent benefits from different kinds of products and so on, and costs. But I think it's reasonable to say that the United States in real terms has increased in wealth at something in the area of 5,000 for one, which is really, it's mind blowing. 5,000 for one in real terms, in a country that had a half a percent of the, and a bunch of raw land. But a vision that to accomplish that in 231 years, there's just no denying that that's beyond what anybody could have dreamt earlier.

But it was not done, and this is important, because we've now hit a bump in the road. It was not done without some very, very serious bumps in the road. It was not 231 years of steady progress. In matter of fact, we had been in the birth of this country. We'd been into it, what? 72 years and if we go to the next slide, 1861 we now had about 31 million people. The 1960 census showed around 31 million people or thereabouts in the country and four million of them were slaves, and we had never really resolved the very much unfinished business of what was involved in compromises in 1789, and we'll have more to say

about that later. But we had something that not too many countries experienced, and if you had told people in 1789 that in 72 years, you were going to have a division that causes the President of the United States at Gettysburg to say that testing whether that nation, or any nation so conceived and dedicated, can long endure. Imagine the President of the United States wondering aloud whether the country that he was presiding over could long endure, only 72 years or 74 years at Gettysburg, had taken place.

So while this marvelous dream was being played out, roughly a third of the way through it, we face this really moment of decision, and we entered into a contest that, if we'll go to the next slide, I made an estimate. That literally killed roughly 6% of the males in the country who were between 18 and 60. I'm assuming that there were more than 600,000 deaths in the war. I think it's a reasonable estimate that that 18 to 60 group, males, were by far the great proportion. So imagine 6% of your working prime age males in a country are wiped out in four years. So when we look at the progress of this country and we think of our own problems now, I just ask you to ponder and we'll move to the next slide. That would be equivalent today to having four million males in that same age group similarly wiped out. So that was one incredible interruption which this country nevertheless worked through while compiling this American dream that is one of the wonders of the world, perhaps the wonder of the world in many senses.

So let's move on to another crisis of a different sort, that hit the country, and this of course is the 1929 crash, which led to the Great Depression. Here the Dow Jones average, which we'll use through this. At that time, that's the one everybody paid attention to, actually. The second most important average at that time, if you look at the papers, was the New York Times average, which has disappeared, and of course the Standard and Poor's has probably, regardless is a superior yardstick. But the Dow Jones is a perfectly adequate yardstick. On September 3rd, 1929, the Dow Jones average closed at 381.17, and people were very happy and buying stocks on margin that worked wonderfully.

The roaring twenties had a good feeling to it with the auto coming of age and the day of air travel coming along and all kinds of new appliances and the telephone getting wider use, believe it or not. Hadn't really caught on that much prior thereto. But the movies were coming on. It was a happy place. Then, of course, if we go to the next slide, we'll look at what happened in the couple of months after September 3rd and the Dow Jones average almost got cut in half, and that was pretty impressive until we had this recent situation where in a shorter period of time we lost about a third. But the crash, and there's a great book about it called The Great Crash by John Kenneth Galbraith. Let me interject one little plug here. There's a small business in Omaha, and I hate what this-

... a small business in Omaha, and I hate what this is truncating this meeting, or changing can so dramatically has done to many of the businesses in Omaha, because I think small business is beneficial, and we're the beneficiaries of a really ... they got a lot of business with the Berkshire meeting, and they're going to get it in the future, but they suffer during a period like this, and they just had a story about The Bookworm.

Well, The Bookworm, if you buy any books that come out of anything I recommend, think about just put in Bookworm in Omaha, and The Great Crash is a wonderful book of mine, John Kenneth Galbraith describes it, but I would like to get into a bit of a personal note which will have some relevance, not too much, but some relevance to the story of the great depression, because in 1929 my dad, who was 26 years of age then, was employed as a security salesman by a local small bank, and he sold stocks and bonds, but mostly he sold stocks.

And when stocks fall 48%, and they were selling them to people a few months ago, you really don't feel like going out and facing those same people, so I think my dad probably liked to do was, they say now, shelter in place, which means stay at home, and there really wasn't that much in our house, we just had a

small yard, it was wintertime anyway, my dad wouldn't have been putting on the yard anyway, and the television wasn't there, and he and my mother got along very well.

So under those conditions, if you'll turn to the next slide, I was born about nine months later, but at that time, I was actually born on August 30th, but the stock market was closed that day, and so I'm using the previous day figures, but I didn't notice at the time that the market was closed, but the stock market had actually recovered over 20% during that nine and a half month period or thereabout.

People did not think in the fall of 1930, they did not think they were in a great depression, they thought it was a recession very much like had occurred at least a dozen times, although not always when stock markets were important, but we'd have many recessions in the United States over that time, and this did not look like it was something dramatically out of the ordinary. For a while, actually for about 10 days after my birth, that'd be [inaudible] and the stock market actually managed to go up all of 1-2% there in those 10 days, but that's the last day.

Well, from that point, if you'll turn to the next slide, the stock market went from level of 240 to 241, which was a noticeable decline, because if somebody had given me \$1,000 on the day I was born, and I'd bought stocks with it, and bought the Dow Average, my \$1,000 would have become \$170 in less than two years, and that is something that none of us here have ever experienced that we may have had it with one stock occasionally, but in terms of having a broad range of America mark down 83% in two years, and mark down 89% of the peak, that was in September 3rd, 1929, was extraordinary.

In that intervening period, less than one year after I was born, just slightly less than one year, my dad went to the bank where he worked and had his account, and of course the bank had a sign out of "closed" and so he had no job, and he had two kids at that point, and his father had a grocery store, but Charlie and I both worked for my grandfather. Charlie worked there in 1940, I worked there in 1941, so we didn't know each other but my grandfather said to my father that, "Don't worry about your groceries, Howard," he says, "I'll just let your bill run."

That was my grandfather's word exactly, he cared about his family but he wasn't going to go crazy, and one of the things as I look back on that period is, and I don't think the economists generally like to give it that much of a point of importance, but if we'd had the FDIC 10 years earlier, the FDIC started on January 1st, 1934, it was part of the sweeping legislation that took place when Roosevelt came in, but if we'd had the FDIC we would have had a much, much different experience, I believe, in the great depression.

People blaming on smooth hall here, and they ... I mean, there's all kinds of things, and the margin requirements in '29, and all of those things entered into creating a recession, but if you have over 4,000 banks fail, that's 4,000 local experiences where people save, and save, and save, and put their money away, and then someday they reach for it and it's gone, and that happens in all 48 states, and it happens to your neighbors, and it happens to your relatives, it has to have an effect on the psyche that's incredible.

So one very, very, very good thing that came out of the depression, in my view, is the FDIC, and it would have been a somewhat different world, I'm sure, if the bank failures hadn't just rolled across this country, and with people that thought that they were savers find out that they had nothing when they went there and there was a sign that said, "Closed."

Incidentally, the FDIC, I think very few people know this, or at least they don't appreciate it, but the FDIC has not cost the American tax payer a dime, I mean its expenses have been paid, its losses have been paid all through assessments on banks, it's been a mutual insurance company of the banks backed by

the federal government, and associated with the federal government, but now it holds \$100 billion and that consists of premiums that were paid in an investment income on the premiums, plus the expenses, and paying of all the losses, and think of the incredible amount of peace of mind that's given to people that were not similarly situated when the great depression hit.

So the great depression went on, and it lasted a very long time, but it lasted a lot longer in the minds of people than it did actually in its effects. World War II came along, and on sort of an involuntary manner we adopted Keynesianism, we started running fiscal deficits, of course, that were absolutely huge, and took our debt up to a percentage of GDP, which we had never reached before, and never have reached since.

So we had an enormous economic recovery, but the minds of people had been so scarred, the memories, parents told their children, 1929 became a symbol in people's minds, I mean, if you said 1929 it was like saying 1776, or 1492. I mean, everybody knew exactly what you were talking about, and it affected stock prices in a rather remarkable way to the point, if you'll change to the next slide, it was January 4th of 1951 that the kid who was born on August 30th in 1930 had finished college before the stock market got back to where it was at that earlier time.

So take the years from 1920, 1930, or 1929 really into the 1951, or take the year from my birth, 20 years, and bear in mind that the country was only 140 years old when they started, that's 20 years out of this amazing 231-year lifetime of our country, that was flat out a time of for a long time with no economic growth, and no feeling by people in terms about the wealth of the country, about what American economy was worth, about all these corporations that were doing far, far, far better than they were, all in all, but it took all of that time to restore in the market a price level that was equal to what it was when I was born 20 years earlier.

So, if you think about the fact that we're enduring a few months, and we'll endure some many more months, and we don't know how it comes out, and people in the '30s didn't know how it was going to come out, but they endured, persevered, prospered, and the American miracle continued. But it's interesting in that I actually don't have a slide for the next one, because last night I was thinking after all the slides had been prepared, I was actually thinking about this a little bit, and I remembered that at the start of 1954 the stock market was ... the Dow was only at about 280, and I remember 1954 because it was the best year I ever had in the stock market.

And the Dow went from essentially what? 280 or thereabout at the start of the year, to a little over 400 at the end of the year, and when it went to 400, as soon as it went across 381, that famous figure from 1929, when it went to 400, and this will be hard for some of you to believe, but everybody wondered, "Is this 1929 all over again?"

And that seems a little farfetched because it was a different country in 1954, but that was the common question, and it actually achieved such a level of worry about whether we were about to jump off another cliff just because the 381 of 1929 had been exceeded, that they held, Senator Fulbright, Bill Fulbright of Arkansas, who became very famous later in terms of the foreign relations committee, but he headed the Senate Banking Committee, and he called a special per special investigation, and he calls it the, what did he call it? The stock market study, but it really, if you read through it, he really was questioning whether we had built another house of cards again, and on this committee, it's interesting to see the Senate Finance Committee, one of the members was Prescott Bush, the father of George H. W. Bush, and grandfather of George W. Bush, and it had some illustrious names.

His committee, in March of 1955, with a Dow of 405, assembled 20 of the best minds in the United States to testify as to whether we were going crazy again, because the market was at 400, the Dow was at 400, and we had gotten in this incredible trouble before, but that was the mindset of the country, it's incredible.

We didn't really believe America was what it was, and my was, the reason I'm familiar with this 1000-page book that I have here, I found it last night in the library, was that I was working in New York for one of the 20 people that was called down to testify before Senator Fulbright, and he testified right before Bill Martin, who was running the Federal Reserve, testified, and right after General Wood who was running shares testified, theirs was very, very important then, and Bill Martin of course was the fellow that longest running chairman in the history of the Fed, and he's the one that gave the famous quote about the function of the Fed was to take away the punch balls just when the party started to get really warmed up.

But Ben Graham, my boss, sent me over to the public library in New York to gather some information for him, something he could do in five minutes with a computer now, and I dug out something, and he went to testify, and on page 545 of this book, I knew where to look, I didn't have to go through it all, but the quote which I remember, and I remember because Ben Graham was one of the three smartest people I've met in my life, and he was the dean of people in securities business, he wrote the classic Security Analysis book in 1934, he wrote the book that changed my life, Intelligent Investor in 1949, he was unbelievably smart.

And when he testified, with the Dow at 404, he had one line in there right toward the start in his written testimony, and he said, "The stock market is high, looks high, it is high, but it's not as high as it looks." But he said, "It is high." And since that time, if we'll turn to the next slide, of course, we felt the American tailwind at full force, and the Dow, well let's see, when the Dow was ... it went down on Friday, but when we made the slide it was about 24,000 so you're looking at a market today that has produced \$100 for every dollar, all you did was you had to believe in American just by a cross-section of America, you didn't have to read the Wall Street Journal, you didn't have to look up the price of your stock, you didn't have to pay a lot of money in fees to anybody, you just had to believe that the American miracle was intact.

But you'd had this testing period between 1929 and well really certainly 1954, as indicated by what happened when it got back up to 380, you had this testing period, and people really they'd lost faith to some degree, they just didn't see the potential of what America could do. We found that nothing can stop America when you get right down to it, and it's been true all along, it may have been interrupted.

One of the scariest of scenarios, when you had a war with one group of States fighting another group of States, and it may have been tested again in the great depression, and it may be tested now to some degree, but in the end the answer is never bet against America, and that in my view is as true today as it was in 1789, and even was true during the civil war, and the depths of the depression.

Now, I'm now about to say something that, and don't change the slide yet, but I'm now about to say something that some of you will be tempted to argue with me about, but I would make the case that we are imperfect in a great, great, great many ways, but I would say, and if you pull up the next slide, that we are now a better country as well as an incredibly more wealthy country than we were in 1789. We're far, far, far from what we should be, will be, but we have gone dramatically in the right direction.

It's interesting, in 1776, we said we hold these truths to be self-evident that all men are created equal, endowed by their creator with certain unalienable rights, among these are life, liberty, and pursuit of happiness, and yet 14 years later, a year after we really officially began the country in 1789, adopted a constitution. We found that more than 15% of the people in the country were slaves, and we wrestled with

that, but when you say the word self-evident, that sort of sounds like you're saying any damn fool can recognize that, and you certainly say, he can argue maybe a little bit about life, and the pursuit of happiness, but I don't see how in the world anybody can reconcile liberty with the idea that 15% of the population was enslaved, and it took us a long time to at least partially correct that.

I mean it took a civil war, it took losing 6% of those people, males that were between 18 and 60 years of age, but we've moved in the right direction, we've got a long ways to go, but we've moved in the right direction now. In addition, going back again to that 1776 statement, that all men are created equal, and endowed by their creator, et cetera.

I think it was self-evident to the 50% of the population that they were getting a fair deal for over half the lifetime of the country. It took 131 years until women were guaranteed the right to vote for our country's leaders, and then what's even more remarkable is that after we adopted them, the 19th amendment, 1920, it took 61 more years until a woman was allowed to join those eight males on the Supreme Court. I grew up thinking that the Supreme Court must have been somewhat ... said there had to be nine men, but at 61 years, so took 192 years before Sandra Day O'Connor was appointed to the court, and now you can say that there was a pipeline problem.

Half the population may have been women in 1920, but there weren't half the lawyers, or I think were 10% of the lawyers probably. So you can understand some delay, but 61 years is a long time to go and to pick 33 males in-between. If that was entirely by chance, then the odds against that fewer flipping coins is about eight billion to one, like I said, there was a pipeline problem, but it took us a long, long time, and it's not done yet, but I think it does give meaning to the fact that we are a better society with a lot of room to go, that we are a better society that existed in 1789.

When you go to Colonial Williamsburg, I've been there a couple of times, as a matter of fact, I watched the debate between Jimmy Carter and Gerald Ford there in the 1976, and it was not a great time to be black, it was not a great time to be a woman, and both of those categories still certainly got potential for significant improvement in terms of fulfilling that pledge made in 1776 about how we believe that it's self-evident that all men were created equal, but we have made progress, we are a better society, and we will, as the years go by. If you'll move to the next slide, and I believe that, and I think, let's see if I can get these slides in the proper order here. I believe that when you get through evaluating all of the qualitative facts, what we have done toward meeting the aspirations of what we wrote in 1776, what we wrote in 1776 wasn't a fact, but it was an aspirational document, and we have worked toward those aspirations, and we have a long way to go, but I'll repeat, if you move to the next slide, that never, never bet against America.

Now, let's move on now to a much broader subject, what I don't know. I don't know, and perhaps with a bias, I don't believe anybody knows what the market is going to do tomorrow, next week, next month, next year. I know America is going to move forward over time, but I don't know for sure, and we learned this on September 10th, 2001, and we learned it a few months ago in terms of the virus. Anything can happen in terms of markets, and you can bet on America, but you got to have to be careful about how you bet, simply because markets can do anything.

On October, whatever it was in 1987, October 11th I believe, a Monday, markets went down 22% in one day. In 1914, they closed the stock market for about four months, after 9/11 closed the market for four days, we hustled to get it going again, but nobody knows what's going to happen tomorrow. So when they tell you to bet on America, and I tell you that that's what's really gotten me through ever since I bought my first stock when I was 11, I mean I caught a huge, huge, huge tailwind in America, but it wasn't going to blow in my direction every single day, and you don't know what's going to happen tomorrow.

I would like to context to the present news, point out something you may find kind of interesting. If you go to YouTube, you'll find on June 17th, of 2015, four-plus years ago, you'll find Sam Nunn, that was one of the people I admire the most in the United States and in the world, enormous patriot and tremendous senator, and he's carried on thankless work since leaving the Senate, and heading something called the Nuclear Threat Initiative, which most of you haven't heard of, but I've been slightly involved in it, Sam Nunn founded that.

And, the Nuclear Threat Initiative is simply organizations that are devoted to trying to reduce the chances of something of a nuclear chemical, biological, and now cyber nature, from either malevolent or accidental or whatever may be, from causing deaths to millions of Americans, and among the things that Sam co-founded it, but he's been the heart and soul of the organization subsequently, and he's talked about, worried about pandemics along with the nuclear threat for decades, and he's participated in war games where they play out various scenarios, including malevolent pandemics that could be started by the same kind of nut that sent the anthrax letters around the 9/11, a little after. Sam paired down this YouTube presentation, and I'm sure he's been on many others I just happened to look this one up, and talked about the dangers of a pandemic, and anybody should listen to Sam Nunn anytime he talks. So he said at that time, "Germs don't have borders," which we certainly learned in the last couple of months, and when I clicked on YouTube, if you'll go to the next, I found out that basically it had 831 views, and this was only a few days ago, I looked it up, but I don't know whether most of those views have just been the last few days or the last few months, I shouldn't say, because of the interest in pandemics, but it is hard to think about things that haven't happened yet. So we can experience, and when something like the current pandemic happens, it's hard to factor that in, and that's why you never want to use borrowed money, at least in my view, and then buy into investments.

And we run Berkshire that way, we run it so that we literally try to think of the worst case of not only just one thing going wrong, but other things going wrong at the same time, maybe partly caused by the first, but maybe independent even of the first. You learned in, I don't know what grade now, probably earlier than when I went to school, but in fifth or sixth grade, that you can have any series of numbers times zero, and you just need one zero in there and the answer is zero, and there's no reason to use borrowed money to participate in the American tailwind, but there's every other reason to participate.

Now, I can't resist pointing out that in October of 2019, a large 300-page, I've got it right here, a book was brought out, and Johns Hopkins ...

And Johns Hopkins, one of the most respected institutions, country, Nuclear Threat Initiative, NTI, and the Intelligence Group at The Economist collaborated to evaluate the problems of the worldwide preparedness for pandemics, essentially.

And I think in November, Sam came out to see me with Ernie, more recent former Secretary of Energy who now is the CEO of NTI. He and Sam are co-chairmen, and Beth Cameron who did a lot of work on this report came out to see me. And they gave me in November I believe of last year, they gave me this appraisal. And the opening line, if you'll turn the page, this is the opening line of this 300-page tome: "Biological threats—natural, intentional, or accidental—in any country can pose risks to global health, international security, and the worldwide economy."

And this book was prepared in order to evaluate the preparedness of the various countries and rank them. We ranked pretty well, but all of us got a failing... All of the countries got a failing grade, basically.

Now, you would think with the prestige of Johns Hopkins and The Economist, along with people like Sam and Ernie, etc., that this would've gotten some attention. And, again, Sam... Turn to the next page.

Sam and the others went on YouTube on October 24, 2019, and they have racked up, as of a couple days ago, 1,498 views.

Now, my friend Bill Gates was delivering the same warning at a TED Talk some years back. And he's gotten a lot more views. But it just says something about the fact that you're going to get both from the blue, and you can read papers about them, and you can talk about what'll happen if some, as they used to, the fellows would say, Salomon used to tell me, some 25-sigma event comes along, and they'll then say that that'll happen once in the life of the universe. And then it happens to them a couple times in a month, and they go broke.

You just don't know what's going to happen. You know, at least in my view, you know that America's tailwind is not exhausted. You're going to get a fine result if you own equities over a long period of time. And the idea that equities will not produce better results than the 30-year Treasury bond, which yields one and a quarter percent now, it's taxable income. It's the aim of the Federal Reserve to have 2% a year inflation. Equities are going to outperform that bond. They're going to outperform Treasury bills. They're going to outperform that money you've stuck under your mattress.

I mean, they are an enormously sound investment as long as they're an investment and they're not a gambling device or something that you think you can safely buy on margin or whatever it may be.

It's interesting that stocks offer, which, and stocks are a... We always look at stocks as just being a part of a business. I mean, stocks are a small part of a business. If in 1789 you'd saved a small amount of money and it wasn't easy to save, you might've bought with those savings, you might've bought a tiny, tiny plot of property.

Maybe you bought a house that could be rented to somebody, but you didn't really have the chance to buy in with 10 different people who were developing businesses, and who were presumably putting their own money in, and that would have the American tailwind behind. And of the 10, a reasonably high percentage would succeed in a way and earn decent returns, but those are the choices. You might have had to do with savings.

And they started offering bonds originally. And there again you got a limited return. But the return in those days may have been 5% or 6% or something of the sort. But you can't buy risk-free bonds. I mean, the yardstick for me is always the U.S. Treasury. And when somebody offers you quite a bit more than the U.S. Treasury, there's usually a reason. There's much more risk.

But going back to stocks, people bring the attitude to them too often that because they are liquid and quoted minute by minute that it's important that you develop an opinion on them minute by minute. Now, that's really foolish when you think about. And that's something Graham taught me in 1949, I mean, that single thought, that stocks were parts of businesses and not just little things that moved around on charts or... Charts were very popular in those days, and whatever it may be.

Imagine for a moment that you decided to invest money now, and you bought a farm. And the farmland around here, let's say you bought 160 acres, and you bought it at x per share, or per acre. And the farmer next to you had 160 identical acres, same contour, same quality, soil quality, so it was identical. And that farmer next door to you was a very peculiar character because every day that farmer with the identical farm said, "I'll sell you my farm, or I'll buy your farm at a certain price," which he would name.

Now, that's a very obliging neighbor. I mean, that's got to be a plus to have a fellow like that with the next farm. You don't get that with farms, you get it with stocks. You want 100 shares of General Motors,

and then on Monday morning, somebody will buy you 100 shares or sell you another 100 shares at exactly the same price. And that goes on, I don't know, five days a week.

But just imagine if you had a farmer doing that. When you bought the farm, you looked at what the farm would produce. That was what went through your mind. You were saying to yourself, "I'm paying x dollars per acre. I think I'll get so many bushels of corn or soybeans on average, some years good, some years bad. And some years the price will be good. Some years the price will be bad," etc.

But you think about the potential of the farm, and now we get this idiot that buys the farm next to you, and on top of that, he's sort of a manic depressive and drinks, maybe smokes a little pot. So his numbers just go all over the place. Now, the only thing you have to do is to remember that this guy next door is there to serve you and not to instruct you. You bought the farm because you thought the farm had the potential. You don't really need a quote on it. If you bought in with John D. Rockefeller or Andrew Carnegie, and da, da, da, da, there were never any quotes. Well, there were quotes later on, but basically you bought into the business. And that's what you're doing when you buy stocks. But you get this added advantage that you do have this neighbor who you're not obliged to listen to at all who is going to give you a price every day. And he's going to have his ups and downs. And maybe he'll name a selling price that they'll buy at, and in which case you sell if you want to.

Or maybe he'll name a very low price, and you'll buy his farm from him. But you don't have to. And you don't want to put yourself in a position to where you have to. So stocks have this enormous inherent advantage of people yelling out prices all the time to you, and many people turn that into a disadvantage. And of course many people can profit in one way or another from telling you that they can tell you what this farmer's going to yell out tomorrow or next... your neighboring farmer's going to yell out tomorrow, or next week, or next month.

There's huge money in it. So people tell you that it's important, and they know, and that you should pay a lot of attention to their thoughts about what price changes should be, or you tell yourself that there should be this great difference. But the truth is, if you owned the businesses you liked prior to the virus arriving, it changes prices, and it changes, but nobody's forcing you to sell. And if you really like the business, and you like the management you're in with, and the business hasn't fundamentally changed, and I'll get to that a little when I report on Berkshire, which I will soon, I promise, the stocks have an enormous advantage. And you can bet on America.

But you can't bet unless you're willing and have an outlook to independently decide that you want to own a cross section of America, because I don't think most people are in a position to pick single stocks; a few may be, but on balance, I think people are much better off buying a cross section of America and just forgetting about it. If you'd done that, if I'd done that when I'd got out of college, it's all I had to do to make 100 for 1 and then collect dividends on top of it, which increased, would increase substantially over time.

The American tailwind is marvelous. American business represents, and it's going to have interruptions, and you're not going to foresee the interruption, and you don't want to get yourself in a position where those interruptions can affect you either because you're leveraged or because you're psychologically unable to handle looking at a bunch of numbers.

If you really had a farm, and you had this neighbor, and one day he offered you \$2,000 an acre, and the next day he offers you \$1,200 an acre, and maybe the day after that he offers you \$800 an acre, are you really going to feel that at \$2,000 an acre when you had evaluated what the farm would produce, are you going to let this guy drive you into thinking, "I better sell because this number keeps coming in lower all

the time”? It’s a very, very, very important matter to bring the right psychological approach to owning common stocks.

But I will tell you, if you bet on America and sustain that position for decades, you’re going to do better than, in my view, far better than owning Treasury securities or far better than following people who tell you that what the farmer’s going to yell out next... There’s huge amounts of money that people pay for advice they really don’t need and for advice where the person giving it could be very well-meaning in it and believe their own line. But the truth is that you can’t deliver superior results to everybody by just having them trade around a business.

If you bought into a business, it’s going to deliver what the business produces. And the idea that you’re going to outsmart the person next to you, or the person advising you can outsmart the person sitting next to you is, well, it’s really the wrong approach.

So find businesses. Get a cross section. And in my view, for most people, the best thing to do is to own the S&P 500 index fund. People will try and sell you other things because there’s more money in it for them if they do. And I’m not saying that that’s a conscious act on their part.

Most good salespeople believe their own baloney. I mean, that’s part of being a good salesperson. And I’m sure I’ve done plenty of that in my life too, but it’s very human if you keep repeating something often enough. That’s why lawyers have the witnesses keep saying things over and over again, that by the time they get on the witness stand, they’ll believe it whether it was true in the first place or not.

But you are dealing with something fundamentally advantageous, in my view, in only common stocks. I will bet on America the rest of my life. And I hope my successors at Berkshire do it. Now, we do it in two different ways. We do it by buying entire businesses, and we buy parts of businesses.

And I would like to emphasize that... Well, I’d like to give you a few figures that will tie in from our activities in the first quarter and also what we’ve done in April. We are not right about... We do try to pick the businesses that we think we understand. We don’t buy the S&P 500. And we like to buy the entire businesses when we buy them, but we don’t get a chance to do that very often. Most of the best businesses are not available for sale in their entirety.

But we don’t mind in the least buying partial interest in businesses. And we would rather own 6% or 7% or 8% of a wonderful company and regard it as a partnership interest, essentially, in that company. And then we get an opportunity to do that through marketable securities. And sometimes we get more opportunities than others.

And with that, I hope I’ve convinced you to bet on America. Not saying that this is the right time to buy stocks if you mean by “right,” that they’re going to go up instead of down. I don’t know where they’re going to go in the next day, or week, or month, or year. But I hope I know enough to know, well, I think I can buy a cross section and do fine over 20 or 30 years. And you may think that’s kind of, for a guy, 89, that that’s kind of an optimistic viewpoint. But I hope that really everybody would buy stocks with the idea that they’re buying partnerships in businesses and they wouldn’t look at them as chips to move around, up or down.

So we will just now take a quick look. And I see we’ve got the Becky’s email address. So if you have questions on what I’ve said or other things, you can email these questions. And she is back there probably sort of a madhouse trying to handle questions coming in and pick out the ones she’s going to prioritize. But feel free to, anything I’ve talked about so far, to send a long to her, and we’ll keep her address up when I later hold the formal part of the meeting too.

Very briefly in terms of Berkshire, in the first quarter, if you'll put up... Do we have the slides on that? There we are. Our operating earnings were... And there's much more about this in the 10-Q, and it's really not worth spending any real time on. But the operating earnings for the first quarter have no meaning whatsoever in terms of forecasting what's going to happen the next year.

And I don't know the consequences of shutting down the American economy. I know eventually it will work, whatever we do. We may make mistakes. We will make mistakes, and during this talk and later on, I'm not going to be second-guessing people on this because nobody knows for sure what any alternative action would produce or anything short.

But what we do know is that for some period, certainly during the balance of the year, but it could go on a considerable period of time, who knows, but our operating earnings will be less, considerably less than if the virus hadn't come along. I mean, that's just it. It hurts some of our businesses a lot. I mean, you shut down. Some of our businesses effectively have been shut down.

It affects others much less. Our three major businesses of insurance and the BNSF railroad, railroad and our energy business, those are our three largest by some margin. They're in a reasonably decent position. They will spend more than their depreciation. So some of the earnings will go, along with depreciation, will go toward increasing fixed assets.

But basically these businesses will produce cash even though their earnings decline somewhat. And if we'll go to part two, at Berkshire, we keep ourselves in an extraordinary strong position. We'll always do that—that's just fundamental. We insure people. We're a specialist to some extent and a leader. It's not our main business, but we sell structured settlements. That means somebody gets in a terrible accident, usually an auto accident, and they're going to require care for 10, 30, 50 years.

And their family or their lawyer is wise enough, in our view, to rather than take some big cash settlement to essentially arrange to have money paid over the lifetime of the individual to take care of their medical wills, bills, or whatever it may be. And we're large. We've got many, many, many people that in effect have staked their well-being on the promises of Berkshire to take care of them for, like I say, I mean, 50 years or longer into the future.

And, now, I would never take real chances with money, of other people's money under any circumstances. Both Charlie and I come from a background where we ran partnerships. I started mine in 1956 for really seven either actual family members or the equivalent. And Charlie did the same thing six years later. And we never, neither one of us, I think, I know I didn't, and I'm virtually certain the same is true of Charlie, neither one of us ever had a single institution investment with us.

I mean, every single bit of money we managed for other people was from individuals, people with faces attached to them, or entities, or money with faces attached to them. So we've always felt that our job is basically that of a trustee, and hopefully a reasonably smart trustee in terms of what we were trying to accomplish. But the trustee aspect has been very important. And it's true for the people with the structured settlements. It's true for up and down the line. But it's true for the owners very much too. So we always operate from a position of strength.

Now, I show on the slide that's up, I show our... Well, let's go back one. Yeah. I show our net, our cash and Treasury bill position on March 31st. And you might look at that and say, "Well, you've got \$125 billion or so in cash and Treasury bills. And you've got..." At least at that point, we had about, I don't know, \$180 billion or so in equities.

And you can say, “Well, that’s a huge position to have in Treasury bills versus just \$180 billion in equities.” But we really have far more than that in equities because we own a lot of businesses. We own 100% of the stock of a great many businesses, which to us are very similar to the marketable stocks we own. We just don’t own them all. They don’t have a quote on them.

But we have hundreds of billions of wholly owned businesses. So our \$124 billion is not some 40% or so cash positions, it’s far less than that. And we will always keep plenty of cash on hand, and for any circumstances, with a 9/11 comes along, if the stock market is closed, as it was in World War I—it’s not going to be, but I didn’t think we were going to be having a pandemic when I watched that Creighton-Villanova game in January either.

So we want to be in a position at Berkshire where... Well, you remember Blanche DuBois in *A Streetcar Named Desire*? That goes back before many of you. But she said she didn’t want them. In Blanche’s case, she said that she depended on the kindness of strangers. And we don’t want to be dependent on the kindness of friends even because there are times when money almost stops. And we had one of those, interestingly enough. We had it, of course, in 2008 and ’09.

But right around in the day or two leading up to March 23rd, we came very close but fortunately we had a Federal Reserve that knew what to do, but money was... investment-grade companies were essentially going to be frozen out of the market.

CFOs all over the country had been taught to sort of maximize returns on equity capital, so they financed themselves to some extent through commercial paper because that was very cheap and it was backed up by bank lines and all of that. And they let the debt creep up quite a bit in many companies.

And then of course they had the hell scared out of them by what was happening in markets, particularly the equity markets. And so they rushed to draw down lines of credit. And that surprised the people who had extended those lines of credit; they got very nervous. And the capacity of Wall Street to absorb a rush to liquidity that was taking place in mid-March was strained to the limit to the point where the Federal Reserve, observing these markets, decided they had to move in a very big way.

We got to the point where the U.S. Treasury market, the deepest of all markets, got somewhat disorganized. And when that happens, believe me, every bank and CFO in the country knows is, and they react with fear. And fear is the most contagious disease you can imagine; it makes the virus look like a piker.

And we came very close to having a total freeze of credit to the largest companies in the world who were depending on it. And to the great credit of Jay Powell, I’ve always had Paul Volcker up on a special place, special pedestal in terms of Federal Reserve chairman over the years. We’ve had a lot of very good Fed chairmen, but Paul Volcker, I had him at the top of the list. And I’ll recommend another, but Paul Volcker died about, I don’t know, less than maybe a year ago or a little less.

But not much before he died, he wrote a book called *Keeping it*. And if you call my friends at the Bookworm, I think you’ll enjoy reading that book. Paul Volcker was a giant in many ways. He was a big guy too. He and Jay Powell, couldn’t see more in temperament or anything, but Jay Powell, in my view, in the Fed board belong up there on that pedestal with him because they acted in the middle of March, probably somewhat instructed by what they’d seen in 2008 and ’09. They reacted in a huge way and essentially allowed what’s happened since that time to play out the way it has.

And then March, when the market had essentially frozen, closed a little after mid-month, ended up, because the Fed took these actions on March 23rd, it ended up being the largest month for corporate debt

issuance I believe in history. And then April followed through with even a larger month. And you saw all kinds of companies grabbing everything, coming to market and spreads actually narrow then. And every one of those people that issued bonds in late March and April, I sent a thank you letter to the Fed because it would not have happened if they hadn't operated with really unprecedented speed and determination.

And we'll know the consequences of swelling the Fed's balance sheet. You can look at the Fed's balance sheet. They put it out every Thursday. It's kind of interesting reading if you're sort of a nut like me. But it's up there on the Internet every Thursday. And you'll see some extraordinary changes there in the last six or seven weeks.

And like I say, we don't know what the consequences of that, and nobody does exactly. And we don't know what the consequences of what they undoubtedly will have to do. But we do know the consequences of doing nothing. And that would've been the tendency of the Fed in many years past, not doing nothing, but doing something inadequate. But more [inaudible] brought the whatever it takes to Europe and the Fed, then with March, sort of did whatever it takes, squared, and we owe them a huge thank you.

But we're prepared at Berkshire. We always prepare on the, on the basis that maybe the Fed will not have a chairman that acts like that. And we really want to be prepared for anything. So that explains some of the \$124 billion in cash and bills. We don't need it all.

But we never want to be dependent on not only the kindness of strangers but the kindness of friends. Now, in the next slide, we have the what we did in equities, and these numbers are tiny when you get right down to it. I mean, for having \$500 billion or so in net worth and... I mean, not net worth, but in market value at the start of the year or something close to that. We bought in \$1.7 billion of stock, and our purchases were a couple of billion more than our sales of equities.

But as you saw in the previous slide, we had operating earnings of \$5, almost \$6 billion. So we did very little in the first quarter. And then I've added in another figure, which I wouldn't normally present to you. But I want to be sure that if I'm talking to you about investments and stocks more than I usually have, I want you to know what Berkshire's actually doing. Now, you'll see in the month of April that we net sold \$6 billion or so of securities.

And that's basically, that isn't because we thought the stock market was going to go down or anything of this order because somebody changes their target price or they change this year's earnings forecast. I just decided that I'd made a mistake in evaluating. That was an understandable mistake. It was a probability-weighted decision when we bought that, we were getting an attractive amount for our money when investing across the airlines business.

So we bought roughly 10% of the four largest airlines, and we probably... This is not 100% of what we did in April, but we probably paid \$7 or \$8 billion and then somewhere between \$7 and \$8 billion to own 10-

And somewhere between seven and eight billion to own 10% of the four large companies in the airline business, and we felt for that, we were getting a billion dollars roughly of earnings. Now we weren't getting a billion dollars of dividends, but we felt our share of the underlying earnings was a billion dollars and we felt that that number was more likely to go up than down over a period of time. It would be cyclical obviously, but it was as if we bought the whole company. But we bought it through the New York Stock Exchange, and we can only effectively buy 10% roughly of the four. And we treat it mentally

exactly as if we were buying a business. And it turned out I was wrong about that business because of something that was not in any way the fault of four excellent CEOs.

I mean, believe me, no joy being a CEO of an airline, but the companies we bought are well managed. They did a lot of things right. It's a very, very, very difficult business because you're dealing with millions of people every day, and if something goes wrong for 1% of them, they are very unhappy. So I don't envy anybody the job of being CEO of an airline, but I particularly don't enjoy being it in a period like this, where essentially nobody... People have been told basically not to fly. I've been told not to fly for a while. I'm looking forward to flying them. May not fly commercial, but that's another question. The airline business, and I may be wrong and I hope I'm wrong, but I think it changed in a very major way, and it's obviously changed in the fact that there're four companies are each going to borrow perhaps an average of at least 10 or 12 billion each.

You have to pay that back out of earnings over some period of time. I mean, you're 10 or \$12 billion worse off if that happens. And of course in some cases they're having to sell stock or sell the right to buy a stock at these prices. And that takes away from the upside down. And I don't know whether it's two or three years from now that as many people will fly as many passenger miles as they did last year. They may and they may not, but the future is much less clear to me, [inaudible], how the business will turn out through absolutely no fault of the airlines themselves. That's something that was a low probability event happened, and it happened to hurt particularly the travel business, the hotel business, cruise business, the theme park business, but the airline business in particular. And of course the airline business has the problem that if the business comes back 70% or 80%, the aircraft don't disappear.

So you've got too many planes, but it didn't look that way when the orders were placed a few months ago, when arrangements were made. But the world changed for airlines and I wish them well, but it's one of the businesses we have. We have businesses we own directly that are going to be hurt significantly. The virus will cost Berkshire money. It doesn't cost money because of our stock. And various other businesses moves around. I mean, if XYZ, which say is one of our holdings and we own it as a business and we liked the business. The stock was down 20 or 30 or 40%. We don't feel we're poor in that situation. We felt we were poor in terms of what actually happened to those airline businesses just as if we don't a hundred percent of them.

So that explains those sales, which are relatively minor, but I want to make sure that nobody thinks that involves a market prediction. And that pretty well wraps it up for Berkshire. So now we move into the formal part of the meeting, which will be followed by a fairly extended question and answer period if there are a lot of questions with Becky. And while we're doing this formal part of the meeting, it's not too exciting. So feel free to leave whatever you're viewing this through, and if you want to send questions to Becky, we'll keep her contact information up on the screen. Or if you want to fix yourself a sandwich or do anything else, we will now move... Or you can pay attention to the formal part of the meeting. But we will do this, and it won't take too long, and then we will move on to the question and answer meeting.

Meeting Details – 2020 Meeting (Virtual)

Warren Buffett: So with that, I will call the meeting to order. And this follows the script, if you can't tell by what I'm saying. I'm Warren Buffett, chairman of the board of directors of the company, and I welcome you to this 2020 annual meeting of shareholders. Marc Hamburg is secretary of Berkshire Hathaway, and he will make a written record of the proceedings. Dan Jaksich has been appointed inspector of elections at this meeting. He will certify to the count of votes cast in the election for directors and the motions to be voted upon at this meeting.

The name proxy holders for this meeting are Walter Scott and Marc Hamburg. Does the secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

Marc Hamburg: Yes I do. As indicated in the proxy statement that accompanied this note, the notice of this meeting that was sent to all shareholders of record on March 4th, 2020, the record date for this meeting, there were 699,123 shares of class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting, and 1,382,352, 370 shares of class B Berkshire Hathaway common stock outstanding, with each share entitled to one 10000th of one vote on motions considered at the meeting. Of that number, 472,037 class A shares and 834,802,274 class B shares are represented at this meeting by proxies returned through Thursday evening, April 30th.

Warren Buffett: Thank you. That number represents a quorum, and we will therefore directly proceed with the meeting. First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Miss Debbie Bosanek who will put some motion before the meeting.

Debbie Bosanek: I move that the reading of the minutes of the last meeting of shareholders be dispensed with and the minutes be approved.

Warren Buffett: Do I hear a second?

Unidentified Speaker: I second the motion.

Warren Buffett: The motion is carried. The next item of business is to elect directors. I recognize Ms. Debbie Bosanek to place a motion before the meeting with respect to election of directors.

Debbie Bosanek: I move that Warren Buffett, Charles Munger, Gregory Abel, Howard Buffett, Stephen Burke, Kenneth Chenault, Susan Decker, David Gottesman, Charlotte Guyman, Ajit Jain, Thomas Murphy, Ronald Olson, Walter Scott, and Meryl Witmer be elected as directors.

Unidentified Speaker: I second the motion.

Warren Buffett: It has been moved in second of that Warren Buffett, Charles Munger, Gregory Abel, Howard Buffett, Steve Burke, Ken Chenault, Susan Decker, David Gottesman, Charlotte Guyman, Ajit Jain, Tom Murphy, Ron Olson, Walter Scott, and Meryl Witmer be elected as directors. The nominations are ready to be acted upon. Mr. Jaksich, When you're ready, you may give your report.

Dan Jaksich: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast not less than 543,203 votes for each nominee. That number exceeds a majority of the number of the total votes of all class A and class B shares outstanding. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

Warren Buffett: Thank you. Mr. Jaksich. Warren Buffett, Charles Munger, Greg Abel, Howard Buffett, Steve Burke, Ken Chenault, Susan Decker, David Gottesman, Charlotte Guyman, Ajit Jain, Tom Murphy, Ron Olson, Walter Scott, and Meryl Witmer have been elected as directors. And Ken, if you're watching or listening... Ken Chenault, our new director, actually got the highest vote of all the directors, well ahead of me I might add, so congratulations Ken. The next item on the agenda is an advisory vote on the compensation of Berkshire Hathaway's executive officers. I recognize Miss Debbie Bosanek to place a motion before the meeting on this item.

Debbie Bosanek: I move that the shareholders of the company approve on an advisory basis the compensation paid to the company's named executive officers as disclosed pursuant to item 402 of regulation SK, including the compensation discussion and analysis, the accompanying compensation tables, and the related narrative discussion in the company's 2020 annual meeting proxy statement.

Unidentified Speaker: I second the motion.

Warren Buffett: It has been moved and seconded that the shareholders of that company approve on an advisory basis the compensation paid at the company's named executive officers. Mr. Jaksich, when you are ready you may give your report.

Dan Jaksich: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast not less than 519,750 votes to approve on an advisory basis the compensation to the company's named executive officers. The compensation paid to the company's named executive officers. That number exceeds a majority of the number of the total votes of all class A and class B shares outstanding. Certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

Warren Buffett: Thank you Mr. Jaksich. The motion to approve on an advisory basis the compensation paid at the company's named executive officers has passed. The next item on the agenda is an advisory vote on the frequency of shareholder advisory vote on compensation of Berkshire Hathaway's executive officers. I recognize Miss Debbie Bosanek to place a motion before the meeting on this item.

Debbie Bosanek: I move that the shareholders of the company determine on an advisory basis the frequency whether annual, biennial, or triennial, with which they shall have an advisory vote on the compensation paid to the company's named executive officers as set forth in the company's 2020 annual meeting proxy statement.

Unidentified Speaker: I second the motion.

Warren Buffett: It's been moved and seconded that the shareholders of the company determine the frequency with which they shall have an advisory vote on compensation of named executive officers with the option being every one, two, or three years. Mr. Jaksich, When you were ready, he may give you a report.

Dan Jaksich: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening, cast 131,443 votes for a frequency of every year, 2,228 votes for a frequency of every two years and 419,984 votes for a frequency of every three years of an advisory vote on the compensation paid to the company's named executive officers. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

Warren Buffett: Thank you, Mr. Jaksich. The shareholders of the company have determined on an advisory basis that they shall have an advisory vote on the compensation paid to the company's named executive officers every three years. Now we're through with sort of the boiler plate resolutions in this. This next item is of more importance, and we have put up on the berkshirehathaway.com site some material relating to this motion, which I hope shareholders and others read, because it's important and it's, well, I'll describe it as the script says. The next item of business is a motion put forth by the boards of trustees of the New York City Employees' Retirement System, the New York City Teachers' Retirement System, the New York City Police Pension Fund, the New York City Fire Pension Fund, collectively called the systems. The motion is set forth in the proxy statement. The motion requests that the company adopt the policy from proving board and top management diversity. The directors have recommended the shareholders vote against the proposal. I'd like to interrupt the script here just a second to point out that when we saw that it would be impossible to have shareholders attend this meeting, and traveling to Omaha and gathering... And gatherings which really neither the governor, the mayor, the public safety people thought would be advisable.

We were hoping to have somebody from the controller's office come and present the motion and then have a good discussion at the meeting of the pros and cons, because it's a seriously important subject. And I can tell you on a personal basis, I think I'm in sync with the controller in terms of how he wants the world to evolve. But I disagree on the specifics of this motion as applied to more generally and to Berkshire's board in particular. And we've been very outspoken over the years. We've probably written more on qualifications for directors than probably any public company I can think of. And we've been consistent over the years, and we've explained the reasons for our position, and we know a great many people disagree with that position. So I welcomed the idea of really presenting to our meeting and having our shareholders hear what they had to say, and evaluate what our thoughts were.

And when we had to essentially not allow shareholders at the meeting, we immediately got in touch with the controller's office, and we said we'd make an exception if anybody from the controller's office wanted to come out and present the proposition or the proposal and engage in our discussion of the pros and cons. And as you might expect, they were not in a position to send somebody. So we offered... We may have made it even in the first place. We'd be glad to have somebody introduce the motion on their behalf, and that we would also, if they would send along a supporting statement, we would be glad to have the person that was their proxy in effect present the motion. We'd be happy to have them read the supporting statement, and we said we'd appreciate it if they keep it to five minutes or less.

And they wrote back immediately, or emailed back immediately, and said that they'd be delighted to do it that way and they'd even try and keep it down to three minutes. So they have sent a supporting statement, which is going to be read to you in a minute, and I'm glad they did it. I do hope shareholders will, or have already, and others will read. We'll listen to what the supporting statement says, and we'll also read the original arguments that they made in the proxy for their proposal, and they will read our reasons for voting against... That suggest voting against, because it's an important topic. And I really hope that next year, if somebody from the controller's office wishes to come out, we'd be glad to have even a more fulsome discussion of the subject. So with that, I will now recognize Mr. Hamburg to read a statement prepared by the controller of the city of New York in support of the motion.

Marc Hamburg: Thank you. Mr. Chairman, members of the board, fellow share owners. I'm Marc Hamburg from Berkshire Hathaway, and I'm here to present proposal four on behalf of the New York City comptroller Scott Stringer and the New York City pension funds. The funds have approximately \$211 billion in assets as of February, and our substantial longterm Berkshire Hathaway share owners with 2.5 million shares. Our proposal requests that Berkshire Hathaway board adopt a diversity search policy

requiring that the initial candidates from which new director nominees and external CEOs are chosen include qualified female and racially or ethnically diverse candidates.

First of all, we would like to commend the directors for the addition of Mr. Kenneth Chenault and the fact that 21% of the board is made up of women. We would also like to recognize that the executive pipeline includes diverse candidates including Mr. Ajit Jain, another board member. Secondly, we applaud Mr. Buffett's recognition that women in the boardroom have historically been rare, and even more importantly that although women won the right to have their voices heard in a voting booth a century ago, attaining similar status in a board room remains a work in progress.

With our share owner proposal, what we are seeking is to nudge this particular process forward. Thirdly, one of the things that Mr. Buffett mentions is that he only buys businesses that have three criteria, the second of which is able and honest managers, and that the most important duty for a board is to find and retain a talented CEO. We would note that in reviewing Berkshire Hathaway's largest stock market holdings of businesses, all 10 of these companies have boards that meet our board diversity requirement. In essence, the companies that Berkshire Hathaway is found fit to invest in are those that have more diverse boards. Fourthly, we would like to clarify that through this shareholder proposal, we are not asking for the Berkshire Hathaway board, our guardians, to have a quantifiable end result in terms of its composition, but that an initial pool of candidates for a board seat include a woman and another individual who is racially or ethnically diverse.

We believe these candidates, if qualified, would also have very high integrity, business-savvy shareholder orientation, and a genuine interest in the company. According to a 2016 Harvard Business Review study, including more than one woman or a member of a racial minority in a finalist pool helps combat the unconscious biases amongst interviewers, and increases the likelihood of a diverse hire. What we are requesting is a small step in that direction to include diverse candidates at the beginning of the search. Finally, we would like to applaud Berkshire Hathaway's robust internal CEO succession plans. Our proposal states that a CEO diversity policy should only apply in the case of an external search. The New York City comptroller's office is disappointed that we never had the opportunity to discuss our proposal with directors or management, but remain open to constructive engagement. In the interim, we strongly urge Berkshire Hathaway share owners to support proposal four. Thank you.

Warren Buffett: Okay, thanks Marc, and thank you to the comptroller for presenting that supporting statement. The motion is now ready to be acted upon. Mr. Jaksich, when you are ready, you may give your report.

Dan Jaksich: My report is ready. The ballot of the proxy holders in response to the proxies that were received through last Thursday evening cast 65,925 votes for the motion, and 485,824 votes against the motion. As the number of votes against the motion exceeds a majority of the number of votes of all class A and class B shares properly cast on the matter, as well as all votes outstanding, the motion has failed. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

Warren Buffett: Thank you Mr. Jaksich. The proposal fails.

Debbie Bosanek: I move that this meeting be adjourned.

Unidentified Speaker: I second the motion to adjourn.

Warren Buffett: The motion has been made and seconded. The meeting is adjourned. So thank you.

Q&A Session – 2020 Meeting (Virtual)

Warren Buffett: I've just looked at my watch, and I talked a lot longer than I should have probably. That's not a unique experience of mine that just occurred. So now we're ready to have questions, which Becky quickly selected from those that's been forwarded to her directly and from Carol Loomis and Andrew Ross Sorkin, and Greg and I are available to be... We'll be answering them for some time. So Becky, you're on, and I hope, all the tech... I hope everything works.

Becky Quick: Yeah, Warren, I should tell you that since you put that address up on the screen, I've gotten more than 2,500 emails that have been coming in. So there is a lot of demand from shareholders wanting to get in and ask questions, and I'll ask some that we've compiled before and some that are coming in right now. The first question though comes from one that just came in based on the comments that you were actually saying. This is a question that comes from William Lewis. He said, "Please, did I understand correctly Mr. Buffett, to say that Berkshire Hathaway sold its interest in four different airlines and if so, can you name them? Can the names of those airlines be identified?"

Warren Buffett: Yeah. I wouldn't normally talk about it, but I think it requires an explanation, and it requires an explanation that means we were not disappointed at all in the businesses that were being run and the management, but we did come to a different opinion on it. They're the four largest US airlines, that's American Airlines, and Delta Airlines, and Southwest Airlines, and United Continental. And I think collectively they probably, or at least 80% of the revenue passenger miles that is flowing in the United States. And they have significant international flying too, excluding Southwest. So we like those airlines, but we don't... The world has changed for the airlines, and I don't know how it's changed, and I hope it corrects itself in a reasonably prompt way. I don't know whether the Americans will have now changed their habits or will change their habits because of an extended period if it happens that we're semi shut down in the economy.

I don't know whether the trends toward what people have been doing by phone. I mean, it's been seven weeks since I've had a haircut. It's been seven weeks since I... More than seven weeks since I put on attire. They think I've been... Just a question of which sweatshirt I wear. So who knows how we come out of this. But I think that there are certain industries, and unfortunately I think the airline industry among others, that are really hurt by a forced and in fact shut down by events that are far beyond their control. Greg, would you like to add anything to that?

Greg Abel: Really nothing to add, Warren.

Warren Buffett: Okay. We got another Charlie here.

Greg Abel: I didn't intend to use that as a line. But you've covered it well.

Warren Buffett: We would have bought other airlines, too, incidentally, but those were the four big ones. Those were the ones we could put some money into and we put whatever it was, seven or eight billion into it. And we did not take out anything like seven or eight billion. And that was my mistake. But it's always a problem if there are things on the lower levels of probabilities that happen sometimes, and it happened to the airlines. And I'm the one who made the decision.

Becky Quick: But Warren, just to clarify on his question. He asked, "Did you sell your whole stake in all four of those companies?"

Warren Buffett: Oh, yeah. The answer is yes. Yeah. When we sell something, very often it's going to be our entire stake. I mean we don't trim positions. That's just not the way we approach it any more than if we buy a hundred percent of a business, we're going to sell it down to 90% or 80%. I mean, if we like a business, we're going to buy as much of it as we can and keep it as long as we can. Well, when we change our mind... Go ahead, I'm sorry.

Becky Quick: All right, the next question... No, go ahead. When you change your mind?

Warren Buffett: Well, when we change our mind, we don't take half measures or anything of the sort. So I was amazed at how frankly... Now, we were selling them at far lower prices than we paid. But I was amazed at the volume there. Airlines always trade in large volume relatively, but we have sold the entire positions.

Becky Quick: Okay. Thank you. The next question comes from Robert Tomas from Toronto, Canada, and he says, "Warren, why are you recommending listeners to buy now, yet you're not comfortable buying now as evidenced by your huge cash position?"

Warren Buffett: Well, A, as I explained, the position isn't that huge. When I look at worst case possibilities, I would say that there are things that I think are quite improbable. And I hope they don't happen, but that doesn't mean they won't happen. I mean, for example, in our insurance business, we could have the world's, or the country's, number one hurricane that it's ever had, but that doesn't preclude the fact that could have the biggest earthquake a month later. So we don't prepare ourselves for a single problem. We prepare ourselves for problems that sometimes create their own momentum. I mean 2008 and 9, you didn't see all the problems the first day, when what really kicked it off was when the Freddie and Fannie, the GSEs went into conservatorship in early September. And then when money market funds broke the buck... There are things to trip other things, and we take a very much a worst case scenario into mind that probably is a considerably worse case than most people do.

So I don't look at as huge, and I'm not recommending that people buy stocks today or tomorrow or next week or next month. I think it all depends on your circumstances, but you shouldn't buy stocks unless you expect, in my view, you expect to hold them for a very extended period and you are prepared financially and psychologically to hold them, the same way you would hold a farm and never look at a quote and never pay... You don't need to pay attention to them. I mean, the main thing to do... And you're not going to pick the bottom, and nobody else can pick it for you or anything of the sort. You've got to be prepared when you buy a stock to have it go down 50% or more and be comfortable with it, as long as you're comfortable with the holding.

And I pointed out, I think a year, maybe two years ago on the annual report... Just the one before this most recent one, I pointed out that there had been three times in Berkshire's history when the price of Berkshire stock went down 50%. Three different times. Now if you hold it on borrowed money, you could have been cleaned out. There wasn't anything wrong with Berkshire when those three times occurred. But if you're going to look at the price of the stock and think that you have to act because it's doing this or that, or somebody else tells you, "How can you stay with that," when something else is going up or anything. You've got to be in the right psychological position. And frankly, some people are not really careful. Some people are more subject to fear than others.

It's like the virus. It strikes some people with a much greater ferocity than others. And fear is something I really never felt financially, but I don't think Charlie's felt it either. But some people can handle it psychologically. If they can't handle it psychologically, then you really shouldn't own stocks, because you're going to buy and sell them at the wrong time. And you should not count on somebody else telling

you this. You should do something you understand yourself. If you don't understand it yourself, you're going to be affected by the next person you talk to. And so you should be in a position to hold, and I don't know whether today is a great day to buy stocks. I know it will work out over 20 or 30 years. I don't know whether it'll work out over two years at all. I have no idea whether you'll be ahead or behind on a stock you buy on Monday morning, or the market.

Becky Quick: Warren, the next question comes from Scott Kelly, and he writes in based on the numbers you just put up. He said, "What did you spend the \$426 million on equities in April? Was that adding to existing positions, or was that initiating new positions?"

Warren Buffett: Well, I don't remember to tell you the truth, but one thing you have to allow for... Well, these are the figures for Berkshire Hathaway, and they include both Todd Combs and Ted Weschler

Both Todd Combs and Ted Weschler, managed significant sums of money. So it could well be something they bought. It could be something I bought. 462 million is not much money at Berkshire. It's more to Todd and Ted than it is to me in terms of our positions.

But I literally have no memory of. We're not doing anything big obviously. We're willing to do something very big. I mean, you could come to me on Monday morning with something that involved 30 or 40 billion or \$50 billion, and if we really liked what we were seeing, we would do it and that will happen someday.

If it happens in the market, we can't put it all in on one day or one week or one month. It took us months to build up our airline position. Many months. We were able to sell them faster than we bought them, but we were selling them at lower prices. So the 462 is essentially meaningless and it may not have even, probably was not mine.

Becky Quick: All right. This next question comes from Leanne Dar, and his question is, "In the last financial crisis, Berkshire acted as a lender of support for eight different deals. Despite the injection of expensive capital through preferred stocks and securing warrants, these companies were in fact paying for the sign of confidence from Berkshire in the midst of a crisis and that was invaluable. Today we have QE, infinity, low interest rates, and hungry hedge funds, even though the economy has deteriorated rapidly over the last few months. Why have we not acted as a lender of support?"

Warren Buffett: Well, we haven't seen anything attractive. And frankly, wasn't predicated on this, but the Federal Reserve did the right thing and they did it very promptly, which they should have and I salute them for it. But that means that a lot of companies that needed money and probably should have done their financing a little earlier, but they're perfectly decent companies, got the chance to finance in huge ways in the last five weeks or thereabouts.

I mean it's set records. Some companies have come back twice, a number of very big companies that hadn't bothered him to extend out their borrowings. Came a couple times. Berkshire actually raised some more money. We don't need it, but I think it's still a good idea over time.

And then there are some pretty marginal companies that have also had access to money. So there is no shortage of funds at rates which we would not invest at.

So we have not done anything because we don't see anything that attractive to do. Now, that could change, very quickly or it may not change. But in 2008 and 2009, the truth is we weren't buying those things to make a statement to the world. They may have made a statement to the world to some extent, and I'm glad that they did if they did, but we made them because they seemed intelligent things to do and

markets were such that we didn't really have much competition. Now it turned out that we would have been a lot better off if we'd waited four or five months to do similar things.

So my timing was actually terrible in 2008 or 2009 but what was available was so attracted that even though my timing was terrible, we still came out okay. Or a little bit better than okay.

But what we did was not designed to make a statement. It was designed to take advantage of what we thought were very attractive terms, but they were terms that nobody else was willing to offer at that time because the market was in a state of panic. And the market in equities was in a state of panic for a short period of time when the virus broke out or spread in the United States. And it became apparent and the debt market was frozen, or in the process of freezing, and that changed dramatically when the Fed acted. But who knows what happens next week or next month or next year? The Fed doesn't know. I don't know. And nobody knows.

There's a lot of different scenarios that can play out and under some scenarios we'll spend a lot of money and other scenarios, we won't. Greg, you've been watching what's been happening around Berkshire.

Greg Abel: Yeah. Yeah. Well I think your comment on the Fed, Warren has interestingly when it was first occurring, there were calls coming in. Not the size of transactions we're interested in nor companies we were inclined to act upon. But there was that general interest out there as people were in a difficult point in time. Looking at their balance sheet and deciding what they were going to do.

But the reality is those companies were not of interest and post basically effectively March 23rd, the companies have been able to act. And Warren touched on it, at Berkshire Hathaway energy post the Fed action, we actually issued \$4 billion of securities that was associated with debts or obligations. We had maturing some short term obligations we wanted to clearly lengthen out, and we pre-funded one of our capital programs at Pacific Corp. with the thought this was the time to get the funds in place such that we could proceed with what is really an excellent opportunity both for Pacific Corporate customers and ultimately for the Berkshire shareholders.

So we've taken action within Berkshire as Warren noted.

Warren Buffett: This is a very good time to borrow money, which means it may not be such a great time to lend money, but it's good for the country that it's a good time to borrow money.

Not good for Berkshire particularly. Although we borrowed some money. So we've put our money where our mouth is.

Becky Quick: That gets kind of to another question that came in from Mark McNicholas in Chicago, Illinois. He says, "Berkshire itself as a Fort Knox like balance sheet, but some of its operating companies may be tight on cash during the pandemic. Would Berkshire consider sending cash to its operating companies to one, ensure that they can get through the pandemic and and two, allow them to increase market share while their competitors struggle?"

Warren Buffett: Well, we've sent money to a few and we're in a position to do that. We're not going to send money indefinitely to anything where it looks like their future is not. It's changed dramatically from what it was the year or so ago or just even six months ago. You know, we made that decision in terms of the airline business. We took money out of the business basically even at a substantial loss, and we will not fund a company that where we think that it's going to chew up money in the future.

We started out with a company like that in our textile business at Berkshire Hathaway in 1965 and we went for 20 years trying to think we could solve something that wasn't that solvable. So we are not in the

business of subsidizing any companies with shareholders money. If people want to do that with their own money, but we're not going to do it on their behalf. But we have advanced money, we are perfectly ready to advance money.

Gaining market share and all that. That may happen, but the companies that need money probably, market share is not their number one problem. I'll put it that way. Greg, would you?

Greg Abel: Yeah. Well yeah. It's interesting when we look at our different companies as we went into the pandemic or we're addressing the COVID 19 crisis. Obviously the first focus by our management team and appropriately was our employees and effectively making sure they're safe and that the business environment we're in, that they could continue to operate. Then we quickly moved to looking at where our customers were in the cycle, I.E. What was the underlying demand within the business? And to great credit to our managers, they very much have adjusted their businesses consistent with the underlying needs and demands of our customer.

So effectively they're moving with the customer, meaning very few of our businesses have actually required funds. Some have. And as Warren said, we've advanced the funds to them, but the businesses have really reacted in a way where they're managing consistent with where the market's at. I.E., the demand for their products.

Warren Buffett: Berkshire is almost certain to generate cash. I mean nothing's a hundred percent certain, but as Greg mentioned at Berkshire Hathaway energy, we had some short term financing. We don't have short term financing to any degree. We'll never get ourselves in a position where we have a lot of money that can come due tomorrow. And people that were financing heavily with commercial paper and then found their business stopped. Well you've seen what's happened to the airlines. I mean they need money. Cruise lines need money.

There's some businesses that, it's just the nature of what they're in. Berkshire will never get it in a position where it needs money. And we factor in, like I said, we factor in some things that are not ridiculously unlikely. And I'm not going to spell out scenarios because I, to some extent, you start spelling out scenarios, you may increase the chance of them happening. So it's not something that we really want to talk about a lot, but our position will be to be to stay a Fort Knox.

But we don't need it. We don't need a hundred and, it's a little higher now than it was at quarter end. We don't need 130 or 35 billion, but we need a lot of money that's always available. And that means we own nothing but treasury bills. I mean, we've never owned, we never buy commercial paper. We don't count on bank lines and a few of our subsidiaries have them, but we basically want to be in a position to get through anything. And we hope that doesn't happen but you can't rule out the possibility anymore than in 1929 you could rule out the possibility that you know you would be waiting until 1955, or the end of 1954, to get even. Anything can happen and we want to be prepared for anything, but we also want to do big things.

If the prices are attractive. As Greg said, there was a period right before the Fed acted. We were starting to get calls. They weren't attractive calls, but we were getting calls and the companies we were getting calls from after the Fed acted, a number of them were able to get money in the public market. Frankly terms we wouldn't have given it to them.

Becky Quick: All right. This next question is one that Greg, you actually touched on the answer to this to some extent, but maybe the two of you could expand on it. It comes from Richard Sourcer from Tucson, Arizona. He says, "Berkshire's annual report indicated the Berkshire had 391,539 employees at the end of

2019. Which areas of our operations have already been hardest hit or will be by the coronavirus pandemic? And what are the implications for the continued employment of those people?”

Warren Buffett: Those people are employed in dozens and dozens of different industries. And there are a few industries that there’s a fair likelihood that our employment could be reduced, but they’re not large.

I’m just thinking as I’m talking, it’s not like we’re in some of the businesses that are, we’re not in the hotel business. Various aspects of travel and entertainment and all of that could really be changed in a very major way.

So I don’t see our employment. I’ll put it this way, five years from now, I think Berkshire will be employing considerably more people, and I don’t see where we’ll have large dips, but the virus could take off in certain ways, that in some of our manufacturing businesses for example, the demand could be dramatically reduced. And in those cases, we would have layoffs at some point. Greg?

Greg Abel: What I would add, Warren, is that as we are in the sort of crux of the pandemic, we’re still dealing with it. So our businesses have adjusted. Some have had to adjust more.

If you look at Berkshire Hathaway energy, for example, you can see US electricity consumption is down 4%. That realistically doesn’t impact our business in a significant way. And in longer term we’ll continue to grow that business. So even during the crisis, a relatively small impact to the business.

But as Warren knows, we do have retailers that their doors are shut right now, be it our See’s Candy, some of our jewelers. And at that point in time, we do adjust and adapt to the environment. We adjust our workforce. But equally we do see for example, See’s at a point our stores will reopen. And at that point, we reemploy the folks.

And overall for Berkshire as a whole, as Warren said, five years from now, we see our employment numbers being far greater than they are today. And that we see great prospects within the operating businesses as a whole.

Warren Buffett: See’s is an interesting example because we’ve owned that since 1972. That’s a long time and we love it and we continue to love it. And I have a box here of our peanut brittle and I’ve got another box of fudge right here and I’ll probably take them all home and not share with Greg.

But we were in the midst of our Easter season and Easter is a big sales period for See’s. And I don’t know whether we were halfway through, but we weren’t halfway through in terms of the volume is going to be delivered because it comes toward the end. And essentially we were shut down and we remain shut down. The malls that we’ve got 220 or so retail stores and we’ve got a lot of, Furniture Mart sells our candy. But the Furniture Mart’s closed down. And so See’s business stopped and it’s a very seasonal business to start with. So we have a lot of seasonal workers too that come in, particularly for the Christmas season. But we have a lot Easter candy, and Easter candy is kind of specialized too. So we won’t sell it. And we produced a good bit of it. We couldn’t ship it, we couldn’t put it in stores and there’s some of that going on.

And then of course, Greg does all the work on those sort of situations and our managers are terrific of course. And in dealing with it, but this is a very, very unusual period. And like I say, a few years from now, I think Berkshire will be employing more people than 395,000. Over the years, we started with 2000 of the textile business, and we’ve still got the same playbook.

Becky Quick: This next question comes from Drew Johnson who says that he’s a longtime shareholder who’s attended a couple of meetings. He says, “In an interview on April 17th, Charlie mentioned that

some small businesses owned by Berkshire would not reopen after the pandemic eases. Can you elaborate on which businesses might be impacted?"

Warren Buffett: We have businesses within businesses. At Marmon don't we have 97 different businesses, for example?

Greg Abel: Exactly. Yep.

Warren Buffett: Yeah. And there are some that's weren't doing that well before and I'm not talking about Barman Spivey, but they got a couple of them and there's a couple of them. And it may be that in effect, what's happened in the last couple of months has accelerated the decline and of those businesses or their customers are developing different habits. People are developing different habits in retail. There's no question about that. Now that doesn't mean we haven't got a bunch of good retail businesses, but there are businesses that were having problems before and that have even greater problems now. We don't own our newspapers anymore, but we're financing the enterprise which does have them. We've actually increased our investment in the newspaper business by selling the papers to Lee and then refinancing their debt. And the newspaper business was having plenty of problems with both circulation and advertising before the buyers came along.

But advertising declines every place. Have accelerated fairly dramatically. And when the automobile industry stops, the auto dealers don't advertise it. It's made certain businesses that were tough before even tougher now. And there will be management of at least one of the subsidiaries is suggested to us. And so there'll be some changes in a few businesses, but they're very small businesses.

Our major businesses and our business of intermediate size, I can't think of anything that's of significance that won't reopen, but it won't be any fun with the businesses where the world has really changed. You're seeing a lot of change.

If you own a shopping center, you've got a bunch of tenants that don't want to pay you right now. And the supply and demand for retail space may change fairly significantly. The supply and demand for office space may have changed significantly. A lot of people have learned that they can work at home or that there's other methods of conducting their business than they might've thought from what they were doing a couple of years ago. And when change happens in the world, you adjust to it.

Greg Abel: Yeah. I think the, oh, go ahead.

Warren Buffett: Becky, I think Greg, one. Yeah.

Becky Quick: This next question is a follow up one.

Greg Abel: Well, I was just going to add on the Marmon example, our 97 companies there. For example, we have a food service group which sells equipment to a variety of the restaurants. We have a few businesses that realistically were challenged when the industry was performing really well. And as we come out of the crisis, their economic prospects aren't going to be better. And in fairness to the teams and the employees in there, they understand that and they're working through it and there'll be other opportunities potentially within the company, within Marmon, and things like that. But there's a very specific answer or example relative to the question.

Becky Quick: This next question is a followup on that. It comes from Chris Fareed of Philadelphia. And he says, "It's been a longterm policy of Berkshire to not sell or close any ongoing subsidiaries as long as their business prospects weren't a money hole." Over the last year, he points out the sale of Berkshire Hathaway media. And then Charlie's comments from that interview saying that several small Berkshire

subsidiaries will not be opening when the coronavirus lockdown is lifted. “So should shareholders assume that Berkshire has now changed its longterm policy in regards to keeping underperforming subsidiaries around?”

Warren Buffett: I think that policies were spelled out for maybe 30 years or so. An addendum in the annual report that we have said that if a company, or if an operation, we think that its prospects are that it will continually lose money in the future, that we’ll try to sell it to somebody else. But one way or another we will not continue to hold it.

And that that is not a new policy and it’s not been changed. You can say in effect, we did that with the airline industry to some extent. If we owned all of an airline now, it would be a tough decision to decide whether to sustain billions of dollars in operating losses when you don’t know how long it’s going to happen or occur. And secondly, you know that it’s very likely that there’ll be too many planes around.

And we know what happens in airline pricing, when load factors go down and there’s an oversupply of airline seats. So we didn’t have to make that decision in terms of our own operation on it, but we did make a decision that that’s a very tough management decision to make. And the government of course is as well, they’ve had the first wave of financing for the airlines.

But to the airlines credit, they have very aggressively raised money. I mean it’s amazing to me what a good job they’ve done of that. And I think in the case of three of them, no, two of them, but there may be more coming, that they’ve raised equity money too. They are saying that the debt holders and investors, you’ve got to put more money into this business if we’re going to be able to continue. And the government’s done it. And private sources have done it and it’s exactly the right thing for the managements to be doing. But whether it makes sense, we’ll find out for the investors.

Becky Quick: This next question comes from Eric LaFont and it’s directed to Greg. He asks, “How is Precision Castparts handling the severe slowdown in the aerospace industry?”

Greg Abel: So very consistent with everything we’ve just discussed, which is obviously a large part of their business is the aerospace industry, and it can really be broken into three areas as we do in our queue, but two are being impacted.

The defense contract business remains very sound and strong within Precision Castparts, but if you look at the large body aircraft, the aircraft that they use within the regional jets, that business will move directly with the demand there. And the jets that are ordered longer-term. So Precision Castparts is literally as we speak, continuing to adjust their business relative to the demand that would come out of Boeing.

They would be having weekly calls with Boeing, recognizing what are their production orders there and adjusting the business accordingly.

Warren Buffett: Boeing raised 25 billion just a day or two ago, and they raised 14 billion before that. And a year ago they felt they were in a fine cash position. And I understand not all that happened.

Airbus has had the same situation. They’ve made some comments reasonably within the last week. The fact that they really don’t know what their future is, and I don’t know what their future is. We’re going to have aircraft in this country, we’re going to be flying.

But the real question is whether you need a lot of new planes or not. And when you’re likely to need them. And it affects a lot of people and it certainly affects Precision Castparts. It affects General Electric.

It obviously affects Boeing and it is a blow to essentially have your demand dry up and it goes up the chain.

And the aircraft manufacturers didn't bring it on themselves. The airlines didn't bring it on themselves. Precision Castparts didn't bring it on itself. General electric didn't. It's basically that we shut off air travel in this country, and what that does to people's habits and how they behave in the future. it's just hard to evaluate.

I don't know the answer, but we do know that will have an effect on Precision Castparts. And how severe it will be depends on this same sort of variables that are hitting Boeing. Then you name the company in aircrafts. And aircraft is a big business. And this country is good at it incidentally too.

I mean if you think about Boeing, it is one hell of a company and and it's important. It's a huge exporter and it affects a lot of jobs and some of them are with us. We hope for the best and we wish everybody the best. Obviously and we wish ourselves the best in it, but part of it is certainly out of our control.

Greg Abel: Right.

Becky Quick: This next question is for Warren. And "Do you think Geico will experience unusually high profitability in 2020 due to the reduced amount of driving, even after giving customers a 15% credit?"

Warren Buffett: We have promised to give our customers, at Geico we're the second largest auto insurance company and different auto insurers are handling a sharing of the better experience with their policy holders in different ways.

Our plan will deliver back two and a half billion roughly or so. And in recognizing the reduced frequency of accidents during this period, what we don't know is how long this will continue. I mean people want to drive their cars still, but conditions have reduced that driving dramatically obviously.

Now, we have instituted a program that runs saving people money for six months and so far other people have largely been two months, but some of them have given a little more for those two months than we get per month. Our total is the greatest at two and a half billion.

And in addition to that, we and all the others in the industry, it's not just Geico, and insurance commissioners in many cases. I believe their required it, but we get people more time to pay if they aren't paying, and if they canceled our policy or if they don't end up paying us, we've in effect giving them free insurance during that period. And the delay in payments is obviously increased.

Delay of payments on, if you've got of a shopping center getting rent, if the delay in payments is what happens during a period like this, and that will be a significant cost to us. We don't know how significant it will be.

There will be more uninsured motorist driving and they cause a disproportionate amount of accidents and that. So there's a lot of variables. We made our best guess as to what we're going to do to reflect the current reduced accidents in our premiums that we receive, really over the next year. It applies for a six month on renewals, but that we'll be renewing policies in October that will extend it. Then next April, and so we've made a guess on it and we'll see how it works out.

Becky Quick: This next question comes from Steven Staller. He's a shareholder in Atlanta, Georgia and he says, "Would you please help us understand the effects of COVID-19 are on our insurance businesses? Other insurance companies have reported losses from boosting reserves for future insurance claims that they expect to be paying as a result of Coronavirus. Yet in Berkshire's 10Q released this morning, we do

not appear to have reported much of these future expected losses. Can you tell us why this is the case? What kind of risks Berkshire is underwriting that allows us not to be affected by the pandemic or conversely, what we are writing that might be?"

Warren Buffett: Well, the amount of litigation that is going to be generated out of what's already happened, let alone what may happen, is going to be huge. Now, just the cost of defending litigation is huge, enormous expense, depending on how much there is.

Now, in the auto insurance field, which is our number one field in terms of premium volume by some margin, that's more definable, but who knows what comes out of it in terms of litigation. But in what they call commercial multiple peril, which involves property losses and where some people elect to buy business interruption experience coverage, many policies quite clearly in the contract language would not have a claim for business interruption under a commercial multiple peril policy where you've elected that. But other policies do I know of, I think I know of one company. I don't know the details, that's written a fair amount where they cover or they certainly there's a good argument perhaps that they cover business interruption that might arise from a pandemic.

Well, they're in a very different position than the standard language which says that you recover for business interruption only if involves physical damage to the property. And you can buy all kinds of different policies. We are not big in the commercial, multiple peril business.

So I mean, this is not like our auto business or anything of that sort, but we will have claims. We'll have litigation costs, but proportionally it's not the same with us as with some other companies, which have been much more...

...those with some other companies which have been much heavier in writing business interruption as part of a commercial, multiple peril. But you don't automatically get coverage if you have business interruption. I mean for example, I think it would be unusual if say General Motors had a strike, which they did, and that they have business interruption that covers a strike. We actually wrote about, probably the only annual report in the United States, we wrote about business interruption insurance because we had it over in France, when one of our properties was adjacent to a much smaller property that had a fire and then it spread to our plant and it caused a lot of physical damage and we have business interruption that ties in with that. But if we had some company we were selling auto parts to and they had a strike, our business would be interrupted, but that is not part of the coverage, unless you specifically really buy it. So, there's some claims that are going to be very valid and related to the present situation. There'll be an awful lot that there'll be litigation on that won't be valid.

And, there's no question that some insurance companies, I know one particular, that will pay a lot of money relative to their size, in terms of policies that they've written. And I think we have reserved, and our history shows we generally have reserved on the conservative side, adequately at least. And that's certainly our intent. And we tell no managers of any of our insurance operations, what numbers we expect from them or do any of that. They evaluate their losses and they build in something for social inflation. They build in things for all kinds of things. And generally speaking, Berkshire has been pretty accurate in its reserving. And, I have no reason to think that we're otherwise than that, currently.

Becky Quick: [Steven Tedder] From Atlanta who says he's a tenured Berkshire shareholder writes in and he says, do you see Berkshire offering pandemic coverage in future insurance policies?

Warren Buffett: Well the answer is, we ensure a lot of things. Sure. We had somebody come to us the other day wanting insurance involving a \$10 billion protection on something very unusual. We're not

going to make that deal in all probability. In fact, I would say it's dead. But we would have written pandemic insurance if people had come to us and offered us what we thought was the right price. We would have been wrong, probably in doing it. But, we have no reluctance to quote on very unusual things and very big limits. We're famous for it. We haven't done that much of it in certain periods because the prices aren't right. But if you want to come and insure almost anything, and we don't want you to insure against fire if you happen to be a known arsonist or something. But, if you come to us with any unusual coverages, either in size or in the nature of what's covered, Berkshire is a very good place to stop. And so, somebody wants to buy, they can dream up the coverage and they can tell us the price they'll pay, and we'll consider writing it.

We wrote a lot of business after 9/11 for example. And there were really only a couple companies in the world that were willing to write the business. And Berkshire and AIG wrote a lot of business and we thought we knew what we were doing but we could have been surprised. I mean there could have been some follow on incidents from 9/11 that we wouldn't have known about. You don't know for sure the answer. That's why people are buying insurance. But, we would be willing to write pandemic coverage at the right price.

Becky Quick: This next question is for Greg and it comes from a shareholder named [Todd Flaska]. He says, "I don't expect Berkshire to outperform the S&P500 during good times. However, I remain a longterm investor because of the huge war chest that can be deployed during the downturns in the market, like we're seeing right now. Warren has been brilliant at negotiating mutually favorable deals with companies that have somewhat urgent capital needs during these down-times. These opportunities may only come about once a decade. There's a small window of time for these deals. They all come at once and you don't really know if you're at the bottom of the market when the deals start coming. Will Berkshire be able to continue this approach when Warren and Charlie are no longer at the helm?"

Greg Abel: I fundamentally, without Warren and Charlie at the helm, I don't see the culture of Berkshire changing. I don't see our billet, which a large part of that is having the business acumen to understand, the transaction, the economic prospects and then, the ability to act quickly. I really don't see that changing as we... Well listen, there's no one better than Warren and Charlie, but equally we've got a talented team in Berkshire both at the Berkshire level, and within our managers that can obviously look at opportunities too, very quickly. But, the reality is it's a huge advantage we have right now, and we would clearly want to be in a position to maintain that position of strength. Warren?

Warren Buffett: Yeah, we will maintain it. And, we not only have it when the managers of the... In some cases, not all cases by a long shot, but in some cases we have managers that will occasionally come up with something that can be quite attractive. But between Greg and Todd and Ted, we've got three extraordinarily good buyers in terms of allocating capital and, I and Charlie may get an occasional call because of someone we knew 20 years ago or something. But they know a lot more people. They've got a lot more energy and their minds work the same way as ours have in the past. So I think it could very well be a significant improvement when the three of them are thinking about capital allocation, than when Charlie and I are now. Particularly now that he's found zoom.

Becky Quick: All right. This next question comes from [Max Rudolph] in Omaha, Nebraska. And he asks, if Berkshire or any of its fully own businesses have participated in any of the bailouts from the fed or the treasury?

Warren Buffett: I certainly don't know of any, I guess you could say while we own the airlines. Well no, the question is about fully owned businesses and there's no way that I wouldn't know about anybody that did any of that. Greg?

Greg Abel: No. In fact, we've been very clear with the businesses, but our businesses understood how Berkshire operates and equally we're very clear that we would not be participating in any of those programs or quote bailouts.

Becky Quick: This is a similarly related question. It comes from [Seth Frieden] who says "As a longterm shareholder of Berkshire B shares, I'd like to know Warren's viewpoint around smaller holdings, specifically Oriental Trading Company and Nebraska Furniture Mart that are based in your hometown of Omaha." He imagines that those smaller business units have been adversely impacted by COVID shelter-in-place mandates. So would like to know if Oriental Trading or other small business units applied for PPP loans or participated in those acts. And if they didn't qualify for a loan or didn't participate, then how will Berkshire support those smaller businesses to make sure that they can continue to employ their employees?

Warren Buffett: Well to my knowledge, none of them have gone in for government money. And the two that are mentioned, I don't like to get into specific companies but I can assure you that the Nebraska Furniture Mart and Oriental Trading in my view have a fine future. But, I don't want to talk about, go down the list obviously, of every single company because some of them I don't know the answer to. We actually decided some time ago that that our newspapers would have a much better chance of surviving if they were run as part of [Alee 00:09:48], than if we ran them independently. And, as I said earlier, we actually put considerably more money... We probably put more money in the newspaper business than virtually anybody in the country in the last six months. Because we took over a loan that would have been a problem in the year, whatever it might've been, maybe year and a half. And we enable them to just deal with one lender rather than a group. And they are doing a better job with the newspapers than we would do.

And that's always our preference. If we've got a business that looks like it is not going to sustain itself over time in our hands. If we can find somebody else that we think will do a better job, we'd love to have them run it. So if we have a problem business, we would prefer to find somebody that thinks they can do a better job and probably can do a better job of running than we can. But some businesses, just are superior. We started with the textile business. We started a company called diversified retailing, which merged into Berkshire, became part of Berkshire and started with a department store in Baltimore. And department stores looked good in 1966 but the world has gone against them. And we had a trading stamp business at one time, and we stayed longer than anybody else but the world left trading stamps behind. And that's going to happen with some businesses. That's capitalism. And it will happen to some Berkshire businesses over the next 10 years and the next 50 years. We think we'll find more of them that will grow. And net, that Berkshire will grow. But we do not think if you own a great many businesses that every one is destined for success. That's why I suggest to people they buy an index fund. I do not, with the exception of Berkshire, I would not want to put all my money in any one company, although there's a few, I wouldn't mind being very close to that. But, you get surprises in this world and there will be businesses that we think are very good that turn out not to be so good, and there will be other businesses that turn out better than we think and it's up to the world to judge our batting average, over time. Greg?

Greg Abel: Well I would just add and echo again, that when it comes to the PPP loans, we're not aware of any of our businesses taking them. And as I said, we encouraged them if they were ever thinking that, there was going to be a dialogue and we're not aware of any businesses pursuing them. I would also just add that when you look at our businesses as we went into the crisis, they responded very well. So as we look at our businesses, and Warren touched on this, our large businesses our mid sized businesses and even as you go down from there, they're in very sound shape as we go through the pandemic and are really preparing to emerge now.

So they're evaluating, listen, they're going to have a different customer, there's going to be different consumer behaviors, how our employees work. A lot of them work at home now, does that make sense? And the communities we're operating in have all changed. But we're literally moving from the point of, "Okay, we're, making it through the crisis" and really planning to reemerge now. And I would say our businesses are in an extremely sound place.

Warren Buffett: We don't know when the-

Becky Quick: This next question-

Warren Buffett: Well I was just gonna-

Becky Quick: Okay, go ahead.

Warren Buffett: Well we don't know. We don't know how long this period lasts. And nobody knows. Most people think, and they know more about it than I do, that the virus will, to some extent, decline in its spread during summer months. And I would say a good many think, that it will come back at some later date. And how the American public reacts if they get their hopes up through some summer diminution and how they would react to a second attack, in effect by the virus. It's like Dr Fauci... the virus is going to determine our behavior in a way. And we're doing a lot of smart things and we've got a lot of very smart people, but there are unknowns. And the unknowns that apply to the health aspect create unknowns in the economy. And we'll have to keep evaluating things as we go along. I hope, like crazy obviously, that once suppressed that it doesn't come back and that we readjust. But things don't always work perfectly. That doesn't mean there was a better course of action that would not... I would not go around criticizing people at all for what they've done or anything of the sort. I just think you're dealing with a huge unknown. And I think that the degree to which it's disturbed the world and changed habits and endangered businesses in the last couple of months indicates that you better, not be too sure of yourself about what it'll do in the next six months or year or whatever.

Becky Quick: Warren, a moment ago you mentioned that you still are recommending that people invest in an S&P500 index fund. Let me ask this question that came in from Kevin. He says "The last few weeks we've been hearing from active money managers that the day of passive investing is over. The historical safety of investing in an index fund longterm is gone. Would you please provide your thoughts on this topic, particularly in regards to an investment time span of 10 years?"

Warren Buffett: Well, I can tell you I haven't changed my will and it directs that my widow would have 90% of the funds in index funds and I think it's better advice than people are generally getting from people that are getting paid a lot to give other advice. You don't make a lot of money advising an S&P 500 index fund. And how you can say "The D day of index funds is over." I mean, if you say "The day of investing in America is over." I would disagree quite violently. And then is there's something special about index funds being a terrible way to invest, I just don't think... it's very hard to have evidence of that. I mean, if the index funds reflect the market and one side has high fees that think they can pick out stocks and the other side has low fees, I know which side is going to win over time.

And, you have to recognize that it's in a great many people's interest to convince you that they can do something, that they may well even believe they can. And a certain percentage of them will do it from luck and a few people will do it from skill. And that's what makes it so enticing that you can find the [Jim Simons 00:17:42] or somebody that's going to produce extraordinary return. And Jim and his group have done it by brainpower, but that's very unusual and incidentally they are going to charge you a lot of money and they're going to actually maybe close up their fund if they do it because they can't do it with

really huge amounts of money compared to how the record has been established in the past. Just have to recognize you're dealing with an industry where it pays to be a great salesperson and it pays even better if you're a great salesperson and you can actually produce something. But the money is in selling. There's a lot more money in selling than in managing, actually, if you look to the essence of investment management.

Becky Quick: I got a number of variations on this next question, some more polite than others. This one's right about down-the-middle. But this is from [Mark Blakely] who writes in from Tulsa, Oklahoma, and he says "Like many, I'm a proud Berkshire Hathaway shareholder. However, in comparing the performance of Berkshire with the S&P 500 over the last 5, 10 or 15 years, I've been disappointed in Berkshire's under-performance. Even year to date, Berkshire is trailing the S&P 500 by 8%. To what would you attribute Berkshire's under-performance? While I can't imagine ever selling my Berkshire stock at some point, money is money."

Warren Buffett: No, I agree with everything that, I forgot his name, but just said. I mean the truth is that I recommend the S&P500 to people. And I happen to believe that Berkshire is about as solid as any single investment can be, in terms of earning reasonable returns over time. But, I would not want to bet my life on whether we beat the S&P500 over the next 10 years. I obviously think there's a reasonable chance of doing it, and we've had periods, I don't know how many out of the 50 55 years we've been doing it or, I don't know how many we've beaten or not. I mentioned earlier that 1954 was my best year, but I was working with absolutely with peanuts, unfortunately. And, I think if you work with small sums of money, I think there is some chance of a few people that really do bring something to the game.

But I think it's very hard for anybody to identify them. And I think that when they work with large funds, it gets tougher. And it's certainly gotten tougher for us, with larger funds. And I would make no promise to anybody that we will do better than the S&P500. But what I will promise them is that I've got 99% of my money in Berkshire. And most members of my family, may not be quite that extreme, but they're close to it. And I do care about what happens to Berkshire over the long period about as much as anybody could care about it. But caring doesn't guarantee results. It does guarantee attention. Greg?

Greg Abel: Well, I would agree Warren that there's never guarantees. But when I look at the assets we have in place and the teams that are in place, I... You're committed to Berkshire, but we have dedicated teams that equally are dedicated to Berkshire and they're sure going to give it their best effort every day. And, when I look at the assets and the people, I think we have, as you said, you can't guarantee it, but we have a great chance of sure giving a good effort to outperform it.

Warren Buffett: It's hard to imagine getting a terrible result with Berkshire but, anything could happen. And what I do know is it would be easier to be running 5 million than... Our book, net worth at Berkshire at the quarter end, I think was Three hundred and seventy some billion, which is down, but it's still greater than the book net worth of any corporation in the United States. I mean, maybe there's some federal corporation that has more, but in terms of... And it may be the greatest in the world. I'm not sure. And that makes life difficult in some ways too.

Greg Abel: Right, and the potential of our operating businesses are substantial. When you think, we've talked about energy, you touched on it, that infrastructure is continuing to change. We're ready for a hundred billion dollars of investment opportunities there. If we just look at the business over the next 10 years and the infrastructure that's required and how it's changing substantial investments there, that just tell me we have very good prospects. And we're well positioned to pursue them. Which again to me, when you look at our core business, you touched on in Burlington, the insurance and energy, our downside is very nicely protected. We have three really core great businesses.

Warren Buffett: Yeah. And we're better positioned than anybody in the energy business just because we don't have dividend requirements. We retained 28 billion of earnings over 20 years. You can't do it if you run a normal public company. And we've got a huge appetite and the and the country needs it, the world needs it. And we are a very logical, well structured, well managed I would say because it doesn't involve me, a company who participate in just huge requirements around the world now. They're slow and they involve state governments. And there's a lot of..., It's not anything that happens dramatically. It will happen. And, and Berkshire should participate in a huge way.

We can do things in insurance, nobody else can do. That doesn't mean much, at many times. But occasionally it may be important. So, there are some advantages to size and strength. But there are disadvantages to size too. If we find some great opportunity for a billion dollars to double our money, that's a billion pretax and that's, 790 million after tax. And on a market value of 450 billion or whatever it may be. That doesn't amount to much, unfortunately. We'll still try and do it if we can.

Greg Abel: Yeah.

Becky Quick: I want to ask this question that came in because I think some people may have had a misinterpretation about something you said a few minutes ago. This is the benefit of being able to get these questions real time, but a few moments ago you were talking about the people at the company who will be allocating capital after you and Charlie are no longer doing it and you mentioned that you've got Todd, Ted and Greg all doing that, but I've gotten a few questions that read similar to this. This one's from [Edward Popula] in New York city who says, "Dear Warren, I noticed you didn't mention Ajit Jain, when you reeled off your list of future management, is he out of the picture?"

Warren Buffett: Well, Ajit is not in the capital allocation business. He is the best... Well, he's got one of the best minds in the world. I mean, I wrote his father after he worked for us for a few years. I wrote him again the other day. But 20 years ago I wrote him and I said, "If you've got another son like this, send him over from India because, well on the world." No Ajit is one of a kind. Anybody will tell you, that's at any contact with him, and particularly anybody in the insurance business where they know him well, he is absolutely one of a kind. But his job is not capital allocation. It's evaluating insurance risks and that is a rare... He possesses a rare talent and he has a huge capital backing to do it. So he's an incredible asset.

But Greg and Todd and Ted have been in the asset allocation business in a big way for a long time. That's their game. And the Ajit's game is insurance. So that's why I mentioned those three. And incidentally, while Charlie and I are around, we kind of like capital allocation ourselves. So we're not going any place voluntarily, but we probably will go someplace involuntarily. Before that long.

Charlie's in good health incidentally. I'm in good health.

Becky Quick: Greg, let me ask you one of these capital allocation questions. This one comes from [Matt Libel] and he says "Berkshire directed 46% of capital expenditure in 2019 to Berkshire Hathaway Energy. Can you walk us through with round numbers how you think differences in capex spending versus economic depreciation versus gap depreciation and help explain the timeframe over which we should recognize the contract of return on equity from these large investments, as we as shareholders are making in Berkshire Hathaway Energy?"

Greg Abel: So when we look at Berkshire Hathaway Energy and their capital programs, we try to really look at it as it was highlighted, really in a couple of different packages. One, what does it actually require to maintain the existing assets for the next 10 20 30 years i.e. it's not incremental, it's effectively maintaining the asset, the reflection of depreciation. And, our goal is always to clearly understand across

our businesses, do we have businesses that require more than our depreciation or equal or less? And happy to say with the assets we have in place and how we've maintained the energy assets, we generally look at our depreciation as being more than adequate if we deploy it back into capital to maintain the asset. Now the unique thing in the lion's share of our energy businesses that are regulated and that exceeds 85% of them, 83% of them, we still earn on that capital we deploy back into that business. So it's not a traditional model where you're putting it in, but you're effectively putting it into maintain your existing earnings stream. So it's not drastically different, but we do earn on that capital.

But what we do spend a lot of time, and that's what when Warren and I think about the substantial amounts of opportunities, that's incremental capital that is truly needed within new opportunities. So it's to build incremental wind, incremental transmission, that services the wind or other types of renewable, solar. That's all incremental to the business and drives incremental both growth in the business. It does require capital, but it does drive growth within the energy business. So there's really the two buckets. I think we would use a number a little bit lower than the depreciation. We're comfortable the business can be maintained at that level and as we deploy amounts above that, we really do view that as quote incremental or growth CapEX.

Warren Buffett: Yeah, we have what, 40 billion or something? What do we have in sort of kind of in the works?

Greg Abel: So we have basically, as Warren's highlighting 40 billion in the works of capital. That's over the next effectively nine years, 10 year period, a little approximately half of that we would view as maintaining our assets. A little more than half of it's truly incremental. And those are known projects we're going to move forward with. And I would be happy to report, we probably have another thirty billion that aren't far off of becoming real opportunities in that business.

As Warren said, that it takes a lot of time. It's a lot of work. The transmission projects, for example, we're finishing in 2020, were initiated in 2008 when we bought Pacific Corp. I remember working on that transmission plan, putting it together, thinking "Six to eight years from now, we'll, we'll have them in operation." 12 years later and over that period of time we earned on that capital, we have invested and then when it comes into service, we earn on the whole amount. So we're very pleased with the opportunity, but we plant a lot of seeds, put it that way.

Warren Buffett: Yeah. And these are not, it's not like they're super high return thing, they're decent returns over time. And we're almost uniquely situated to deploy the capital. As opposed, you could have government entities do it too, but, but in terms of the private enterprise. And they take a long time, they earn decent returns. I've always said about the energy business, it's not a way to get real rich, but it's a way to stay real rich.

And we will deploy a lot of money at decent returns, not super returns. You shouldn't earn super returns on that sort of thing. I mean, you are getting rights to do certain things that governmental authorities are authorizing and that they should protect consumers, but they also should protect people that put up the capital. And, it's worked now for 20 years and it's got a long runway ahead.

Becky Quick: All right, this next question comes from Jason in New Jersey. "As both a Berkshire and Occidental shareholder, I was encouraged to see your investment in the company, but with passing weeks, it became evident that your investment facilitated Occidental management's ability to avoid a shareholder vote on the Anadarko acquisition, a very shareholder unfriendly outcome. This deal proved to be irresponsible and expensive from an Oxy perspective and ultimately very value destructive for Oxy shareholders. In my view, it also permanently hurt Berkshire's reputation in the marketplace. Please

comment on this unfortunate outcome and tell me why Oxy shareholders and other market observers, shouldn't feel this way.”

Warren Buffett: Well, we said right from the beginning, although we didn't certainly expect the degree to it, what's happened. We said essentially when you buy into a huge oil production company, how it works out is going to depend on the price of oil to a great extent. It's not going to be your geological home runs or super mistakes or anything like that. It is a investment that depends on the price of oil and when oil goes to minus \$37 as happened the other day for I guess it was the May contract, that's off the chart. And if you own oil, you should only own oil if you expect these prices to go up significantly. I don't know whether they'll go up significantly or not. We're in the transaction. Our commitment was made on a Sunday when the management of Anadarko favored Chevron and Chevron had a breakup fee of a billion dollars. And-

Chevron had a breakup fee of a billion dollars and accidental people have been working on it for several years and it was attractive at oil prices that then prevailed. And it doesn't work obviously at \$20 a barrel. It certainly doesn't work in minus \$37 a barrel but it doesn't work at \$20 a barrel. And everything the oil companies have been doing, whether it's Exxon or Occidental or anybody else, it doesn't work at these oil prices. That's why oil production is going to go down a lot in the next few years because it does not pay to drill.

Now, that's happened at other times in the past, but the situation is you don't know where you're going to store the incremental barrel of oil and oil demand is down dramatically and for a while the Russians and the Saudis were trying to outdo each other in how much oil they could produce. And when you've got too much in storage, it doesn't work. It's way off that very fast. Now you will have production of oil go down in the United States significantly. It does not pay to drill and all kinds of formations that paid before and it doesn't pay to have paid the price that oil was trading at in the ground a year or two ago. And to that extent, if you're an Occi shareholder or any shareholder in any oil producing company, you join me in having made a mistake so far in terms of where oil prices went and who knows where they go in the future.

Becky Quick: Let me follow up with this one then. This one comes in from Anish Ball who says, is there a risk of permanent loss of capital in the oil equity investments?

Warren Buffett: Well, there certainly is. There's no question. If oil stays at these prices, there's going to be a lot of money, a whole lot of money and middle extend to bank loans and it'll affect the banking industry to some degree. Not that it doesn't destroy them or anything, but there's a lot of money that's been invested that was not invested based on a \$17 or \$20 or \$25 price for WTI, West Texas Intermediate oil. But you can do the same thing in copper. You can do the same thing in some of the things we manufacture. But with commodities it's particularly dramatic and farmers have been getting lousy prices but to some extent the government subsidized them. I'm all for it actually.

But if you're an oil producer, you take your chances on future prices, unless you want to sell a lot of futures forward. Occi actually did sell 300,000 barrels a day, puts in effect that they bought puts but and sold clause and effect to match it. And they were protected for a layer of \$10 a barrel on 300,000 barrels a day. But when you buy oil, you're betting on oil prices over time and over a long time, and oil prices, there's risk and the risk is being realized by oil producers as we speak. If these prices prevail, there will be a lot of bad loans and energy loans and bad debts and energy loans. And if there are bad debts and energy loans, you can imagine what happens to the equity holders. So yes, there's a risk.

Becky Quick: All right. This question comes from Bob Coleman. He says, Warren, could you bring us up to date with the status of your equity put contracts. Sourcing the 2019 annual report found on page 60, it appears at 2019 year in the fair value liability was just under a billion dollars. And if the index is declined 30% the liability obligations balloon to \$2.7 billion. So if the indexes are down, 60% would Berkshire's obligation be close to five and a half billion dollars. Does that math seem reasonable? And are there any loose ends or open exposures, associate [crosstalk]?

Warren Buffett: Between 2004 I think in 2006, I think we wrote 48 maybe 50 contracts, something like that. The shortest was 15 years. The longest was 20 years and we received, as I remember, roughly \$4.8 billion, which we were free to do with what we wanted and we agreed pay based on where one or more of four indices are selling for at the time of expiration. They were so-called European style puts where they're only payable based on one date and we did not have, with a small exception, we did not have to put up collateral, which was part of the deal and we've had that 4.8 billion.

We probably had an original nominal value of something over 30 billion, maybe 35 billion. That's if everything went to zero. I mean Dow Jones went to zero, the footsie went to zero and the Nikkei and so on. A number of those are run off. So we now have about 14 billion nominal. We have something less than half left. We haven't paid out anything significant. We bought back a few of them. If everything went to zero, we would owe 14 billion. If everything were to sell at the same price it was selling for on March 31st, I think it's somewhat less than we carry as a liability on the balance sheet, which is 200 fraction billion. So far so good. I mean we've had the use of a lot of money and the outstanding potential of them as the market went up a lot, we wouldn't have to pay anything and if it goes down some more, we have to pay more than a couple of billion, but we've got the liability set up for that. But so far so good on that and it is not anything that causes us any problem. The final one I think comes due sometime in 2023.

I think there's, I think maybe 20 or 25% of them come due late this year. And so the questionnaire doesn't really understand the bottom bank I can tell by the question and there's no surprises there. There's no way that some liability could double up on us except relating to where those indices close at the expiration of a group of different puts, which like I said, have been more than cut in half and we've done very well on it. Key to that-

Becky Quick: Warren, you mentioned a few minutes ago that you-

Warren Buffett: Well I was just going to say key to that was with just a couple of tiny exceptions, we did not agree to put up collateral. We never would have gotten ourselves in that position and that was when we made the deals we just would not get ourselves in that position and we never will. Where on a given date we could have some tremendous obligation that would come to that we weren't count on getting, having come due. I'm done then Becky.

Becky Quick: Okay. Okay, thanks. So you mentioned a few minutes ago that you're very concerned about Berkshire's longterm health to this question came in from Drew Estes in Atlanta, Georgia who says there's already a speculation of a post Buffet breakup of Berkshire and given the sway carried by modern activists, the speculation should be taken seriously. Many longterm owners see the folly in this view, a \$25 billion ancillary earning stream provides a lot of flexibility when investing insurance float on our and your estate's behalf, could you more forcefully make the case of maintaining Berkshire's current architecture? If you don't, that responsibility will fall on an unknown set of shoulders with far less credibility.

Warren Buffett: Well, if you were to sell Berkshire's various subsidiaries, you would incur a very significant amount of tax at the corporate level before anything was distributed to the shareholders. You

can spin off a given one or something of the sort, but the ability to break up a diverse company without tax implications there was something called the general utilities doctrine that prevailed in various ways up until 1986 and a lot of people seem to comment based on the fact that that didn't happen in 1986. And there's imaginative that ways where people try to avoid taxes and can do it in some cases. On certain types of transactions. If you were to break up Berkshire, that would be one factor, but the interaction of being able to move capital around in terms of being able to do things in insurance that we couldn't do unless there were the backup earnings and capital employed in the other entities.

There's enormous advantages in capital deployment within the place. So there is not a big discount to break up value embodied in Berkshire's price and the situation actually is that although all my Berkshire shares, every share will be given to charities pursuant to a plan I developed back 14 years ago and followed ever since and will continue following this July, I'll be giving away 3 billion or so worth of the stock, but it still involves a big voting percentage that including other people that still remain in the picture aside even from the Buffet family, it isn't going to happen. Now, I will tell you, everybody in the world will come around and propose something and say it's wonderful for shareholders and by the way, it involves huge fees that you do not get impartial advice from Wall Street when there's enormous amount of fees possible for one action and no fees applicable from another action. But you can be sure I've thought about it and I would say that you can count on Berkshire's present posture being continued for a long time. I can't tell you what's going to happen a hundred years from now and I can't tell you exactly what would happen for example if certain ideas in terms of wealth taxes changed or taxes on foundations change. But my plan has been thought out and in place for a long time and it not only ensures that the money that's been made, all Berkshire, all of it ends up going to various philanthropies staggered over time, but it also will keep the walls away. Greg, do you have any thoughts on that?

Greg Abel: I think the comment on the capital allocations critical that we have the ability to move the capital amongst the, be it the operating businesses or up to the insurance are down with really no consequences to our shareholders. That's the value driver of the unique structure of Berkshire and it creates immense value. So that's all I would add or second I guess.

Becky Quick: All right, this question comes from Rob Grandish in Washington DC he says, interest rates are negative in much of Europe, also in Japan. Warren has written many times that the value of Berkshire's insurance companies derive from the fact that policy holders pay up front creating insurance float on which Berkshire gets to earn interest. If interest rates are negative, then collecting money up front will be costly rather than profitable. If interest rates are negative, then the insurance float is no longer a benefit but a liability. Can you please discuss how Berkshire's insurance companies would respond if interest rates became negative in the United States?

Warren Buffett: Well, they were going to be negative for a long time. You better own equities or you better own something other than that. It's remarkable what's happened in the last 10 years. I've been wrong in thinking that you could really have the developments you've had without inflation taking hold, but we have 120 odd billion while we have some almost very high percentage in treasury bills some just in cash, but those treasury bills are paying us virtually nothing now. They're a terrible investment over time, but they are the one thing that when opportunity arises, it will arise at a time and maybe the only thing you can look to pay for those opportunities is the treasury bills you have. I mean, the rest of the world may have stopped and we also need them to protect, be sure that we can pay the liabilities we have in terms of policy holders over time. And we take that very seriously.

So if the world turns into a world where you can issue more and more money and have negative interest rates over time, I'd have to see it to believe it, but I've seen a little bit of it. I've been surprised. So I've

been wrong so far. I don't see how you can create ... I would say this, if you're going to have negative interest rates and pour out money and incur more and more debt relative to productive capacity, you'd think the world would have discovered it in the first couple thousand years rather than just coming on it now. But we will see. It's probably the most interesting question I've ever seen in that economics is can you keep doing what we're doing now and we've been able to do it or the world's been able to do it for now a dozen years or so but we may be facing a period where we're testing that hypothesis that you can continue it with a lot more force than we've tested before. Greg, do you have any thoughts on that? I wish I knew the answer. Maybe you do.

Greg Abel: No, I think as you articulated, I think it was in the annual report too. I mean we don't know the answer, but as you said, some of the fundamentals right now are very interesting relative to having a negative interest rate. But I hate to say it, but I don't have anything to add.

Warren Buffett: I'd love to be secretary of the treasury if I knew I could keep raising money at negative interest rates, that makes life pretty simple. We're doing things that we really don't know the ultimate outcome and I think in general are the right things, but I don't think they're without consequences and I think they could be kind of extreme consequences pushed far enough but there would be kind of extreme consequences if we didn't do it as well. So if somebody else has to unbalance those questions.

Becky Quick: All right. This question comes from Adam Schwartz in Miami, Florida and he says Berkshire is the largest holding in his partnership, which also houses most of their net worth. He says, Berkshire's invested in many capital intensive businesses through the years, railroads as an example, how do you think about the inflationary or even deflationary risks for all of the capital intensive businesses and could this to be an existential problem for businesses? Kind of referencing what you were just talking about that eventually the bill for the debts being issued comes due, will it eventually come from all businesses through some combination of higher tax rates on corporations, increased wages for the lower middle class et cetera?

Warren Buffett: Well, I certainly think that increased corporate taxes are a much higher probability than having lower corporate taxes. So I think that we got handed as a corporation, a big chunk of what used to be the government's profits from our business a couple of years ago. And it would depend on to some extent, which party is elected and whether they have control of both houses as well as the presidency and who knows what else. But we could very easily have higher corporate income taxes and perhaps much higher corporate income taxes at some point. And in terms of capital intensive businesses, they're just not as good. If you can find an equally good business in terms of operations that doesn't require capital. [inaudible] never required capital. Didn't grow but it just doesn't, it didn't take money to expand it and it just delivered enormous sums to us.

And because we own it within Berkshire to redeploy it elsewhere didn't require a lot of tax expense either at the corporate level or at the personal level. So you really want a business and everybody wants a business that doesn't take any capital to speak of and keeps growing. It doesn't take more capital as it grows. Now are you totally business, [inaudible] the energy business requires more capital as it grows. Our railroad business to some extent requires more capital if it doesn't grow even. So capital intensive businesses by their nature are not as good as something where people pay in banks and you don't need the capital. If you look at where the top market value is in a \$30 trillion market, if you take the top four or five companies that account for maybe four trillion or so of that 30 trillion. Basically they don't take much capital.

And that's why they're worth a lot of money because they make a lot of money and they don't require the money to any great extent in the business. We own some businesses like that, but it's certainly not the

railroad and it's not the energy business. There are good businesses. We love them, but if they didn't take any capital, they'd be unbelievable. That's what we've learned from 50 or 60 years of operating businesses that if you can find a great business that doesn't require capital, when it grows, you've really got something. And to a certain extent, because insurance uses the kind of assets we would like to own anyway. Our insurance business doesn't really take capital. It requires having capital available, but we're able to invest that money largely in things we'd like to own anyway. So we're particularly well suited for the insurance business and it's really been the most important factor in our growth over the years. Although a lot of other things contribute. Greg, you were in the capital intensive business. Tell us about it.

Greg Abel: Well I think there's no question obviously we would prefer to be in a less capital intensive business, but there are unique opportunities there. The one I would touch on when I think of inflation or even potentially as we go through this crisis and maybe a prolonged one or depending on how long it takes to recover. I mean we are in a unique, when we're looking at energy or rail, we do have a certain amount of pricing power and it's through our regulatory formulas or how our arrangements are with our customers. So if we then were to move into an inflationary period, it's not perfect protection, but those businesses generally can recover a significant portion of their costs, even in an inflationary environment and still are in a reasonable return. They're not going to be great returns as you highlighted Warren, but they're still going to earn a reasonable return on their capital even in an inflationary period. There may be some lag in some things like that, but there's still going to be very sound investments.

Warren Buffett: Oh yeah. If there was 10 for one inflation, make it extreme-

Greg Abel: Yeah.

Warren Buffett: We'd be happy we own the railroad, very happy. Well, we'd been investing a lot of capital in it, but that business is, in my view, is a very, very solid business for many, many, many, many decades to come. I said originally we bought it with a hundred year time horizon and I've extended that so it will earn more dollars if there's a lot of inflation. In real terms, who knows but it would earn a lot more dollars and a lot of the energy projects but it's better if we don't have inflation and it's better if we don't have capital. If we can find the same sort of businesses that aren't as capital intensive. We've got capital. I mean we're ideally positioned for capital intensive businesses that other people will have trouble raising capital for, but they've still got to promise decent returns.

Becky Quick: All right. This question comes from Charlie Wang, he's a shareholder in San Francisco. He says, given the unprecedented time of the economy and the debt level, could there be any risks and consequences of the US government defaulting on its bonds?

Warren Buffett: No. If you print bonds in your own currency, what happens to the currency is it can be a question because you don't default. And the United States has been smart enough and people have trusted us enough to issue, which is that in its own currency and Argentina is now having a problem because the debt isn't in their own currency and lots of countries have had that problem. And lots of competent countries will have that problem in the future. It is very painful to owe money in somebody else's currency, but listen, if I could issue a currency Buffet bucks and I had a printing press and I could borrow money, I would never default. So what you end up getting in terms of purchasing power can be in doubt, but in terms of the US government, [inaudible] downgraded the United States government, I think it was [inaudible] some years back. That to me did not make sense.

In the end how you can regard any corporation as stronger than a person who can print the money to pay you, I just don't understand. So don't worry about the government defaulting. I think it's kind of crazy

incidentally, that should be said to have these limits on the debt and all of that sort of thing and then stopped government arguing about whether it's going to increase the limits, we're going to increase the limits on the debt. The debt isn't going to be paid. It's going to be refunded and anybody that thinks they're going to bring down the national debt. I mean there's been brief periods and I think it was the late nineties or thereabouts, when the debts come down a little bit, the country's going to print more debt. The country is going to grow in terms of its debt paying capacity but the trick is to keep borrowing in your own currency.

Becky Quick: Emphasis on the trick. This question comes from David Cass. He is a clinical professor of finance at the University of Maryland and he says, Berkshire has invested in many companies with stock buy-back programs. Recently there's been a backlash against buy-backs. What are your views on this subject?

Warren Buffett: Well, it's very politically correct to be against buy-backs now and they're going to incorporate it in the [inaudible] program. There's a lot of crazy things said on buy-backs. Buy-backs are so simple. I mean it's a way of distributing cash to shareholders. And let's just say that you and I and Greg, the three of us decided to buy an auto dealership or a McDonald's franchise or something and we each put a million dollars in or whatever the number may be and we get along with each other and the business grows and all of that and one of us really wants to spend our share of the earnings and the other two want to leave the money in the business to grow. Now the three of us did that and we the only shareholders, we would not establish a 100% dividend payout for everybody and we wouldn't freeze the one that wanted to get out either.

The logical thing to do is to buy a portion, whatever that person wants to spend annually from the earnings, buy a portion of their stock and the other two find their interest in the company goes up and the third person still has a little more of an interest by what they leave in but they also can take some money out of the business. You're taking money out of the business and in either case and one you call dividends and you send it to everybody whether they want it or not. And with buy-backs you'd give it to the ones who want the money. And I have been following a policy of giving away stock now since 2006 and I'll give away a lot of stock. But the philanthropies that receive it, they just have to spend the money very promptly on a current basis more or less.

So they are getting \$ 3 billion worth of stock or whatever it may be. And I'm in effect reducing my interest in Berkshire, but Berkshire still retaining more capital than I'm giving away. So I have more dollars invested, but my interest goes down and the people that need the cash to carry out the philanthropic efforts, they cash out the stock. And I don't force my sister or whoever it may be to take a bunch of money she doesn't want, she wants it reinvested. All of it, reinvest in the business. And people that don't want to consult some of their stock and the company ends up in the same position. We've distributed some of the capital that we don't need for growth. Now, whether the company should buy it depends on a couple of things. One is they ought to retain the money they need for intelligent growth prospects and that's fine.

And secondly, and this is a point that's never mentioned, they should be buying it back below what they think it's worth. Now they'll make mistakes in that, but you make mistakes in a lot of businesses isn't. But over that should be the guiding principle. And to my knowledge, JP Morgan, Jamie Diamond said out once, and we've said at various times, we will repurchase shares when it's to the advantage of the continuing shareholder to have us do so. But you read about all these buy-back problems is that we're going to spend 5 billion buying it back, or 10 billion. Well, that's like saying I'm going to go out and buy

some business this year for 5 billion without knowing what you're going to get for the money. It should be price sensitive.

Obviously it should be needs sensitive obviously, but when the conditions are right, it should also be obvious to repurchase shares and there shouldn't be the slightest taint to it anymore than there is to dividends and people that have now sort of taken up the cries about how terrible it was that companies bought [inaudible] well he didn't say it was terrible for them to pay dividends to them. They'd have more money now, but they were doing what was intelligent at the time and I hope they continue to do it as intelligent as they go forth. Greg?

Greg Abel: No, the only thing I know you've commented on in the past, Warren, is that I think the one thing we are seeing, and obviously we're supportive of buy-backs, but there are companies that used probably their financial engineering was just a little-

Warren Buffett: Extreme.

Greg Abel: Extreme and too cute that effectively you're using every ounce of your balance sheet to buy back stock at a time where you're really creating no cushion for your business for any type of event or bump in the road. And we're going to see that. And I think that's a very unfortunate outcome of them. And hence you get some of the backlash, but there are still companies as you highlighted many that do it right?

Warren Buffett: Yeah, no, if they're buying it back because it's fashionable because they really do like the idea. There's nothing wrong with taking an action that increases the value of the remaining shares. But if they're doing it ... and I've been witness to some programs where it really is stupid, but I don't think it's immoral. I just think it's stupid basically. And on the other hand we've favor companies that take care of all our requirements for growth and as Greg says, maintain sound balance sheets and all of that, leave a margin of error for things that you can get surprised with. And if they find their stocks selling below the business is intrinsically worth, I think that they're making a big mistake if they don't buy-in their stock. And it's got to be a political football. And like I say that when it becomes politically correct to do something in this country, if you're a politician, the best thing to do is get on board. But Berkshire is going to do what it thinks makes sense for a shareholder. And we like investing in companies that think that way too. And then not all companies obviously do.

Becky Quick: All right. Here's a question from Lou Bogart in Boca Raton, Florida. He says, I'm a longtime shareholder with a concern as I head into retirement, I understand the theory that splitting shares does nothing for the value of shares. However, with the extremely high price on A shares, when I wish to drown down some money on my portfolio in retirement I'm facing a large tax. Say the average price has been about \$300,000 this year. And I'm sitting on a \$200,000 capital gains liability for each share. If I need \$60,000 in additional cash during my retirement, I need to sell a full share and get hit with \$200,000 tax liability. If you would split the stock 10 for one, I could sell two \$30,000 shares and keep my tax liability at a more manageable 40,000. I could also maintain more of my investment in Berkshire. He said, have you thought about-

...husband in Berkshire. He said, "Have you thought about this? In retrospect, I should have bought B shares but didn't think about it at the time."

Warren Buffett: Well, you can convert A to B shares, which is exactly what takes place when I give away the money in July to the five foundations. I actually convert it immediately before the gift. So they get B shares, and the truth is the B shares are very useful to people that want to either give away a small

portion of what they have, or spend it or whatever it may be. So you can convert the A to B shares, which is exactly what I've been doing now for 14 years as I give it away, and solve that problem. We split the B shares, as I remember it, at one point, just to make it even more manageable so that people could deal with smaller denominations.

The A shares have a different voting power. But we passed some resolution sometime ago, I think, and certainly would be the case. In any event, we're never going to give the A shares an advantage over the B. They used to have an advantage in a shareholder designated contribution program that we had, and we put that in there when we started. But that goes way back in time, and that doesn't exist anymore, so that the B and the A are going to get treated exactly the same over time. It's true, the A have more votes, and they sell very close to parity all the time. So I would say that if you want to do anything in terms of raising cash and you've got a lot of A shares, take one or two shares of A, and plenty of people I know have done this, and just cash it in and turn it into B and give yourself whatever amount of cash you want to get.

Becky Quick: This is one that comes from Thomas Lin in Taiwan. He says, "Warren once said that banking is a good business if you don't do dumb things on the assets side. Given that the pandemic might put a lot of pressure on the loans, dumb things that got done in the past few years are likely to explode. Through reading annual reports, 10Qs and other public information, what clues are you looking for to decide whether a bank is run by a true banker who avoids doing dumb things?"

Warren Buffett: That's a very good question, but I would say that the one thing that made Chairman Powell's job a little easier this time than it was in 2008-09 is that the banks are in far better shape. So in terms of thinking about what was good for the economy, he was at the same time worrying about what he was going to do with bank A or bank B. To merge them was somebody or add strains to the syst or anything. The banks were very involved with a problem in 2008 and '09. They had done some things they shouldn't have done, some of them, and they were certainly in far different financial condition than now. So that the banking system is not the problem in this particular show. I mean, we decided as a people to shut down part of the part of the economy in a big way, and it was not the fault of anyone that it happened. Things do happen in this world. Earthquakes happen. Huge hurricanes happen. This was something different.

But the banks need regulation. I mean, they benefit from the FDIC, but part of having the government standing behind your deposits is to behave well. I think that the banks have behaved very well, and I think they're in very good shape. I mean, that's why the FDIC has built up a hundred billion dollars that I've talked about. I mean, they've assessed the banks in recent years at accelerated amounts in certain periods, and they even differentiated against the big banks. So they built up great reserves there. Then they built their own balance sheets and they are not presently part of Chairman Powell's problem, whereas they were very much part of Chairman Bernanke's problem back in 2008 and '09.

How you spot the people that are doing the dumb things is not easy because... Well, sometimes it's easy, but I don't see a lot that bothers me, but banks are in the end, institutions that operate with significant amounts of other people's money, and if problems become severe enough in an economy, even strong banks can be under a lot of stress, and we'll be very glad we've got the federal reserve system, standing behind them. I don't see special problems in the banking industry now. I could think of possibilities, and Jamie Diamond referred to this a little bit in the JP Morgan report. You can dream of scenarios that puts a lot of strain on banks, and they're not totally impossible, and that's why we have a [inaudible]. I think overall the banking system is not going to be the problem. I wouldn't say that with a 100% certainty because there are certain possibilities that exist in this world where banks could have problems. They're going to have problems with energy loans. They're going to have problems. Some, they're going to have

extra problems with consumer credit. They're going to have that. But they know it, and they're well reserved. Well, they're well capitalized for it. They were reserved building in the first quarter, and they may need to build more reserves. But they are not a primary worry of mine at all. We own a lot of banks. Or, we own a lot of bank stocks.

Greg, do you have any thoughts on it?

Greg Abel: You touched on it earlier too, just in general, which is we don't know how long this pandemic will go. We don't know if there's going to be a second event, which are just risks that are really unknown at this time, and the banks will have to continue to manage that as the businesses do. But you've already highlighted that obviously.

Warren Buffett: Becky.

Becky Quick: All right, this question, I was looking for one of these, because I got several questions that came in similar to this. I was looking for one of these a moment ago. This one's from Andrew [Wenky]. He says, "Can you ask Warren why he didn't repurchase Berkshire shares in March when they dropped to a price that was 30% lower than the price that he had repurchased shares for in January and February?"

Warren Buffett: Yeah, it was very, very, very short period where they were 30% less. But I don't think Berkshire shares relative to present value are at a significantly different discount than they were when we were paying somewhat higher prices. I mean, it's like Cain said, or whoever it was. I don't know. The facts change. I change my mind. What do you do, sir? We always think about it, but I don't feel that it's far more compelling to buy Berkshire shares now than I would've felt three months or six months or nine months ago. It's always a possibility. We'll see what happens. Greg, you think about repurchasing shares?

Greg Abel: Generally. No, I think our approach, Warren's, the right approach. I can't really add anything other than, the approach is the right approach. We approach it when we see it's the right thing for our shareholders to be repurchasing. That doesn't mean we're repurchasing all timer or the view doesn't change.

Warren Buffett: There could be a price relative to value at the time, not real as what it was worth a year ago. I mean, the value of certain things have decreased. Our airline position was a mistake. Berkshire is worth less today because I took that position than if I hadn't. There other decisions like that, and it is not more compelling to buy the shares now than it was when we were buying them. It's not less compelling. I mean it's a wash. But the price has not gotten to a level or not been at a level where it really feels way better to us than other things, including the option value of money to stop up in a big, big way.

Becky Quick: This question comes from three investors in Israel. Lidars [Luf], Yossi Luf, and Dan Gorfung. They want to know about the credit card industry. It says, how do you explain the rise in the average credit card interest rate in recent years compared to the federal fund's rate? What are the forces that you think might keep it at or around current levels and what are the forces that might drive it lower in the future?

Warren Buffett: Well, that is not a subject that I'm... Obviously it affects American Express to some degree. It affects the banks we own, but interest rates on credit cards respond to competition, obviously, to loss potential, which obviously has gone up significantly in the last few months. Although it's gone down perhaps from some other periods you can pick in the past. But I don't really have much I can bring to the party on that question. Well, that isn't true. Our furniture companies, a couple of them have their own credit card or they do a lot of business on other people's credit cards.

My general advice to people, I mean, we have an interest in credit cards. But I think people should avoid using credit cards as a piggy bank to be rated. I had a woman come to see me here not long ago, and she'd come on some money. Not very much, but it was a lot to her. She's a friend of mine, and she said, "What should I do with it?" I said, "Well, what do you owe on your credit card?" She says, "Well, I owe X." I said, "Well, what you should do..." I don't know what interest rate she was paying, but I think I asked her and she knew. It was something like 18% or something.

I said, "I don't know how to make 18%." I mean, if I, owed any money at 18% the first thing I do with any money I had would be to pay it off. It's going to be way better than any investment idea I've got. That wasn't what she wanted to hear. Then later on in the conversation, she talked about her daughter and her daughter had \$1000 or \$2,000 or something. She said, "Well, what should I do with, she named the girls' money?" I said, "Have her lend it to you. I mean, if you're willing to pay 18% or whatever, I mean, she's not going to find a better deal. I'll lend you money."

It just doesn't make sense. You can't go through life borrowing money at those rates and be better off. So I encourage everybody, it's contrary to Berkshire's interests in certain cases, and the world is in love with credit cards. But I would suggest to anybody that the first thing they do in life is, they can get to something else later on, but don't be paying even 12% to anybody. I mean, it's pay that off, and if they're really a good credit, and they don't want to do it, come and see me personally. I'll lend you the money at that rate. Greg, what do you tell your children?

Greg Abel: Same advice. Excellent advice. No, I have three that carefully use their credit card. Obviously people use it a lot more as they go into the digital world and and e-commerce world, but then the goal has to be to repay it. It doesn't mean you, because you have to use it for those types of transactions. You run up the balance. But there's an incremental risk there now. I.

Warren Buffett: t's a matter of convenience for some people.

Greg Abel: Yeah.

Warren Buffett: But I would have trouble, if I were paying 12% for money or whatever it might be, it would not be a good thing. You won't see Berkshire paying that. [inaudible].

Becky Quick: Warren, this question is from Lindsay Schumacher. [crosstalk].

Warren Buffett: Well, we probably ought to wind this up maybe in 15 minutes. Can you select the best ones?

Becky Quick: Okay. Absolutely. I've got a couple more questions for you. This one's from Lindsey Schumacher. She says, "Warren, what's your opinion regarding the Payroll Protection Plan?"

Warren Buffett: Well, I don't want to get into politics generally, but I think that's a very good idea to take care of the people that are having terrible troubles taking care of themselves in a period like this. I mean, if the government and surrounding conditions and whatever it may be. If you're telling a lot of businesses essentially, quit doing business for a long time, and it's one thing to tell me, but to tell somebody that's living from paycheck to paycheck that way. I'm all for it. It must be hell to administer. I mean, any huge program. I'll never get into criticizing on how people do this or that because I've had problems myself in running a few big things. It just isn't that easy to inaugurate incredibly large problems.

There's going to be a certain amount of fraud. Everything doesn't go perfectly, but I am a 100% for taking care of the people that really get hurt by something that they've got nothing to do with. Who

knows how long it lasts. You've got millions and millions of people that are worrying about something that they weren't worried about a few months ago, and they didn't do anything. They showed up for work on time and they pleased the people they dealt with, whatever it may have been. Now they don't have a job, or they've been furloughed or whatever.

So, I'm totally for the basic idea, and I think it's very difficult. We can't carry it out perfectly. You do your best, and you do it promptly. I give real credit to both Congress for acting promptly on what the problem is. They've sort of caught on from what they learned in 2008 and '09 I think, and I give credit to trying to do what I think is very much the right thing. I don't sit around and think about how I could do it better. Greg?

Greg Abel: I agree with the comments.

Becky Quick: Warren, this question comes from Bill Murray, the actor, who's also a shareholder in Berkshire. He says this pandemic will graduate a new class of war veterans. Healthcare, food supply, deliveries, community services. So many owe so much to these few. How might this great country take our turn and care for all of them?

Warren Buffett: Well, we won't be able to pay, actually. It's like people that landed at Normandy or something. I mean the poor, the disadvantaged, they suffer. There's an unimaginable suffering. At the same time they're doing all these things. They're working 24 hour days, and we don't even know their names. So if we go overboard on something, we ought to do things that are going to help those people. This country, said it a lot of times before. But the history of it. I mean, we are a rich, rich, rich country, and the people that are doing the kind of work that Bill talks about, they're contributing a whole lot more than some of the people that came out of the right womb, or got lucky and things, or know how to arbitrage bonds or whatever it may be.

In a large part, I'm one of those guys. So you really try to create a society that under normal conditions with more than \$60,000 of GDP per capita, that anybody that worked 40 hours a week can have a decent life without a second job and with a couple of kids. They can't live like kings. I don't mean that. But nobody should be left behind. It's like a rich family. You find rich families, and if they have five heirs or six heirs, they try and pick maybe the most able one to run the business. But they don't forget about... Actually, maybe a better citizen in some ways even than the one that does the best at business. But it just doesn't have market value skills. So I do not think that a very rich company ought to totally abide by what the market dishes out in 18th century style or something was something of the sort.

I welcome ideas that go in that direction. We've gone in that direction. We did come up with social security in the 30s. We've made some progress, but, we ought to. I mean, we have become very, very, very rich as a country, and things have improved for the bottom 20%. I mean, you can see various statistics on that. But I'd rather be in the bottom 20% now than be in the bottom 20% a 100 years ago or 50 years ago.

But what's really improved, the top 1%, and I hope we as a country move in a direction where people Bill was talking about get treated better, and it isn't going to hurt. It isn't going to hurt the country's growth, and it's overdue. But a lot of things are overdue. I will still say we're a better society than we were a 100 years ago, but you would think with our prosperity we wouldn't hold ourselves to even higher standards of taking care of her fellow man, particularly when you see a situation like you've got today where it's the people whose names you don't know that are watching the people come in and watching the bodies go out. Greg?

Greg Abel: Yeah. The only other group that I would highlight, and I think it'll be very interesting how it plays out is with the number of home schooling and the children that are home. We've always had so much respect for teachers, but we all talk about how we don't take care of them. It is remarkable to hear how many people comment that clearly we don't recognize, or I have a little eight year old Beckett at home and plenty of challenges for mom, but all of a sudden you respect the institution, the school, the teachers and everything around it.

Then when I think of our companies and the delivery employees we have, it's absolutely amazing what they're doing, and they're truly on the front line. That's where we have our challenges around keeping them health and safety. Then you go all the way to the rail. The best videos you see out of our companies are when we have folks that are actively engaged in moving supplies, food, medical products, and they're so proud of it, and they recognize they're making a difference. So a lot of it is we just sold them a great thanks. Warren, you touched on it. We can some way, maybe hopefully longer term compensate them, but there's a great deal of thanks, and I probably just think an immense amount new appreciation for a variety of folks.

Warren Buffett: We're going in the right direction all around the country, but it's been awfully slow.

Greg Abel: Yeah.

Becky Quick: Gentlemen, I'll make this the last question. It comes from Phil King. He says, "Many people in the press and politics are questioning the validity of capitalism. What can you say to them that might prompt them to take a look at capitalism more favorably?"

Warren Buffett: Well, the market system works wonders, and it's also brutal if left entirely to itself. We wouldn't be the country we are if the market system hadn't been allowed to function. To some extent you can say that other countries around the world that have improved their way of life dramatically, to some extent have copied us. So the market system is marvelous in many respects. But it needs government, and it is creative destruction. But for the ones who are destroyed, it can be a very brutal game, and for the people who work in the industries and all of that sort of thing. So I do not want to come up with anything different than capitalism, but I certainly do not want unfettered capitalism. I don't think we'll move away from it, but I think we capitalists, I'm one of them. I think there's a lot of thought that should be given to what would happened if we all drew straws again for particular market based skills.

Somewhere way back, somebody invented television, I don't know what it was. Then they embedded cable, then they invented pay systems and all of that. So a fellow that could the bat .406 in 1941 was worth \$20,000 a year and now a marginal big leaguer makes greater sums because in effect, the stadium size was increased from 30 or 40 or 50,000 people to the country, and the market system, capitalism took over. It's very uneven and it's only, I think the [inaudible] worth a lot more money than I ever should make.

But the market system can work toward a winner takes all type situation, and we don't want to discourage people from working hard and thinking hard. But that alone doesn't do it. There is a, a lot of randomness in the capitalist system, including inherited wealth. I think we can keep the best parts of our market system and capitalism, and we can do a better job of making sure that everybody participates in the prosperity that that produces. Greg?

Greg Abel: Yeah, no, I think it's always keeping the best parts of it. I even think if we look at the current environment we're in, i.e., in the pandemic and we have to do it only when we can do it properly and re-emerge. But in some ways the best opportunity for people is when we're back working clearly, and that

the system's functioning again. But that's the obvious. Then there's, Warren, you've highlighted, there's a lot of imperfections, but it's definitely the best model out there that just needs some fine tuning.

Warren Buffett: Becky, at the end. [crosstalk] I could just say, oh, sure, go ahead.

Becky Quick: Can I just slip in one more quick question? I forgot this one. Someone sent it in earlier. Thanks. Anderson Haxton wrote in, he said, "Warren mentioned that Ben Graham is one of the three smartest people he's ever met. I'd like to ask him the names of the other two."

Warren Buffett: Well, I may not be one of the smartest, but I'm smart enough not to name the other two. I'd make two people happy. Ben Graham is one of the three smartest people. I've known some really smart people. Smartness does not necessarily equate to wisdom either. Ben Graham, one of the things he said he liked to do every day was he wanted to do something creative, something generous, and something foolish. He said he was pretty good at the latter. But it was pretty good. It was amazing, actually at the creative. But it's interesting that IQ does not always translate into rationality and behavioral success or wisdom. So I know some peoples that are extraordinarily wise that would not be in the top three on an IQ test. But if I wanted their judgment on some matter, even if I wanted to put them in a position of responsibility someplace, I might prefer them to, we'll say one of the three. That'll leave the other two feeling fine, of the three. Greg, do you have any thoughts on that?

Greg Abel: Nope, I agree with the person you named.

Warren Buffett: Yeah. Becky. I would just say again that I hope we don't, but we may got some unpleasant surprises. We're dealing with a virus that spreads its wings in a certain way, in very unpredictable ways. How Americans react to it. There's all kinds of possibilities. But I definitely come to the conclusion after weighing all that sort of stuff. Never bet against America. So, thanks.

Greg Abel: Yep.

Becky Quick: Thank you. I appreciate your time tonight.

Warren Buffett: We'll see you next year, and we'll fill this place. Okay.

Government Employees Insurance Co.

Full employment, boomtime profits and record dividend payments do not set the stage for depressed security prices. Most industries have been riding this wave of prosperity during the past five years with few ripples to disturb the tide.

The auto insurance business has not shared in the boom. After the staggering losses of the immediate postwar period, the situation began to right itself in 1949. In 1950, stock casualty companies again took it on the chin with underwriting experience the second worst in 15 years. The recent earnings reports of casualty companies, particularly those with the bulk of writings in auto lines, have diverted bull market enthusiasm from their stocks. On the basis of normal earning power and asset factors, many of these stocks appear undervalued.

The nature of the industry is such as to ease cyclical bumps. Auto insurance is regarded as a necessity by the majority of purchasers. Contracts must be renewed yearly at rates based upon experience. The lag of rates behind costs, although detrimental in a period of rising prices as has characterized the 1945-1951 period, should prove beneficial if deflationary forces should be set in action.

Other industry advantages include lack of inventory, collection, labor and raw material problems. The hazard of product obsolescence and related equipment obsolescence is also absent.

Government Employees Insurance Corporation was organized in the mid-30's to provide complete auto insurance on a nationwide basis to an eligible class including: (1) Federal, State and municipal government employees; (2) active and reserve commissioned officers and the first three pay grades of non-commissioned officers of the Armed Forces; (3) veterans who were eligible when on active duty; (4) former policyholders; (s) faculty members of universities, colleges and schools; (6) government contractor employees engaged in defense work exclusively, and (7) stockholders.

The company has no agents or branch offices. As a result, policyholders receive standard auto insurance policies at premium discounts running as high as 30% off manual rates. Claims are handled promptly through approximately 500 representatives throughout the country.

The term "growth company" has been applied with abandon during the past few years to companies whose sales increases represented little more than inflation of prices and general easing of business competition. GEICO qualifies as a legitimate growth company based upon the following record:

Year	Premiums Written	Policyholders
1936	\$103,696.31	3,754
1940	768,057.86	25,514
1945	1,638,562.09	51,697
1950	8,016,975.79	143,944

Of course the investor of today does not profit from yesterday's growth. In GEICO's case, there is reason to believe the major portion of growth lies ahead. Prior to 1950, the company was only licensed in 15 of 50 jurisdictions including D. C. and Hawaii. At the beginning of the year there were less than 3,000 policyholders in New York State. Yet 25% saved on an insurance bill of \$125 in New York should look bigger to the prospect than the 25% saved on the \$50 rate in more sparsely settled regions.

[More Compilations](#)

As cost competition increases in importance during times of recession, GEICO's rate attraction should become even more effective in diverting business from the brother-in-law. With insurance rates moving higher due to inflation, the 25% spread in rates becomes wider in terms of dollars and cents.

There is no pressure from agents to accept questionable applicants or renew poor risks. In States where the rate structure is inadequate, new promotion may be halted.

Probably the biggest attraction of GEICO is the profit margin advantage it enjoys. The ratio of underwriting profit to premiums earned in 1949 was 27.5% for GEICO as compared to 3.7% for the 135 stock casualty and surety companies summarized by Best's. As experience turned for the worse in 1950, Best's aggregate's profit margin dropped to 3.0% and GEICO's dropped to 18.0%. GEICO does not write all casualty lines; however, bodily injury and property damage, both important lines for GEICO, were among the least profitable lines. GEICO also does a large amount of collision writing, which was a profitable line in 1950.

During the first half of 1951, practically all insurers operated in the red on casualty lines with bodily injury and property damage among the most unprofitable. Whereas GEICO's profit margin was cut to slightly above 9%, Massachusetts's Bonding & Insurance showed a 16% loss, New Amsterdam Casualty an 8% loss, Standard Accident Insurance a 9% loss, etc.

Because of the rapid growth of GEICO, cash dividends have had to remain low. Stock dividends and a 25-for-1 split increased the outstanding shares from 3,000 on June 1, 1948, to 250,000 on Nov. 10, 1951. Valuable rights to subscribe to stock of affiliated companies have also been issued.

Benjamin Graham has been Chairman of the Board since his investment trust acquired and distributed a large block of the stock in 1948. Leo Goodwin, who has guided GEICO's growth since inception, is the able President. At the end of 1950, the 10 members of the Board of Directors owned approximately one-third of the outstanding stock.

Earnings in 1950 amounted to \$3.92 as contrasted to \$4.71 on the smaller amount of business in 1949. These figures include no allowance for the increase in the unearned premium reserve which was substantial in both years. Earnings in 1951 will be lower than 1950, but the wave of rate increases during the past summer should evidence themselves in 1952 earnings. Investment income quadrupled between 1947 and 1950, reflecting the growth of the company's assets.

At the present price of about eight times the earnings of 1950, a poor year for the industry, it appears that no price is being paid for the tremendous growth potential of the company.

A Letter to the Editor: Real Estate Acquisitions

12/24/1962

To the Editor:

I have just finished reading your articles regarding publicly owned real estate companies, which were most interesting and perceptive. This is a story that needed to be told.

An item fully as important as the lack of quantitative coverage of dividends may well turn out to be the dubious quality of the income of many of these companies. Whereas it is somewhat difficult in many cases to determine this quality, there are certain known instances which literally shout for disclosure, and I think there is reason to believe that continued probing would develop still more instances.

To give you an example of the sort of thing I have in mind, let me cite two instances, to which you referred, from the Kratter Corp. prospectus of 1961, prepared in connection with the debenture issue which never materialized:

1. On page 50 of the "red herring" prospectus, reference is made to 140,000 containers under lease to F. & M. Schafer Brewing Co. These containers were purchased by a joint venture in August 1958, for \$2,800,000 and immediately net leased back to the brewery for five years at \$710,000 annually. What this really amounted to, of course, was a financing transaction for the brewing company. However, the impression the public stockholder gets is that this \$710,000, comingled with other operating income from real estate, has the same quality and expected longevity that might be expected from a first-class office building. Therefore, if the casual stockholder takes the \$710,000 and capitalizes it at 9%, he immediately attributes a value of almost \$8 million to something which initially only had a value of \$2,800,000 and whose value is declining at an extreme rate. Various brokerage offices have issued reports involving just this sort of valuation. This would appear to be trading upon the lower level of intelligence in Wall Street.
2. On the same page in the "red herring," reference is made to various machines acquired from Dashew Business Machines and under lease, either to Standard Oil of California or Dashew, itself. There are two arrangements here, but suffice to say that the eight machines leased to Dashew were purchased for \$660,000 in August 1960 and leased back for five years for \$153,000 per annum with the subsequent five years available to Dashew at \$9,900 per annum. Anyone assuming that the \$153,000, which is contributing just that much to the current operating income of Kratter, has the aspect of long-term prime real estate income is due for a real shock when the renewal period comes up.

This sort of transaction is very similar to buying a royalty on a short-lived oil well. If the gross receipts are spent each year, one soon finds out that the capital is not self-replacing. To ignore the concept of amortization or depreciation on such transactions is dubious, if not fraudulent.

I think you have done a real public service in taking a good, hard look at the "advanced accounting techniques" of this new industry. It has many of the aspects of a chain letter scheme or a "Ponzi" operation, and the sooner articles such as yours are given wide circulation, the less likelihood of serious harm to the public.

How Inflation Swindles the Equity Investor

May 1977

The central problem in the stock market is that the return on capital hasn't risen with inflation. It seems to be stuck at 12 percent

It is no longer a secret that stocks, like bonds, do poorly in an inflationary environment. We have been in such an environment for most of the past decade, and it has indeed been a time of troubles for stocks. But the reasons for the stock market's problems in this period are still imperfectly understood.

There is no mystery at all about the problems of bondholders in an era of inflation. When the value of the dollar deteriorates month after month, a security with income and principal payments denominated in those dollars isn't going to be a big winner. You hardly need a Ph.D. in economics to figure that one out.

It was long assumed that stocks were something else. For many years, the conventional wisdom insisted that stocks were a hedge against inflation. The proposition was rooted in the fact that stocks are not claims against dollars, as bonds are, but represent ownership of companies with productive facilities. These, investors believed, would retain their value in real terms, let the politicians print money as they might.

And why didn't it turn out that way? The main reason, I believe, is that stocks, in economic substance, are really very similar to bonds.

I know that this belief will seem eccentric to many investors. They will immediately observe that the return on a bond (the coupon) is fixed, while the return on an equity investment (the company's earnings) can vary substantially from one year to another. True enough. But anyone who examines the aggregate returns that have been earned by companies during the postwar years will discover something extraordinary: the returns on equity have in fact not varied much at all.

The coupon is sticky

In the first ten years after the war--the decade ending in 1955--the Dow Jones industrials had an average annual return on year-end equity of 12.8 percent. In the second decade, the figure was 10.1 percent. In the third decade it was 10.9 percent. Data for a larger universe, the FORTUNE 500 (whose history goes back only to the mid-1950's), indicate somewhat similar results: 11.2 percent in the decade ending in 1965, 11.8 percent in the decade through 1975. The figures for a few exceptional years have been substantially higher (the high for the 500 was 14.1 percent in 1974) or lower (9.5 percent in 1958 and 1970), but over the years, and in the aggregate, the return on book value tends to keep coming back to a level around 12 percent. It shows no signs of exceeding that level significantly in inflationary years (or in years of stable prices, for that matter).

For the moment, let's think of those companies, not as listed stocks, but as productive enterprises. Let's also assume that the owners of those enterprises had acquired them at book value. In that case, their own return would have been around 12 percent too. And because the return has been so consistent, it seems reasonable to think of it as an 'equity coupon.'

In the real world, of course, investors in stocks don't just buy and hold. Instead, many try to outwit their fellow investors in order to maximize their own proportions of corporate earnings. This thrashing about, obviously fruitless in aggregate, has no impact on the equity coupon but reduces the investor's portion of it, because he incurs substantial frictional costs, such as advisory fees and brokerage charges. Throw in an

active options market, which adds nothing to the productivity of American enterprise but requires a cast of thousands to man the casino, and frictional costs rise further.

Stocks are perpetual

It is also true that in the real world investors in stocks don't usually get to buy at book value. Sometimes they have been able to buy in below book; usually, however, they've had to pay more than book, and when that happens there is further pressure on that 12 percent. I'll talk more about these relationships later. Meanwhile, let's focus on the main point: as inflation has increased, the return on equity capital has not. Essentially, those who buy equities receive securities with an underlying fixed return--just like those who buy bonds.

Of course, there are some important differences between the bond and stock forms. For openers, bonds eventually come due. It may require a long wait, but eventually the bond investor gets to renegotiate the terms of his contract. If current and prospective rates of inflation make his old coupon look inadequate, he can refuse to play further unless coupons currently being offered rekindle his interest. Something of this sort has been going on in recent years.

Stocks, on the other hand, are perpetual. They have a maturity date of infinity. Investors in stocks are stuck with whatever return corporate America happens to earn. If corporate America is destined to earn 12 percent, then that is the level investors must learn to live with. As a group, stock investors can neither opt out nor renegotiate. In the aggregate, their commitment is actually increasing. Individual companies can be sold or liquidated and corporations can repurchase their own shares; on balance, however, new equity flotations and retained earnings guarantee that the equity capital locked up in the corporate system will increase.

So, score one for the bond form. Bond coupons eventually will be renegotiated; equity 'coupons' won't. It is true, of course, that for a long time a 12 percent coupon did not appear in need of a whole lot of correction.

The bondholder gets it in cash

There is another major difference between the garden variety of bond and our new exotic 12 percent 'equity bond' that comes to the Wall Street costume ball dressed in a stock certificate.

In the usual case, a bond investor receives his entire coupon in cash and is left to reinvest it as best he can. Our stock investor's equity coupon, in contrast, is partially retained by the company and is reinvested at whatever rates the company happens to be earning. In other words, going back to our corporate universe, part of the 12 percent earned annually is paid out in dividends and the balance is put right back into the universe to earn 12 percent also.

The good old days

This characteristic of stocks--the reinvestment of part of the coupon--can be good or bad news, depending on the relative attractiveness of that 12 percent. The news was very good indeed in the 1950's and early 1960's. With bonds yielding only 3 or 4 percent, the right to reinvest automatically a portion of the equity coupon at 12 percent was of enormous value. Note that investors could not just invest their own money and get that 12 percent return. Stock prices in this period ranged far above book value, and investors were prevented by the premium prices they had to pay from directly extracting out of the underlying corporate universe whatever rate that universe was earning. You can't pay far above par for a 12 percent bond and earn 12 percent for yourself.

But on their retained earnings, investors could earn 12 percent. In effect, earnings retention allowed investors to buy at book value part of an enterprise that, in the economic environment then existing, was worth a great deal more than book value.

It was a situation that left very little to be said for cash dividends and a lot to be said for earnings retention. Indeed, the more money that investors thought likely to be reinvested at the 12 percent rate, the more valuable they considered their reinvestment privilege, and the more they were willing to pay for it. In the early 1960's, investors eagerly paid top-scale prices for electric utilities situated in growth areas, knowing that these companies had the ability to reinvest very large proportions of their earnings. Utilities whose operating environment dictated a larger cash payout rated lower prices.

If, during this period, a high-grade, noncallable, long-term bond with a 12 percent coupon had existed, it would have sold far above par. And if it were a bond with a further unusual characteristic--which was that most of the coupon payments could be automatically reinvested at par in similar bonds--the issue would have commanded an even greater premium. In essence, growth stocks retaining most of their earnings represented just such a security. When their reinvestment rate on the added equity capital was 12 percent while interest rates generally were around 4 percent, investors became very happy--and, of course, they paid happy prices.

Heading for the exits

Looking back, stock investors can think of themselves in the 1946-66 period as having been ladled a truly bountiful triple dip. First, they were the beneficiaries of an underlying corporate return on equity that was far above prevailing interest rates. Second, a significant portion of that return was reinvested for them at rates that were otherwise unattainable. And third, they were afforded an escalating appraisal of underlying equity capital as the first two benefits became widely recognized. This third dip meant that, on top of the basic 12 percent or so earned by corporations on their equity capital, investors were receiving a bonus as the Dow Jones industrials increased in price from 133 percent of book value in 1946 to 220 percent in 1966. Such a marking-up process temporarily allowed investors to achieve a return that exceeded the inherent earning power of the enterprises in which they had invested.

This heaven-on-earth situation finally was 'discovered' in the mid-1960's by many major investing institutions. But just as these financial elephants began trampling on one another in their rush to equities, we entered an era of accelerating inflation and higher interest rates. Quite logically, the marking-up process began to reverse itself. Rising interest rates ruthlessly reduced the value of all existing fixed-coupon investments. And as long-term corporate bond rates began moving up (eventually reaching the 10 percent area), both the equity return of 12 percent and the reinvestment 'privilege' began to look different.

Stocks are quite properly thought of as riskier than bonds. While that equity coupon is more or less fixed over periods of time, it does fluctuate somewhat from year to year. Investors' attitudes about the future can be affected substantially, although frequently erroneously, by those yearly changes. Stocks are also riskier because they come equipped with infinite maturities. (Even your friendly broker wouldn't have the nerve to peddle a 100-year bond, if he had any available, as 'safe.')

Because of the additional risk, the natural reaction of investors is to expect an equity return that is comfortably above the bond return--and 12 percent on equity versus, say, 10 percent on bonds issued by the same corporate universe does not seem to qualify as comfortable. As the spread narrows, equity investors start looking for the exits.

But, of course, as a group they can't get out. All they can achieve is a lot of movement, substantial frictional costs, and a new, much lower level of valuation, reflecting the lessened attractiveness of the 12 percent equity coupon under inflationary conditions. Bond investors have had a succession of shocks over

the past decade in the course of discovering that there is no magic attached to any given coupon level: at 6 percent, or 8 percent, or 10 percent, bonds can still collapse in price. Stock investors, who are in general not aware that they too have a 'coupon,' are still receiving their education on this point.

Five ways to improve earnings

Must we really view that 12 percent equity coupon as immutable? Is there any law that says the corporate return on equity capital cannot adjust itself upward in response to a permanently higher average rate of inflation?

There is no such law, of course. On the other hand, corporate America cannot increase earnings by desire or decree. To raise that return on equity, corporations would need at least one of the following: (1) an increase in turnover, i.e., in the ratio between sales and total assets employed in the business; (2) cheaper leverage; (3) more leverage; (4) lower income taxes; (5) wider operating margins on sales.

And that's it. There simply are no other ways to increase returns on common equity. Let's see what can be done with these.

We'll begin with turnover. The three major categories of assets we have to think about for this exercise are accounts receivable, inventories, and fixed assets such as plants and machinery.

Accounts receivable go up proportionally as sales go up, whether the increase in dollar sales is produced by more physical volume or by inflation. No room for improvement here.

With inventories, the situation is not quite so simple. Over the long term, the trend in unit inventories may be expected to follow the trend in unit sales. Over the short term, however, the physical turnover rate may bob around because of special influences--e.g., cost expectations, or bottlenecks.

The use of last-in, first-out (LIFO) inventory-valuation methods serves to increase the reported turnover rate during inflationary times. When dollar sales are rising because of inflation, inventory valuations of a LIFO company either will remain level (if unit sales are not rising) or will trail the rise in dollar sales (if unit sales are rising). In either case, dollar turnover will increase.

During the early 1970's, there was a pronounced swing by corporations toward LIFO accounting (which has the effect of lowering a company's reported earnings and tax bills). The trend now seems to have slowed. Still, the existence of a lot of LIFO companies, plus the likelihood that some others will join the crowd, ensures some further increase in the reported turnover of inventory.

The gains are apt to be modest

In the case of fixed assets, any rise in the inflation rate, assuming it affects all products equally, will initially have the effect of increasing turnover. That is true because sales will immediately reflect the new price level, while the fixed-asset account will reflect the change only gradually, i.e., as existing assets are retired and replaced at the new prices. Obviously, the more slowly a company goes about this replacement process, the more the turnover ratio will rise. The action stops, however, when a replacement cycle is completed. Assuming a constant rate of inflation, sales and fixed assets will then begin to rise in concert at the rate of inflation.

To sum up, inflation will produce some gains in turnover ratios. Some improvement would be certain because of LIFO, and some would be possible (if inflation accelerates) because of sales rising more rapidly than fixed assets. But the gains are apt to be modest and not of a magnitude to produce substantial improvement in returns on equity capital. During the decade ending in 1975, despite generally

accelerating inflation and the extensive use of LIFO accounting, the turnover ratio of the Fortune 500 went only from 1.18/1 to 1.29/1.

Cheaper leverage? Not likely. High rates of inflation generally cause borrowing to become dearer, not cheaper. Galloping rates of inflation create galloping capital needs; and lenders, as they become increasingly distrustful of long-term contracts, become more demanding. But even if there is no further rise in interest rates, leverage will be getting more expensive because the average cost of the debt now on corporate books is less than would be the cost of replacing it. And replacement will be required as the existing debt matures. Overall, then, future changes in the cost of leverage seem likely to have a mildly depressing effect on the return on equity.

More leverage? American business already has fired many, if not most, of the more-leverage bullets once available to it. Proof of that proposition can be seen in some other FORTUNE 500 statistics: in the twenty years ending in 1975, stockholders' equity as a percentage of total assets declined for the 500 from 63 percent to just under 50 percent. In other words, each dollar of equity capital now is leveraged much more heavily than it used to be.

What the lenders learned

An irony of inflation-induced financial requirements is that the highly profitable companies--generally the best credits--require relatively little debt capital. But the laggards in profitability never can get enough. Lenders understand this problem much better than they did a decade ago--and are correspondingly less willing to let capital-hungry, low-profitability enterprises leverage themselves to the sky.

Nevertheless, given inflationary conditions, many corporations seem sure in the future to turn to still more leverage as a means of shoring up equity returns. Their managements will make that move because they will need enormous amounts of capital--often merely to do the same physical volume of business--and will wish to get it without cutting dividends or making equity offerings that, because of inflation, are not apt to shape up as attractive. Their natural response will be to heap on debt, almost regardless of cost. They will tend to behave like those utility companies that argued over an eighth of a point in the 1960's and were grateful to find 12 percent debt financing in 1974.

Added debt at present interest rates, however, will do less for equity returns than did added debt at 4 percent rates in the early 1960's. There is also the problem that higher debt ratios cause credit ratings to be lowered, creating a further rise in interest costs.

So that is another way, to be added to those already discussed, in which the cost of leverage will be rising. In total, the higher costs of leverage are likely to offset the benefits of greater leverage.

Besides, there is already far more debt in corporate America than is conveyed by conventional balance sheets. Many companies have massive pension obligations geared to whatever pay levels will be in effect when present workers retire. At the low inflation rates of 1955-65, the liabilities arising from such plans were reasonably predictable. Today, nobody can really know the company's ultimate obligation. But if the inflation rate averages 7 percent in the future, a twenty-five-year-old employee who is now earning \$12,000, and whose raises do no more than match increases in living costs, will be making \$180,000 when he retires at sixty-five.

Of course, there is a marvelously precise figure in many annual reports each year, purporting to be the unfunded pension liability. If that figure were really believable, a corporation could simply ante up that sum, add to it the existing pension-fund assets, turn the total amount over to an insurance company, and

have it assume all the corporation's present pension liabilities. In the real world, alas, it is impossible to find an insurance company willing even to listen to such a deal.

Virtually every corporate treasurer in America would recoil at the idea of issuing a 'cost-of-living' bond--a noncallable obligation with coupons tied to a price index. But through the private pension system, corporate America has in fact taken on a fantastic amount of debt that is the equivalent of such a bond.

More leverage, whether through conventional debt or unbooked and indexed 'pension debt,' should be viewed with skepticism by shareholders. A 12 percent return from an enterprise that is debt-free is far superior to the same return achieved by a business hocked to its eyeballs. Which means that today's 12 percent equity returns may well be less valuable than the 12 percent returns of twenty years ago.

More fun in New York

Lower corporate income taxes seem unlikely. Investors in American corporations already own what might be thought of as a Class D stock. The Class A, B, and C stocks are represented by the income-tax claims of the federal, state, and municipal governments. It is true that these 'investors' have no claim on the corporation's assets; however, they get a major share of the earnings, including earnings generated by the equity buildup resulting from retention of part of the earnings owned by the Class D shareholders.

A further charming characteristic of these wonderful Class A, B, and C stocks is that their share of the corporation's earnings can be increased immediately, abundantly, and without payment by the unilateral vote of any one of the 'stockholder' classes, e.g., by congressional action in the case of the Class A. To add to the fun, one of the classes will sometimes vote to increase its ownership share in the business retroactively--as companies operating in New York discovered to their dismay in 1975. Whenever the Class A, B, or C 'stockholders' vote themselves a larger share of the business, the portion remaining for Class D--that's the one held by the ordinary investor--declines.

Looking ahead, it seems unwise to assume that those who control the A, B, and C shares will vote to reduce their own take over the long run. The Class D shares probably will have to struggle to hold their own.

Bad news from the FTC

The last of our five possible sources of increased returns on equity is wider operating margins on sales. Here is where some optimists would hope to achieve major gains. There is no proof that they are wrong. But there are only 100 cents in the sales dollar and a lot of demands on that dollar before we get down to the residual, pretax profits. The major claimants are labor, raw materials, energy, and various non-income taxes. The relative importance of these costs hardly seems likely to decline during an age of inflation.

Recent statistical evidence, furthermore, does not inspire confidence in the proposition that margins will widen in a period of inflation. In the decade ending in 1965, a period of relatively low inflation, the universe of manufacturing companies reported on quarterly by the Federal Trade Commission had an average annual pretax margin on sales of 8.6 percent. In the decade ending in 1975, the average margin was 8 percent. Margins were down, in other words, despite a very considerable increase in the inflation rate.

If business was able to base its prices on replacement costs, margins would widen in inflationary periods. But the simple fact is that most large businesses, despite a widespread belief in their market power, just don't manage to pull it off. Replacement cost accounting almost always shows that corporate earnings have declined significantly in the past decade. If such major industries as oil, steel, and aluminum really

have the oligopolistic muscle imputed to them, one can only conclude that their pricing policies have been remarkably restrained.

There you have the complete lineup: five factors that can improve returns on common equity, none of which, by my analysis, are likely to take us very far in that direction in periods of high inflation. You may have emerged from this exercise more optimistic than I am. But remember, returns in the 12 percent area have been with us a long time.

The investor's equation

Even if you agree that the 12 percent equity coupon is more or less immutable, you still may hope to do well with it in the years ahead. It's conceivable that you will. After all, a lot of investors did well with it for a long time. But your future results will be governed by three variables: the relationship between book value and market value, the tax rate, and the inflation rate.

Let's wade through a little arithmetic about book and market value. When stocks consistently sell at book value, it's all very simple. If a stock has a book value of \$100 and also an average market value of \$100, 12 percent earnings by business will produce a 12 percent return for the investor (less those frictional costs, which we'll ignore for the moment). If the payout ratio is 50 percent, our investor will get \$6 via dividends and a further \$6 from the increase in the book value of the business, which will, of course, be reflected in the market value of his holdings.

If the stock sold at 150 percent of book value, the picture would change. The investor would receive the same \$6 cash dividend, but it would now represent only a 4 percent return on his \$150 cost. The book value of the business would still increase by 6 percent (to \$106) and the market value of the investor's holdings, valued consistently at 150 percent of book value, would similarly increase by 6 percent (to \$159). But the investor's total return, i.e., from appreciation plus dividends, would be only 10 percent versus the underlying 12 percent earned by the business.

When the investor buys in below book value, the process is reversed. For example, if the stock sells at 80 percent of book value, the same earnings and payout assumptions would yield 7.5 percent from dividends (\$6 on an \$80 price) and 6 percent from appreciation--a total return of 13.5 percent. In other words, you do better by buying at a discount rather than a premium, just as common sense would suggest.

During the postwar years, the market value of the Dow Jones industrials has been as low as 81 percent of book value (in 1974) and as high as 232 percent (in 1965); most of the time the ratio has been well over 100 percent. (Early this spring, it was around 110 percent.) Let's assume that in the future the ratio will be something close to 100 percent--meaning that investors in stocks could earn the full 12 percent. At least, they could earn that figure before taxes and before inflation.

7 percent after taxes

How large a bite might taxes take out of the 12 percent? For individual investors, it seems reasonable to assume that federal, state, and local income taxes will average perhaps 50 percent on dividends and 30 percent on capital gains. A majority of investors may have marginal rates somewhat below these, but many with larger holdings will experience substantially higher rates. Under the new tax law, as FORTUNE observed last month, a high-income investor in a heavily taxed city could have a marginal rate on capital gains as high as 56 percent. (See 'The Tax Practitioners Act of 1976.')

So let's use 50 percent and 30 percent as representative for individual investors. Let's also assume, in line with recent experience, that corporations earning 12 percent on equity pay out 5 percent in cash dividends

(2.5 percent after tax) and retain 7 percent, with those retained earnings producing a corresponding market-value growth (4.9 percent after the 30 percent tax). The after-tax return, then, would be 7.4 percent. Probably this should be rounded down to about 7 percent to allow for frictional costs. To push our stocks-as-disguised-bonds thesis one notch further, then, stocks might be regarded as the equivalent, for individuals, of 7 percent tax-exempt perpetual bonds.

The number nobody knows

Which brings us to the crucial question--the inflation rate. No one knows the answer on this one--including the politicians, economists, and Establishment pundits, who felt, a few years back, that with slight nudges here and there unemployment and inflation rates would respond like trained seals.

But many signs seem negative for stable prices: the fact that inflation is now worldwide; the propensity of major groups in our society to utilize their electoral muscle to shift, rather than solve, economic problems; the demonstrated unwillingness to tackle even the most vital problems (e.g., energy and nuclear proliferation) if they can be postponed; and a political system that rewards legislators with reelection if their actions appear to produce short-term benefits even though their ultimate imprint will be to compound long-term pain.

Most of those in political office, quite understandably, are firmly against inflation and firmly in favor of policies producing it. (This schizophrenia hasn't caused them to lose touch with reality, however; Congressmen have made sure that their pensions--unlike practically all granted in the private sector--are indexed to cost-of-living changes after retirement.)

Discussions regarding future inflation rates usually probe the subtleties of monetary and fiscal policies. These are important variables in determining the outcome of any specific inflationary equation. But, at the source, peacetime inflation is a political problem, not an economic problem. Human behavior, not monetary behavior, is the key. And when very human politicians choose between the next election and the next generation, it's clear what usually happens.

Such broad generalizations do not produce precise numbers. However, it seems quite possible to me that inflation rates will average 7 percent in future years. I hope this forecast proves to be wrong. And it may well be. Forecasts usually tell us more of the forecaster than of the future. You are free to factor your own inflation rate into the investor's equation. But if you foresee a rate averaging 2 percent or 3 percent, you are wearing different glasses than I am.

So there we are: 12 percent before taxes and inflation; 7 percent after taxes and before inflation; and maybe zero percent after taxes and inflation. It hardly sounds like a formula that will keep all those cattle stampeding on TV.

As a common stockholder you will have more dollars, but you may have no more purchasing power. Out with Ben Franklin ('a penny saved is a penny earned') and in with Milton Friedman ('a man might as well consume his capital as invest it').

What widows don't notice

The arithmetic makes it plain that inflation is a far more devastating tax than anything that has been enacted by our legislatures. The inflation tax has a fantastic ability to simply consume capital. It makes no difference to a widow with her savings in a 5 percent passbook account whether she pays 100 percent income tax on her interest income during a period of zero inflation, or pays no income taxes during years of 5 percent inflation. Either way, she is 'taxed' in a manner that leaves her no real income whatsoever.

Any money she spends comes right out of capital. She would find outrageous a 120 percent income tax, but doesn't seem to notice that 6 percent inflation is the economic equivalent.

If my inflation assumption is close to correct, disappointing results will occur not because the market falls, but in spite of the fact that the market rises. At around 920 early last month, the Dow was up fifty-five points from where it was ten years ago. But adjusted for inflation, the Dow is down almost 345 points--from 865 to 520. And about half of the earnings of the Dow had to be withheld from their owners and reinvested in order to achieve even that result.

In the next ten years, the Dow would be doubled just by a combination of the 12 percent equity coupon, a 40 percent payout ratio, and the present 110 pre-cent ratio of market to book value. And with 7 percent inflation, investors who sold at 1800 would still be considerably worse off than they are today after paying their capital-gains taxes.

I can almost hear the reaction of some investors to these downbeat thoughts. It will be to assume that, whatever the difficulties presented by the new investment era, they will somehow contrive to turn in superior results for themselves. Their success is most unlikely. And, in aggregate, of course, impossible. If you feel you can dance in and out of securities in a way that defeats the inflation tax, I would like to be your broker--but not your partner.

Even the so-called tax-exempt investors, such as pension funds and college endowment funds, do not escape the inflation tax. If my assumption of a 7 percent inflation rate is correct, a college treasurer should regard the first 7 percent earned each year merely as a replenishment of purchasing power. Endowment funds are earning nothing until they have outpaced the inflation treadmill. At 7 percent inflation and, say, overall investment returns of 8 percent, these institutions, which believe they are tax-exempt, are in fact paying 'income taxes' of 87½ percent.

The social equation

Unfortunately, the major problems from high inflation rates flow not to investors but to society as a whole. Investment income is a small portion of national income, and if per capita real income could grow at a healthy rate alongside zero real investment returns, social justice might well be advanced.

A market economy creates some lopsided payoffs to participants. The right endowment of vocal chords, anatomical structure, physical strength, or mental powers can produce enormous piles of claim checks (stocks, bonds, and other forms of capital) on future national output. Proper selection of ancestors similarly can result in lifetime supplies of such tickets upon birth. If zero real investment returns diverted a bit greater portion of the national output from such stockholders to equally worthy and hardworking citizens lacking jackpot-producing talents, it would seem unlikely to pose such an insult to an equitable world as to risk Divine Intervention.

But the potential for real improvement in the welfare of workers at the expense of affluent stockholders is not significant. Employee compensation already totals twenty-eight times the amount paid out in dividends, and a lot of those dividends now go to pension funds, nonprofit institutions such as universities, and individual stockholders who are not affluent. Under these circumstances, if we now shifted all dividends of wealthy stockholders into wages--something we could do only once, like killing a cow (or, if you prefer, a pig)--we would increase real wages by less than we used to obtain from one year's growth of the economy.

The Russians understand it too

Therefore, diminishment of the affluent, through the impact of inflation on their investments, will not even provide material short-term aid to those who are not affluent. Their economic well-being will rise or fall with the general effects of inflation on the economy. And those effects are not likely to be good.

Large gains in real capital, invested in modern production facilities, are required to produce large gains in economic well-being. Great labor availability, great consumer wants, and great government promises will lead to nothing but great frustration without continuous creation and employment of expensive new capital assets throughout industry. That's an equation understood by Russians as well as Rockefellers. And it's one that has been applied with stunning success in West Germany and Japan. High capital-accumulation rates have enabled those countries to achieve gains in living standards at rates far exceeding ours, even though we have enjoyed much the superior position in energy.

To understand the impact of inflation upon real capital accumulation, a little math is required. Come back for a moment to that 12 percent return on equity capital. Such earnings are stated after depreciation, which presumably will allow replacement of present productive capacity--if that plant and equipment can be purchased in the future at prices similar to their original cost.

The way it was

Let's assume that about half of earnings are paid out in dividends, leaving 6 percent of equity capital available to finance future growth. If inflation is low--say, 2 percent--a large portion of that growth can be real growth in physical output. For under these conditions, 2 percent more will have to be invested in receivables, inventories, and fixed assets next year just to duplicate this year's physical output--leaving 4 percent for investment in assets to produce more physical goods. The 2 percent finances illusory dollar growth reflecting inflation and the remaining 4 percent finances real growth. If population growth is 1 percent, the 4 percent gain in real output translates into a 3 percent gain in real per capita net income. That, very roughly, is what used to happen in our economy.

Now move the inflation rate to 7 percent and compute what is left for real growth after the financing of the mandatory inflation component. The answer is nothing--if dividend policies and leverage ratios remain unchanged. After half of the 12 percent earnings are paid out, the same 6 percent is left, but it is all conscripted to provide the added dollars needed to transact last year's physical volume of business.

Many companies, faced with no real retained earnings with which to finance physical expansion after normal dividend payments, will improvise. How, they will ask themselves, can we stop or reduce dividends without risking stockholder wrath? I have good news for them: a ready-made set of blueprints is available.

In recent years the electric-utility industry has had little or no dividend-paying capacity. Or, rather, it has had the power to pay dividends if investors agree to buy stock from them. In 1975 electric utilities paid common dividends of \$3.3 billion and asked investors to return \$3.4 billion. Of course, they mixed in a little solicit-Peter-to-pay-Paul technique so as not to acquire a Con Ed reputation. Con Ed, you will remember, was unwise enough in 1974 to simply tell its shareholders it didn't have the money to pay the dividend. Candor was rewarded with calamity in the marketplace.

The more sophisticated utility maintains--perhaps increases--the quarterly dividend and then asks shareholders (either old or new) to mail back the money. In other words, the company issues new stock. This procedure diverts massive amounts of capital to the tax collector and substantial sums to underwriters. Everyone, however, seems to remain in good spirits (particularly the underwriters).

More joy at A.T.&T.

Encouraged by such success, some utilities have devised a further shortcut. In this case, the company declares the dividend, the shareholder pays the tax, and--presto--more shares are issued. No cash changes hands, although the IRS, spoilsport as always, persists in treating the transaction as if it had.

A.T.&T., for example, instituted a dividend-reinvestment program in 1973. This company, in fairness, must be described as very stockholder-minded, and its adoption of this program, considering the folkways of finance, must be regarded as totally understandable. But the substance of the program is out of Alice in Wonderland.

In 1976, A.T.&T. paid \$2.3 billion in cash dividends to about 2.9 million owners of its common stock. At the end of the year, 648,000 holders (up from 601,000 the previous year) reinvested \$432 million (up from \$327 million) in additional shares supplied directly by the company.

Just for fun, let's assume that all A.T.&T. shareholders ultimately sign up for this program. In that case, no cash at all would be mailed to shareholders--just as when Con Ed passed a dividend. However, each of the 2.9 million owners would be notified that he should pay income taxes on his share of the retained earnings that had that year been called a 'dividend.' Assuming that 'dividends' totaled \$2.3 billion, as in 1976, and that shareholders paid an average tax of 30 percent on these, they would end up, courtesy of this marvelous plan, paying nearly \$700 million to the IRS. Imagine the joy of shareholders, in such circumstances, if the directors were then to double the dividend.

The government will try to do it

We can expect to see more use of disguised payout reductions as business struggles with the problem of real capital accumulation. But throttling back shareholders somewhat will not entirely solve the problem. A combination of 7 percent inflation and 12 percent returns will reduce the stream of corporate capital available to finance real growth.

And so, as conventional private capital-accumulation methods falter under inflation, our government will increasingly attempt to influence capital flows to industry, either unsuccessfully as in England or successfully as in Japan. The necessary cultural and historical underpinning for a Japanese-style enthusiastic partnership of government, business, and labor seems lacking here. If we are lucky, we will avoid following the English path, where all segments fight over division of the pie rather than pool their energies to enlarge it.

On balance, however, it seems likely that we will hear a great deal more as the years unfold about underinvestment, stagflation, and the failures of the private sector to fulfill needs.

WARREN BUFFETT IS IN STOCKS ANYWAY

The author is, in fact, one of the most visible stock-market investors in the U.S. these days. He's had plenty to invest for his own account ever since he made \$25 million running an investment partnership during the 1960's. Buffett Partnership Ltd., based in Omaha, was an immensely successful operation, but he nevertheless closed up shop at the end of the decade. A January, 1970, FORTUNE article explained his decision: 'he... suspects that some of the juice has gone out of the stock market and that sizable gains in the future are going to be very hard to come by.'

Buffett, who is now forty-six and still operating out of Omaha, has a diverse portfolio. He and businesses he controls have interests in over thirty public corporations. His major holdings: Berkshire Hathaway (he owns about \$35 million worth) and Blue Chip Stamps (about \$10 million). His visibility, recently

increased by a Wall Street Journal profile, reflects his active managerial role in both companies, both of which invest in a wide range of enterprises; one is the Washington Post.

And why does a man who is gloomy about stocks own so much stock? 'Partly, it's habit,' he admits. 'Partly, it's just that stocks mean business, and owning businesses is much more interesting than owning gold or farmland. Besides, stocks are probably still the best of all the poor alternatives in an era of inflation--at least they are if you buy in at appropriate prices.'

You pay a very high price in the stock market for a cheery consensus

8/6/1979

What does Buffett think now? In this article he puts it bluntly: Now is the time to buy.

Warren Buffett is a down-to-earth man of 48 who prefers to operate out of his native Omaha rather than in the canyons of Wall Street, but the pros regard him as possibly the most successful living money manager, a direct descendant of the legendary Ben Graham under whom he studied. Buffett made his fortune for himself and his clients in the Fifties and Sixties, threw in the towel in 1969 because he could no longer find bargains. Then in late 1974, when the Dow Jones Industrials were below 600 and the air was thick with doom, he told FORBES: "I feel like an oversexed man in a harem. This is the time to start investing." Within months the greatest rally in history began, with the DJI running almost 450 points in a bit over a year.

Pension fund managers continue to make investment decisions with their eyes firmly fixed on the rearview mirror. This generals-fighting-the-last-war approach has proven costly in the past and will likely prove equally costly this time around.

Stocks now sell at levels that should produce long-term returns far superior to bonds. Yet pensions managers, usually encouraged by corporate sponsors they must necessarily please ("whose bread I eat, his song I sing"), are pouring funds in record proportions into bonds.

Meanwhile, orders for stocks are being placed with an eyedropper. Parkinson—of Parkinson's law fame—might conclude that the enthusiasm of professionals for stocks varies proportionately with the recent pleasure derived from ownership. This always was the way John Q. Public was expected to behave. John Q. Expert seems similarly afflicted. Here's the record.

In 1972, when the Dow earned \$67.11 or 11% on beginning book value of 607, it closed the year selling at 1020 and pension managers couldn't buy stocks fast enough. Purchases of equities in 1972 were 105% of net funds available (ie bonds were sold), a record except for the 1222% of the even more buoyant prior year. The two-year stampede increased the equity portion of total pension assets from 61% to 74%—an alltime record which coincided nicely with a record high price for the Dow. The more investment managers paid for stocks, the better they felt about them.

And then the market went into a tailspin in 1973-1974. Although the Dow earned \$99.04 in 1974, or 14% on beginning book value of 690, it finished the year selling at 616. A bargain? Alas, such bargain prices produced panic rather than purchases; only 21% of net investable funds went into equities that year, a 25-year record low. The proportion of equities held by private noninsured pension plans fell to 54% of net assets, a full 20-point drop from the level deemed appropriate when the Dow was 400 points higher.

By 1976 the courage of pension managers rose in tandem with the price level, and 56% of available funds was committed to stocks. The Dow that year averaged close to 1000, a level then about 25% above book value.

In 1978 stocks were valued far more reasonably, with the Dow selling below book value most of the time. Yet a new low of 9% of net funds was invested in equities during the year. The first quarter of 1979 continued at very close to the same level.

By these actions pension managers, in record-setting manner, are voting for purchase of bonds—at interest rates of 9% to 10%—and against purchase of American equities at prices aggregating book value or less. But these pension managers probably would concede that those American equities, in aggregate

[More Compilations](#)

and over the longer term, would earn about 13% (the average in recent years) on book value. And, overwhelmingly, the managers of their corporate sponsors would agree.

Many corporate managers, in fact, exhibit a bit of schizophrenia regarding equities. They consider their own stocks to be screamingly attractive. But, concomitantly, they stamp approval on pension policies rejecting purchases of common stocks in general. And the boss, while wearing his acquisition hat, will eagerly bid 150% to 200% of book value for businesses typical of corporate America but, wearing his pension hat, will scorn investment in similar companies at book value. Can his own talents be so unique that he is justified both in pay 200 cents on the dollar for a business if he can get his hands on it, and in rejecting it as an unwise pension investment at 100 cents on the dollar if it must be left to be run by his companions at the Business Roundtable?

A simple Pavlovian response may be the major cause of this puzzling behavior. During the last decade stocks have produced pain—both for corporate sponsors and for the investment managers the sponsors hire. Neither group wishes to return to the scene of the accident. But the pain has not been produced because business has performed badly, but rather because stocks have underperformed business. Such underperformance cannot prevail indefinitely, any more than could the earlier overperformance of stocks versus business. Such underperformance cannot prevail indefinitely, any more than could the earlier overperformance of stocks versus business that lured pension money into equities at high prices.

Can better results be obtained over, say, 20 years from a group of 9½% bonds of leading American companies maturing in 1999 than from a group of Dow-type equities purchased, in aggregate, at around book value and likely to earn, in aggregate, around 13% on that book value? The probabilities seem exceptionally low. The choice of equities would prove inferior only if either a major sustained decline in return on equity occurs or a ludicrously low valuation of earnings prevails at the end of the 20-year period. Should price/earnings ratios expand over the 20-year period—and that 13% return on equity be averaged—purchases made now at book value will result in better than a 13% annual return. How can bonds at only 9½% be a better buy?

Think for a moment of book value of the Dow as equivalent to par, or the principal value of a bond. And think of the 13% or so expectable average rate of earnings on that book value as a sort of fluctuating coupon on the bond—a portion of which is retained to add to principal amount just like the interest return on U.S. Savings Bonds. Currently out “Dow Bond” can be purchased at a significant discount (at about 840 vs 940 “principal amount,” or book value of the Dow.)* That Dow Bond purchased at a discount with an average coupon of 13%—even though the coupon will fluctuate with business conditions—seems to be to be a long-term investment far superior to a convention 9½% 20-year bond purchased at par.

Of course there is no guarantee that future corporate earnings *will* average 13%. It may be that some pension managers shun stocks because they expect reported returns on equity to fall sharply in the next decade. However, I don’t believe such a view is widespread.

Instead, investment managers usually set forth two major objections to the thought that stocks should now be favored over bonds. Some say earnings currently are overstated, with real earnings after replacement-value depreciation far less than those reported. Thus, they say, real 13% earnings aren’t available. But that argument ignores the evidence in such investments areas as life insurance, banking, fire-casualty insurance, finance companies, service businesses, etc. In those industries replace-value accounting would produce results virtually identical with those produced by conventional accounting. And yet, one can put together a very attractive package of large companies in those fields with an expectable return of 13% or better on book value and with a price which, in aggregate, approximates book value. Furthermore, I see

no evidence that corporate managers turn their backs on 13% returns in their acquisition decisions because of replacement-value accounting considerations.

A second argument is made that there are just too many question marks about the near future, wouldn't it be better to wait until things clear up a bit? You know the prose: "Maintain buying reserves until current uncertainties are resolved," etc. Before reaching for that crutch, face up to two unpleasant facts: The future is *never* clear; you pay a very high price in the stock market for a cheery consensus. Uncertainty actually is the friend of the buyer of long-term values.

If anyone can afford to have such a long-term perspective in making investment decisions, it should be pension fund managers. While corporate managers frequently incur large obligations in order to acquire businesses at premium prices, most pension plans have very minor flow-of-funds problems. If they wish to invest for the long term—as they do in buying those 20- and 30- year bonds they now embrace—they certainly are in a position to do so. They can, and should, buy stocks with the attitude and expectations of an investor entering in a long-term partnership.

Corporate managers who duck responsibility for pension management by making easy, conventional or faddish decisions are making an expensive mistake. Pension assets probably total about one-third of overall industrial net worth and, of course, bulk far larger in the case of many specific industrial corporations. Thus poor management of those assets frequently equate to poor management of the largest single segment of the business. Soundly achieved higher returns will produce significantly greater earnings for the corporate sponsors and will also enhance the security and prospective payments available to pensioners.

Managers currently opting for lower equity ratios either have a highly negative opinion of future American business results or expect to be nimble enough to dance back into stocks at even lower levels. There may well be some period in the near future when financial markets are demoralized and much better buys are available in equities; that possibility exists at all times. But you can be sure that at such a time the future will seem neither predictable nor pleasant. Those now awaiting a "better time" for equity investing are highly likely to maintain that posture until well into the next bull market.

**Figures are based on the old Dow, prior to the recent substitutions. The returns would be moderately higher and the book values somewhat lower if the new Dow had been used.*

What we can learn from Phil Fisher

10/19/1987

On turning 80 last month the eminent San Francisco investment counselor Philip Fisher was in a valedictory mood. Rarely interviewed, he sat for a long chat with FORBES. He is one of the seminal figures of modern investment thinking—one of the first, if not the first, to develop the thesis that growth stocks have identifiable characteristics that make them different from ordinary stocks.

Warren Buffett, perhaps the most successful investor of the present era, calls Fisher a “giant.”

Horse handicappers fall into two major categories: speed and class. The speed dopester wants lots of figures: He pores over the form sheet to determine which horse posted the fastest time in recent races, adjusted for track conditions, weight carried, etc. The class handicapper scorns numbers. “Tell me about bloodlines and the quality of past opposition,” he says.

These differing doctrines have their parallel in the investment world—between analysts emphasizing quantitative factors and those who favor a qualitative approach. The quantitative analyst says, “Let’s buy the cheapest stock as measured by some combination of price/earnings ratio, book value, yield, etc.”

The qualitative analyst says, “Buy the best company, the best management and don’t worry too much about the numbers.”

Happily, there’s more than one way to get to financial heaven. Skilled and insightful practitioners of either persuasion will be rewarded. I was lucky to find good men of both persuasions early in my life, and the resulting synthesis of their ideas has been of enormous benefit to me.

I sought out Phil Fisher after reading his *Common Stocks and Uncommon Profits* and *Paths to Wealth Through Common Stocks* in the early 1960s.

When I met him, I was as impressed by the man as by his ideas. Much like Ben Graham, Fisher was unassuming, generous in spirit and an extraordinary teacher. From him I learned the value of the “scuttlebutt” approach: Go out and talk to competitors, suppliers, customers to find out how an industry or a company really operates. A thorough understanding of the business, obtained by using Phil’s techniques, combined with the quantitative discipline taught by Ben, will enable one to make intelligent investment commitments. I am an eager reader of whatever Phil has to say, and I recommend him to you.

Early fears about index futures

12/7/1987

One of America's best investors warned in 1982 that stock index futures were bad news for the markets.

Buffett wrote the following letter to John Dingell, chairman of the House subcommittee on oversight and investigations, in March 1982 when Congress was considering whether to allow the Chicago Mercantile Exchange to trade futures contracts tied to the level of stock indexes such as Standard & Poor's 500. Some critics argue that futures trading helped feed the October 19 stock market crash. Buffett stands by the views he expressed five years ago.

This letter is to comment upon the likely sources for trading activity that will develop in any futures market involving stock indexes. My background for this commentary is some 30 years of practice in various aspects of the investment business, including several years as a securities salesman. The last 25 years have been spent as a financial analyst, and I currently have the sole responsibility for an equity portfolio that totals over \$600 million.*

It is impossible to predict precisely what will develop in investment of speculative markets, and you should be wary of any who claim precision. I think the following represents a reasonable expectancy:

(1) A role can be performed by the stock index future contract in aiding the risk-reducing efforts of the true investor. An investor may quite logically conclude that he can identify undervalued securities, but also conclude that he has no ability whatsoever to predict the short-term movements of the stock market. This is the view I maintain in my own efforts in investment management. Such an investor may wish to "zero out" market fluctuations, and the continual shorting of a representative index offers him the chance to do just that. Presumably, an investor with \$10 million in the index will achieve the net rewards or penalties attributable solely to his skill in selection of specific securities, and have no worries that these results will be swamped—or even influenced—by the fluctuations of the general market. Because there are costs involved—and because most investors believe that, over the long term, stock prices in general will advance—I think there are relatively few investment professionals who will operate in such a constantly hedge manner. But I also believe that it is a rational way to behave and that a few professionals, who wish always to be "market neutral" in their attitude and behavior, will do so.

**It is now worth more than \$2.5 billion.*

(2) As previously stated, I see a logical risk-reducing strategy that involves shorting the futures contract. I see no corresponding investment or hedging strategy whatsoever on the long side. BY definition, therefore, a very maximum of 50% of the futures transactions can be entered into with the expectancy of risk reduction, and not less than 50% (the long side) must act in a risk-accentuating or gambling manner.

(3) The actual balance would be enormously different from this maximum fifty-fifty division between risk reducers and risk accentuators. The propensity to gamble is always increased by a large prize vs. a small entry fee, no matter how poor the true odds may be. That's why Las Vegas casinos advertise big jackpots and why state lotteries headline big prizes. In securities, the unintelligent are seduced by the same approach in various ways, including: (a) "penny stocks," which are "manufactured" by promoters precisely because they snare the gullible—creating dreams of enormous payoffs but with an actual group result of disaster, and (b) low margin requirements through which financial experience attributable to a large investment is achieved by committing a relatively small stake.

(4) We have had many earlier experiences in our history in which the high total commitment/low down payment phenomenon has led to trouble. The most familiar, of course, is the stock market boom in the late Twenties, which was accompanied and accentuated by 10% margins. Saner heads subsequently decided that there was nothing pro-social about such thin-margined speculation, and that rather than aiding capital markets, in the long run it hurt them. Accordingly, margin regulations were introduced and made a permanent part of the investing scene. The ability to speculate in stock indexes with 10% down payments, of course, is simply a way around the margin requirements and will be immediately perceived as such by gamblers throughout the country.

(5) Brokers, of course, favor new trading vehicles. Their enthusiasm tends to be in direct proportion to the amount of activity they expect. And the more the activity, the greater the cost to the public and the greater the amount of money that will be left behind by them to be spread among the brokerage industry. As each contract dies, the only business involved is that the loser pays the winner. Since the casino (the futures market and its supporting cast of brokers) gets paid a toll each time one of these transactions takes place, you can be sure that it will have a great interest in providing very large numbers of losers and winners. But it must be remembered that for the players it is the most clear sort of a “negative sum game.” Losses and gains cancel out before expenses; after expenses the net loss is substantial. In fact, unless such losses are quite substantial, the casino will terminate operations since the players’ net losses compose the casino’s sole source of revenue. This “negative sum” aspect is in direct contrast to common stock investment generally, which has been a very substantial “positive sum game” over the years simply because the underlying companies, on balance, have earned substantial sums of money that eventually benefit their owners, the stockholders.

(6) In my judgment, a very high percentage—probably at least 95% and more likely much higher—of the activity generated by these contracts will be strictly gambling in nature. You will have people wagering as to the short-term market of the stock market and able to make fairly large wagers with fairly small sums. They will be encouraged to do so by brokers who will see rapid turnover of customers’ capital—the best thing that can happen to a broker in terms of his immediate income. A great deal of money will be left behind by these 95% as the casino takes its bite from each transaction.

(7) In the long run, gambling-dominated activities that are identified with traditional capital markets, and that leave a very high percentage of those exposed to the activity burned, are not going to be good for capital market. Even though people participating in such gambling activity are not investors and what they are buying really are not stocks, they still will feel that they have had a bad experience with the stock market. And after having been exposed to the worst face of capital markets, they understandably may, in the future, take a dim view of capital markets generally. Certainly that has been the experience after previous waves of speculation. You might ask if the brokerage industry is not wise enough to look after its own long-term interests. History shows brokers to be myopic (witness the late Sixties); they often have been happiest when behavior was at its silliest. And many brokers are far more concerned with how much they gross this month than whether their clients—or for that matter, the securities industry—prosper in the long run.

WE DO NOT NEED more people gambling in nonessential instruments identified with the stock market in this country, nor brokers who encourage them to do so. What we need are investors and advisers who look at the long-term prospects for an enterprise and invest accordingly. We need the intelligent commitment of investment capital, not leveraged market wagers. The propensity to operate in the intelligent, pro-social sector of capital markets is deterred, not enhanced, by an active and exciting casino operating in somewhat the same arena, utilizing somewhat similar language and serviced by the same work force.

In addition, low-margined activity in stock equivalents is inconsistent with expressed public policy as embodied in margin requirements. Although index futures have slight benefits to the investment professional wishing to “hedge out” the market, the net effect of high-volume futures markets in stock indexes is likely to be overwhelmingly detrimental to the security-buying public and, therefore, in the long run to capital markets generally.

The Bill and Warren Show

7/20/1998

What do you get when you put a billionaire buddy act in front of 350 students? \$84 billion of inspiration

In a meeting of incomparable minds (and unspendable net worth), Buffett and Gates muse about taking risks, motivating employees, confronting mistakes, and giving back. The result: something pretty darn close to wisdom.

The queue of students stretched through the lobby and out the door of the University of Washington's Husky Union Building in Seattle on a balmy Friday afternoon in late May. You could tell by the abundance of pressed chinos and dress shirts (and the shortage of nose rings) that this wasn't the ticket line for a Phish concert. Instead, the well-groomed group was staking out prime seats for, of all things, a lecture--albeit a very special lecture. The students and a few lucky guests were to be treated to a rare, public dialogue between the two richest businessmen in the solar system: Microsoft founder and CEO Bill Gates and Warren Buffett, chairman of Berkshire Hathaway Inc.

The billionaire buddies conceived the event to coincide with Buffett's weekend visit to Gates' home, following Microsoft's annual summit meeting for CEOs. The superinvestor and the cybertycoon asked some 350 business school students to participate in the session and invited the Public Broadcasting System and FORTUNE to document the affair. (PBS filmed the interchange and will offer copies to its affiliates for broadcast during pledge drives this fall.)

While the students milled downstairs, Gates and Buffett bantered with their wives and a small group of friends that included, among others, Katharine Graham, the former CEO of the Washington Post Co., and Bill's dad and sister. They noshed on fresh fruit in a makeshift greenroom while a makeup artist powdered Bill's nose and trimmed Warren's unruly eyebrows, much to Susie Buffett's amusement. At one point the Oracle of Omaha entertained the group with a goofy imitation of Richard Nixon's "V for victory" sign.

As showtime approached, the two gamely posed for photos and traded barbs like old college roomies. The other guests' main concern was that the titans not be too long-winded, so everyone could get back to Gates' house in time to play bridge. It felt like a convivial family reunion--granted, of one very high-powered family.

For a guest in that greenroom, perhaps the most lasting impression was the cross-generational affection between America's best-known billionaires. (For the record, on that day the 42-year-old Gates' net worth hovered around \$48 billion, compared with Buffett's \$36 billion. Buffett, who only a few years ago was considerably richer than Gates, has managed to remain 25 years older, though.) Buffett's presence seemed to calm Gates, who acted loose and gregarious despite Microsoft's legal fisticuffs with federal trustbusters and the stress of hosting several dozen prominent CEOs for the previous two days. Although Bill has finally begun to look his age--nascent crow's-feet now crease the corners of his eyes, and he's no longer the beanpole he was--the Buffetts and Graham still dote on him like a wunderkind. He, in turn, treats them with a warm hint of deference, quite a contrast to his usual debater's demeanor.

Finally the two made their way to the stage, pausing in the wings for University of Washington Business School dean Bill Bradford's introduction. Unfortunately, the dean's remarks, which mainly praised Microsoft for hiring University of Washington students, missed the point. The funny, philosophical, extraordinary conversation that followed would be much more than a pep talk from a local employer and his pal. See for yourself.

[More Compilations](#)

1. How We Got Here Warren and Bill explain how they became richer than God.

BUFFETT: I thought I ought to start this off by announcing that Bill and I have a small bet as to who would get the most applause. I suggested that I bet my house against his. We settled on a small sum, but evidently it isn't such a small sum to Bill, because just before we came out he gave me this Nebraska Cornhusker shirt to wear, and then he puts on this purple University of Washington shirt himself.

They've asked us to start out talking, the two of us, about what got us here, but then it's on to your questions. How I got here is pretty simple in my case. It's not IQ, I'm sure you'll be glad to hear. The big thing is rationality. I always look at IQ and talent as representing the horsepower of the motor, but that the output--the efficiency with which that motor works--depends on rationality. A lot of people start out with 400-horsepower motors but only get a hundred horsepower of output. It's way better to have a 200-horsepower motor and get it all into output.

So why do smart people do things that interfere with getting the output they're entitled to? It gets into the habits and character and temperament, and behaving in a rational manner. Not getting in your own way. As I said, everybody here has the ability absolutely to do anything I do and much beyond. Some of you will, and some of you won't. For the ones who won't, it will be because you get in your own way, not because the world doesn't allow you.

So I have one little suggestion for you: Pick out the person you admire the most, and then write down why you admire them. You're not to name yourself in this. And then put down the person that, frankly, you can stand the least, and write down the qualities that turn you off in that person. The qualities of the one you admire are traits that you, with a little practice, can make your own, and that, if practiced, will become habit-forming.

The chains of habit are too light to be felt until they are too heavy to be broken. At my age, I can't change any of my habits. I'm stuck. But you will have the habits 20 years from now that you decide to put into practice today. So I suggest that you look at the behavior that you admire in others and make those your own habits, and look at what you really find reprehensible in others and decide that those are things you are not going to do. If you do that, you'll find that you convert all of your horsepower into output.

GATES: I think Warren's absolutely right about habit. I was lucky enough when I was quite young to have an exposure to computers, which were very expensive and kind of limited in what they could do, but still they were fascinating. Some friends of mine and I talked about that a lot and decided that, because of the miracle of chip technology, they would change into something that everybody could use. We didn't see any limit to the computer's potential, and we really thought writing software was a neat thing. So we hired our friends who wrote software to see what kind of a tool this could really be--a tool for the Information Age that could magnify your brainpower instead of just your muscle power.

By pursuing that with a pretty incredible focus and by being there at the very beginning of the industry, we were able to build a company that has played a very central role in what's been a pretty big revolution. Now, fortunately, the revolution is still at the beginning. It was 23 years ago when we started the company. But there's no doubt that if we take the habits we formed and stick with them, the next 23 years should give us a lot more potential and maybe even get us pretty close to our original vision--"a computer on every desk and in every home."

I was wondering how you define success, personally?

BUFFETT: I can certainly define happiness, because happy is what I am. I get to do what I like to do every single day of the year. I get to do it with people I like, and I don't have to associate with anybody

who causes my stomach to churn. I tap-dance to work, and when I get there I think I'm supposed to lie on my back and paint the ceiling. It's tremendous fun. The only thing in my job that I don't like--and this just happens every three or four years--is that occasionally I have to fire somebody.

They say success is getting what you want and happiness is wanting what you get. I don't know which one applies in this case, but I do know I wouldn't be doing anything else. I'd advise you that when you go out to work, work for an organization of people you admire, because it will turn you on. I always worry about people who say, "I'm going to do this for ten years; I really don't like it very well. And then I'll do this...." That's a little like saving up sex for your old age. Not a very good idea.

I have turned down business deals that were otherwise decent deals because I didn't like the people I would have to work with. I didn't see any sense in pretending. To get involved with people who cause your stomach to churn--I say it's a lot like marrying for money. It's probably a bad idea under any circumstances, but it's absolutely crazy if you're already rich, right?

GATES: I agree that the key point is that you've got to enjoy what you do every day. For me, that's working with very smart people and it's working on new problems. Every time we think, "Hey, we've had a little bit of success," we're pretty careful not to dwell on it too much because the bar gets raised. We've always got customer feedback telling us that the machines are too complicated and they're not natural enough. The competition, the technological breakthroughs, and the research make the computer industry, and in particular software, the most exciting field there is, and I think I have the best job in that business.

BUFFETT: Don't you think Dairy Queen is more important than that? [Berkshire Hathaway bought International Dairy Queen last fall, for \$585 million.]

GATES: You can manage Dairy Queen, Warren. I'll go and buy the Dilly Bars.

BUFFETT: We'll raise the price when you come.

Starting a new company is very risky. How do you determine when is the best opportunity to start a new company?

GATES: When I started Microsoft, I was so excited that I didn't think of it as being all that risky. It's true, I might have gone bankrupt, but I had a set of skills that were highly employable. And my parents were still willing to let me go back to Harvard and finish my education if I wanted to.

BUFFETT: You've always got a job with me, Bill.

GATES: The thing that was scary to me was when I started hiring my friends, and they expected to be paid. And then we had customers that went bankrupt--customers that I counted on to come through. And so I soon came up with this incredibly conservative approach that I wanted to have enough money in the bank to pay a year's worth of payroll, even if we didn't get any payments coming in. I've been almost true to that the whole time. We have about \$10 billion now, which is pretty much enough for the next year.

Anyway, if you're going to start a company, it takes so much energy that you'd better overcome your feeling of risk. Also, I don't think that you should necessarily start a company at the beginning of your career. There's a lot to be said for working for a company and learning how they do things first. In our case, Paul Allen and I were afraid somebody else might get there before us. It turned out we probably could've waited another year, in fact, because things were a little slow to start out, but being on the ground floor seemed very important to us.

How do you get people to support you?

GATES: At first you'll run into some skepticism. If you're young, it's hard to go lease premises. You couldn't rent a car when you were under 25, so I was always taking taxis to go see customers. When people would ask me to go have discussions in the bar, well, I couldn't go to the bar.

That's fun, because when people are first skeptical, they say, "Oh, this kid doesn't know anything." But when you show them you've really got a good product and you know something, they actually tend to go overboard. So, at least in this country, our youth was a huge asset for us once we reached a certain threshold.

2. The World Is Our Oyster Why Warren is sure everyone in China will want to drink Coke.

How do you as businessmen take your companies global?

BUFFETT: [At Berkshire Hathaway] we don't take our businesses global directly. Our two largest commitments are Coke and Gillette. Coke has 80% of its earnings coming from abroad, and Gillette has two-thirds of its earnings coming from abroad. So they are participating in a worldwide improvement in living standards, and we go global by piggybacking on them. I can sit in Omaha and let Doug Ivester [CEO of Coca-Cola] fly all over the world.

GATES: Our business is truly global. The PC standard is a global standard. What you need in a spreadsheet in Korea or Egypt is about the same as what you need in the U.S. We have to do some adaptation for the local languages, and that's a fun part of our business--understanding bi-directional languages and the large alphabets that you have in Chinese, Japanese, and Korean.

In fact, our market share is much higher outside the U.S. than it is inside, because it's relatively hard to set up local subsidiaries and to understand local conditions, local distribution and relationships. Since most of our competitors are from the U.S. and aren't as good at doing international business, we thrive even better in these other countries.

Most of our growth will come from outside the U.S. Here it will get to the point where it is largely a replacement market. Now, that doesn't mean U.S. customers don't want better software that can see, listen, and learn. But outside the U.S. we still have that early-growth-slope phenomenon.

What impelled you to make a trip together to China in 1995, and how has that trip affected your global business decisions since?

GATES: We went to China for a lot of reasons. Partly to relax and have fun. We found a few McDonald's there, so we didn't feel too far away from home. It was also exciting to go and see all the changes taking place, to see different parts of the country, and to meet some of the leaders.

China is a market that Microsoft had already been investing in. We've upped that a lot since then. As a percentage of our sales, though, it's tiny--well under 1%--and so even though it will double every year for the next five years, it's really only by taking a ten-year view that we can say it's worth the emphasis we're putting on it.

Although about three million computers get sold every year in China, people don't pay for the software. Someday they will, though. And as long as they're going to steal it, we want them to steal ours. They'll get sort of addicted, and then we'll somehow figure out how to collect sometime in the next decade.

BUFFETT: My family was amazed that I went. I never traveled beyond the outer reaches of the county in Nebraska. I had a terrific time and also confirmed my feeling that there's going to be a lot of Coca-Cola sold there in the future. I told everyone over there that it acts as an aphrodisiac.

3. Innovations "r" Us Warren ponders Internet chewing gum.

Both of you are innovators in your given industries. I was wondering what your definition of innovation is?

BUFFETT: I don't do a lot of innovating in my work. I really have just two functions: One is to allocate capital, which I enjoy doing. And the second one is to help 15 or 20 senior managers keep a group of people enthused about what they do when they have no financial need whatsoever to do it. At least three-quarters of the managers that we have are rich beyond any possible financial need, and therefore my job is to help my senior people keep them interested enough to want to jump out of bed at six o'clock in the morning and work with all of the enthusiasm they did when they were poor and starting. If I do those two things, they do the innovation.

GATES: The technology business has a lot of twists and turns. Probably the reason it's such a fun business is that no company gets to rest on its laurels. IBM was more dominant than any company will ever be in technology, and yet they missed a few turns in the road. That makes you wake up every day thinking, "Hmm, let's try to make sure today's not the day we miss the turn in the road. Let's find out what's going on in speech recognition, or in artificial intelligence. Let's make sure we're hiring the kinds of people who can pull those things together, and let's make sure we don't get surprised."

Sometimes we do get taken by surprise. For example, when the Internet came along, we had it as a fifth or sixth priority. It wasn't like somebody told me about it and I said, "I don't know how to spell that." I said, "Yeah, I've got that on my list, so I'm okay." But there came a point when we realized it was happening faster and was a much deeper phenomenon than had been recognized in our strategy. So as an act of leadership I had to create a sense of crisis, and we spent a couple of months throwing ideas and E-mail around, and we went on some retreats. Eventually a new strategy coalesced, and we said, "Okay, here's what we're going to do; here's how we're going to measure ourselves internally; and here's what the world should think about what we're going to do."

That kind of crisis is going to come up every three or four years. You have to listen carefully to all the smart people in the company. That's why a company like ours has to attract a lot of people who think in different ways, it has to allow a lot of dissent, and then it has to recognize the right ideas and put some real energy behind them.

Which countries and companies are best prepared to take advantage of the information age that is revolutionizing society?

BUFFETT: When you think about it, 15 years ago this country almost had an inferiority complex about its ability to compete in the world.

GATES: Everybody was talking about how the Japanese had taken over consumer electronics and that the computer industry was going to be next, and that their system of hard work somehow was superior, and that we had to completely rethink what we were doing. Now, if you look at what's happened in personal computers or in business in general, or at how we allocate capital, and how we let labor move around, the U.S. has emerged in a very strong position. And so the first beneficiary of all this information technology has been the U.S.

In places like Singapore, Hong Kong, and the Scandinavian countries, people are adopting the technology at basically the same rate that we are. And there are a few countries that, relative to their level of income, are going after the technology at an even higher rate than we are because they believe so much in

education. In Korea and in many parts of China we see incredible penetration of personal computers even at very low income levels, because people there have decided it's a tool to help their kids get ahead.

The whole world is going to benefit in a big way. There will be this shift where, instead of your income level being determined by what country you are from, it will be determined by your education level. Today, a Ph.D. in India doesn't make nearly as much as a Ph.D. in the U.S. When we get the Internet allowing services and advice to be transported as efficiently as goods are transported via shipping, then you'll get essentially open-market bidding for that engineer in India vs. an engineer here in the U.S. And that benefits everyone, because you're taking better advantage of those resources. So the developed countries will get the early benefit of these things. But in the long run, the people in developing countries who are lucky enough to get a good education should get absolutely the biggest boost from all this.

BUFFETT: I didn't grasp it at first, but it's huge. The technological revolution will change the world in dramatic ways, and quickly. Ironically, however, our approach to dealing with that is just the opposite of Bill's. I look for businesses in which I think I can predict what they're going to look like in ten or 15 or 20 years. That means businesses that will look more or less as they do today, except that they'll be larger and doing more business internationally.

So I focus on an absence of change. When I look at the Internet, for example, I try and figure out how an industry or a company can be hurt or changed by it, and then I avoid it. That doesn't mean I don't think there's a lot of money to be made from that change, I just don't think I'm the one to make a lot of money out of it.

Take Wrigley's chewing gum. I don't think the Internet is going to change how people are going to chew gum. Bill probably does. I don't think it's going to change the fact that Coke will be the drink of preference and will gain in per capita consumption around the world; I don't think it will change whether people shave or how they shave. So we are looking for the very predictable, and you won't find the very predictable in what Bill does. As a member of society, I applaud what he is doing, but as an investor, I keep a wary eye on it.

GATES: This is an area where I agree strongly with Warren. I think the multiples of technology stocks should be quite a bit lower than the multiples of stocks like Coke and Gillette, because we are subject to complete changes in the rules. I know very well that in the next ten years, if Microsoft is still a leader, we will have had to weather at least three crises.

4. See You in Court! Bill and Warren talk about tangling with trustbusters.

What is the appropriate role for antitrust law in American business?

BUFFETT: We had one civil antitrust case at the Buffalo Evening News in 1977. And believe it or not, in the Salomon situation in 1991, in addition to having problems with the Federal Reserve in New York, and the SEC, and the U.S. Treasury, and the U.S. Attorney for the Southern District of New York, we also had the Department of Justice antitrust division after us. I don't know what happened to the Bureau of Indian Affairs. They missed us for some reason. Those are the only two experiences I had, and in neither case did I feel that we had done anything wrong. I might add that there was never any adjudication against us either time.

I am no antitrust scholar. I met Bill eight years ago, and he's a terrific teacher. He spent six or seven hours explaining Microsoft to me. Here I am the world's biggest dummy on technology, and he explained it to me pretty darn well. When he got through with it, I bought a hundred shares of stock so I could keep track

of it. That shows two things: One is that I've got an IQ of about 50, and the second is that I didn't think he had any monopoly.

GATES: The key role of competition law is to protect consumers and to make sure that new products get created and that those products are very innovative. And you can look at different sectors of the economy and ask, "where is that happening very well?" No matter how you score it, there's no doubt that one sector of economy would stand out as absolutely the best, and that's the personal computer industry. I don't say the computer industry at large, because you have to remember that before personal computers came along, the structure was very different. People were stuck. Once you bought a computer from Digital or IBM or Hewlett-Packard or anyone else, the software that you created only ran on that computer.

The vision of Microsoft was that all of these computers would work the same. The reason for that is that if you want to get a lot of great software, you have to have a lot of computers out there--millions and millions of them. So you've got to make them cheap, and make them so you don't have to test the software on all the different ones. The goal of the PC industry was to have every company competing to make the most portable one, or the fastest one, or the cheapest one. That would be great for consumers, and it would spark a big software market.

The price of computing before the PC came along was going down at a certain rate, and since the PC came along it's gone down at an incredible rate. The variety and quality of software has also increased at a phenomenal rate. We're absolutely at the peak of that today. The number of new software companies being started, the number of new jobs being created, the level of investment, the number of companies going public, you name it. It's way beyond even what it was three years ago. So consumers are doing very well.

Part of the PC dynamic is that instead of asking software developers to duplicate one another's work, we take anything that's typical in all those applications and put those features in Windows. So for things like connecting to the Internet, instead of everybody having to do that themselves, we put that in. That's been the evolution--graphical user interfaces came in, hard-disk support, networking support, now Internet support, including the browser.

I think antitrust laws as written are fine. There are people who will debate whether they should be weaker, but that's of academic interest. When I come in to do business, I'm very careful to check with our lawyers to be sure we're steering a hundred miles away from anything that would be questionable. So it is somewhat of a surprise to find ourselves in an antitrust controversy. Thank goodness for the judiciary, which is an environment in which facts are tested and people can see if competition worked in the way it should and has been beneficial to consumers. There's no doubt in our minds where that is going to come out.

In the meantime, we're going to be the focus of a lot of controversy because the filing of a lawsuit is a very big deal. You've got the government taking on that challenge and saying a lot of righteous things, and that's just something we'll have to be sure doesn't distract us from what we're really all about.

5. What's a Company Really Worth? Warren explains why Berkshire stock costs more than a Lexus.

Mr. Buffett, I was told that you have a policy against splitting stock, and I wondered if you might comment on Microsoft's history of splitting stock?

BUFFETT: I've never really felt that if I went into a restaurant and said, "I want two hatchecks instead of one for my hat," I'd really be a lot better off. But I also don't have any quarrel with companies that do split their stock, and I don't think Microsoft's been hurt by it.

I think that our policy fits us very well. There's nothing in my religious upbringing that causes me to recoil from stock splits. I'm on the boards of three companies, two of which have split their stock in the last couple of years. I happen to think that by not splitting Berkshire stock, we attract a slightly more long-term-oriented group of investors. What you want to do is attract shareholders that are very much like you, with the same time horizons and expectations. We don't talk about quarterly earnings, we don't have an investor relations department, and we don't have conference calls with Wall Street analysts, because we don't want people who are focusing on what's going to happen next quarter or even next year. We want people to join us because they want to be with us until they die.

If I were to split the stock dramatically, would I change that shareholder composition much? No, but I'd change it just a little. And remember, all the shareholder seats are filled, just like this auditorium. If I say something that offends all of you, and you all leave and another group comes in, am I better off or worse off? Well, that depends upon what they're like and what you're like. But I think I already have a very good group of shareholders who are attracted to these policies, and I think this policy reinforces it slightly.

GATES: Warren has done something admirable by signaling to people that it's a "different stock" and that they ought to think of Berkshire Hathaway as being a little different from your typical company. Having that unusual stock price is probably a good thing, as long as the newspaper doesn't screw it up. He's caused a lot of problems, you know, with the widths of those columns in the stock tables.

Mr. Buffett, what's your response to those who say that traditional methods for valuing companies are obsolete in this market?

BUFFETT: I think it's hard to find companies that meet our tests of being undervalued in this market, but I don't think that the methods of valuation have changed. It's just that in some markets, like in the mid-1970s, every security you looked at was really dramatically undervalued.

I once ran an investment partnership for about 13 years, ending in 1969, and closed it up because I couldn't find anything. I hadn't lost the ability to value companies; there just weren't any left that were cheap enough, and I wasn't in the business of shorting stocks.

But I think that there's no magic to evaluating any financial asset. A financial asset means, by definition, that you lay out money now to get money back in the future. If every financial asset were valued properly, they would all sell at a price that reflected all of the cash that would be received from them forever until Judgment Day, discounted back to the present at the same interest rate. There wouldn't be any risk premium, because you'd know what coupons were printed on this "bond" between now and eternity. That method of valuation is exactly what should be used whether you're in 1974 or you're in 1998. If I can't do that, then I don't buy. So I'll wait.

Would you look for a higher price-to-earnings ratio at this point than you did in 1969?

BUFFETT: That ratio would be affected by interest rates. The difference between now and 1969 or any other time, in terms of calculating a valuation, wouldn't be affected by anything else. Now, if you looked at the overall market, returns on equity are much higher than they were in 1969 or 1974, or any other time in history. So if you're going to say you're going to value the overall market, the question becomes: "Do you crank in the present 20% returns on equity for American business in aggregate, and say that's a realistic figure to stick on for this future that runs out until eternity?" I'd say that's a fairly reckless

assumption and doesn't leave much margin of safety. And I would say that present market levels discount a lot of that, and so that makes me quite cautious.

Do you feel that technology has made businesses more efficient to the point that you can pay more for them?

GATES: There's definitely a one-time lift when you start using technology, and particularly if U.S. companies are using it better than their competitors outside the U.S. You get the ability to communicate better, and you get global scale in a lot of businesses that wouldn't have had it before.

When you look at the really big earners, the ones generating this 20% return on equity and going to that worldwide marketplace--companies like Coca-Cola or Microsoft or Boeing or GE--I know that every one of those has been helped by technology. But that cannot explain why ten years from now they'd be getting that kind of return on equity. Almost certainly there's something ephemeral about current conditions.

BUFFETT: I'm sure technology has made companies more efficient, and if I thought otherwise, I'd be afraid to say so with Bill sitting right here beside me. But the question you might ponder is this: Let's just say that I found a way to clone Jack Welch, and ran off 499 clones of him. Jack continued to run General Electric, and these other 499 ran the rest of the FORTUNE 500. Is the FORTUNE 500 going to have a higher return on equity five years from now or not?

I don't think the answer to that is easy. Because if you get 500 Jack Welches out there, they are going to be doing things in a competitive way that may well produce lower returns for American business than if you've got a bunch of clods out there and a guy like Jack competing with them. If you've got great variation in the quality of management, it improves the chances enormously of a relatively significant number getting terrific returns.

So I would say that a lot of things in business, including technology, really have the same effect as if you went to a parade and the band started coming down the street and all of a sudden you stood up on tiptoe. In another 30 seconds everybody else is on tiptoe, and it would be hell on your legs and you still wouldn't be seeing any better.

Capitalism tends to be self-neutralizing like that in terms of improvements. That's marvelous because it means we have better everything than otherwise. But the real trick is to stand up on tiptoe and not have anyone notice you.

The recent wave of mergers has been staggering. Could you comment on how any of these mergers will create value for shareholders?

BUFFETT: Actually, the two of us have a small announcement we would like to make... [laughter].

It won't stop. Mergers will be motivated by very good considerations. There truly are synergies in a great many mergers. But whether there are synergies or not, they are going to keep happening. You don't get to be the CEO of a big company by being a milquetoast. You are not devoid of animal spirits. And it gets contagious. I've been a director of 19 different public companies over the years, and I can tell you that the conversation turns to acquisitions and mergers much more when the competitors of the particular company are engaging in those. As long as our economy works the way it does--and I think it works very well--you're going to see a lot of it. A generally buoyant market tends to encourage mergers, because everybody's currency is more useful in those circumstances. [A few weeks later, Berkshire Hathaway agreed to pay \$23.5 billion in stock to acquire General Re, the world's third-largest reinsurance company.]

GATES: I think it's good to have a healthy skepticism. But General Motors was created out of a restructuring of the automobile industry from a specialized orientation to companies that did the whole job. And anybody who missed that was basically wiped out.

We've bought a lot of small companies, and I'd say that's been vital to us. These are companies that on their own probably wouldn't have made it, but when their abilities are combined with ours, both of us were able to create a much better set of products than we could've otherwise.

I think in banking today, if you're a medium-sized bank, you're probably going to need to participate in all this stuff that's going on. It doesn't make that much sense to have so many banks in this country, and so there will be certain ones going after scale. But there are a lot of silly mergers too.

At the end of the day, is the shareholder better off after a merger?

BUFFETT: In most acquisitions, it's better to be the target than the acquirer. The acquirer pays for the fact that he gets to haul back to his cave the carcass of the conquered animal.

I am suspicious of people who just keep acquiring almost by the week, though. If you look at the outstanding companies--say, a Microsoft or an Intel or a Wal-Mart--their growth overwhelmingly has been internal. Frequently, if some company is on a real acquisition binge, they feel they're using funny money, and it has certain aspects of a chain-letter game.

Beyond that, I'd like to see a period where merged companies just run by themselves after a deal, rather than moving around the accounting and putting up big restructuring charges. I get suspicious when there's too much activity. I like to see organic growth.

6. Aw, Shucks! Warren and Bill muse on their mistakes, their business partners, and managerial succession.

What was the best business decision you made?

BUFFETT: It was just jumping in the pool, basically. The nice thing about the investment business is that you don't need very many deals to succeed. In fact, if when you got out of business school here, you got a punch card with 20 punches on it, and every time you made an investment decision you used up one punch, and that's all you were going to get, you would make 20 very good investment decisions. And you could get very rich, incidentally. You don't need 50 good ideas at all.

I hope the one I made yesterday was a good one. But they've always been kind of simple and obvious to me. The truth is, you know them when you see them. They're so cheap. When I got out of Columbia University, I went through the Moody's manuals page by page--the industrial manual, the transportation manual, the banks and finance manual--just looking for things. And I found stocks at one times earnings. One was Genessee Valley Gas, a little tiny company up in upstate New York, a public utility selling at one times earnings. There were no brokerage reports on it, no nothing, but all you had to do was turn the page. It worked out so well I actually went through the book a second time. Bill was reading the World Book at that time. He's since put it out of business.

GATES: We were talking at breakfast this morning about which of all Warren's investment decisions was the worst one. They're tough to find because his track record is unbelievable. But we decided that, by some metric, buying the one that his company is named after--Berkshire Hathaway--was probably his worst investment decision.

BUFFETT: That's true. We went into a terrible business because it was cheap. It's what I refer to as the "used cigar butt" approach to investing. You see this cigar butt down there, it's soggy and terrible, but there's one puff left, and it's free. That's what Berkshire was when we bought it--it was selling below working capital--but it was a terrible, terrible mistake.

I've made all kinds of bad decisions that have cost us billions of dollars. They've been mistakes of omission rather than commission. I don't worry about not buying Microsoft, though, because I didn't understand that business. And I didn't understand Intel. But there are businesses that I did understand--Fannie Mae was one that was within my circle of competence. I made a decision to buy it, and I just didn't execute. We would've made many billions of dollars. But we didn't do it. Conventional accounting doesn't record that, but believe me, it happened.

GATES: In my case, I'd have to say my best business decisions have had to do with picking people. Deciding to go into business with Paul Allen is probably at the top of the list, and subsequently, hiring a friend--Steve Ballmer--who has been my primary business partner ever since. It's important to have someone who you totally trust, who is totally committed, who shares your vision, and yet who has a little bit different set of skills and who also acts as something of a check on you. Some of the ideas you run by him, you know he's going to say, "Hey, wait a minute, have you thought about this and that?" The benefit of sparking off somebody who's got that kind of brilliance is that it not only makes business more fun, but it really leads to a lot of success.

BUFFETT: I've had a partner like that--Charlie Munger--for a lot of years, and it does for me exactly what Bill is talking about. You have to calibrate with Charlie, though, because Charlie says everything I do is dumb. If he says it's really dumb, I know it is, but if he just says it's dumb, I take that as an affirmative vote.

It seems that in both of your companies, your success is driven by yourselves and your leadership skills. What will happen when you're gone?

BUFFETT: Your assumption is wrong. I will keep working until about five years after I die, and I've given the directors a Ouija board so they can keep in touch. But if the Ouija board doesn't work, we have outstanding people who can do what I do. People are not going to stop drinking Coca-Cola if I die tonight, they're not going to quit shaving tonight, they're not going to eat less See's candy, or fewer Dilly Bars, or anything of the sort. Those companies have terrific products, they've got outstanding managers, and all you'll need at the top of Berkshire is someone who can allocate capital and make sure you have the right managers down below. We've got the people identified to do that, and the board of directors of Berkshire knows who they are.

In fact, I've already sent out a letter that tells what should be done, and I've got another letter that's addressed that will go out at the time, and it starts out, "Yesterday I died," and then tells what the plans of the company are.

GATES: My attitude is a lot like Warren's. I want to keep doing what I'm doing for a long, long time. I think probably a decade from now or so, even though I'll still be totally involved with Microsoft because it's my career, I will pick somebody else to be CEO.

BUFFETT: I see some hands in the audience here.

GATES: That's a long time hence, and our top managers are always sitting down and talking about succession in general, because we want to make sure that we're giving people the opportunity to move up. We don't want to ever create a situation where they feel like it's clogged and they have to go off

somewhere else to get big challenges. Our growth helps a lot. We're able to spawn off very, very big jobs for people. Picking that next person is something I give a lot of thought to, but it's probably five years before I have to do something very concrete about it. If there was a surprise, well, there's a contingency plan.

7. Charity Begins When I'm Ready Bill and Warren explain why they'll give away 99% of their wealth... someday.

As two of the world's most successful business people, what role do you see for yourselves in giving back to your communities? And how do you use your influence to get others to give back as well?

BUFFETT: We both have a similar philosophy on that. I know in my own case that 99%-plus will go back to society, just because we've been treated extraordinarily well by society.

I'm lucky. I don't run very fast, but I'm wired in a particular way that I thrive in a big capitalist economy with a lot of action. I'm not adapted for football, I'm not adapted for violin playing. I happen to be in something that pays off huge in this society. As Bill says, if I had been born some time ago I would've been some animal's lunch.

I do not believe in the divine right of the womb. Frankly, I don't think it's right that the quarterback of the Nebraska football team next year should be the eldest son of the quarterback of the Nebraska football team of 22 years ago. Nor do I think that our Olympic team in 2000 should be chosen from the same family that was on the Olympic team in the various respective sports in 1976.

We believe in a meritocracy when it comes to athletics and all sorts of things. Now, why not have a meritocracy in terms of what you go out into the world with in terms of the productive goods? Let the resources flow to those who use them best, and then I believe they should give them back to society when they get through.

GATES: That's a great philosophy, not to mention that passing along a lot of money can be bad for the people who receive it.

BUFFETT: You'd better not put it to a vote.

How do you use your role as successful businessmen in influencing others, even those who are not as successful, to give back?

BUFFETT: Let me suggest another way to think about this. Let's say that it was 24 hours before you were born, and a genie appeared and said, "You look like a winner. I have enormous confidence in you, and what I'm going to do is let you set the rules of the society into which you will be born. You can set the economic rules and the social rules, and whatever rules you set will apply during your lifetime and your children's lifetimes."

And you'll say, "Well, that's nice, but what's the catch?"

And the genie says, "Here's the catch. You don't know if you're going to be born rich or poor, white or black, male or female, able-bodied or infirm, intelligent or retarded." So all you know is that you're going to get one ball out of a barrel with, say, 5.8 billion balls in it. You're going to participate in what I call the ovarian lottery. It's the most important thing that will happen to you in your life, but you have no control over it. It's going to determine far more than your grades at school or anything else that happens to you.

Now, what rules do you want to have? I'm not going to tell you the rules, and nobody will tell you; you have to make them up for yourself. But they will affect how you think about what you do in your will and things of that sort. That's because you're going to want to have a system that turns out more and more goods and services. You've got a great quantity of people out there, and you want them to live pretty well, and you want your kids to live better than you did, and you want your grandchildren to live better than your kids. You're going to want a system that keeps Bill Gates and Andy Grove and Jack Welch working long, long after they don't need to work. You're going to want the most able people working more than 12 hours a day. So you've got to have a system that gives them an incentive to turn out the goods and services.

But you're also going to want a system that takes care of the bad balls, the ones that aren't lucky. If you have a system that is turning out enough goods and services, you can take care of them. You don't want people worrying about being sick in their old age, or fearful about going home at night. You want a system where people are free of fear to some extent.

So you'll try to design something, assuming you have the goods and services to solve that sort of thing. You'll want equality of opportunity--namely a good public school system--to make you feel that every piece of talent out there will get the same shot at contributing. And your tax system will follow from your reasoning on that. And what you do with the money you make is another thing to think about. As you work through that, everybody comes up with something a little different. I just suggest you play that little game.

How do you see yourselves as leaders in facets of human experience other than business?

GATES: You have to be careful, if you're good at something, to make sure you don't think you're good at other things that you aren't necessarily so good at. I come in every day and work with a great team of people who are trying to figure out how to make great software, listening to the feedback and doing the research. And it's very typical that because I've been very successful at that, people come in and expect that I have wisdom about topics that I don't.

I do think there are some ways that we've run the company--the way we've hired people, and created an environment and used stock options--that would be good lessons for other businesses as well. But I always want to be careful not to suggest that we've found the solutions to all problems.

BUFFETT: You can learn a lot by studying Microsoft and Bill. And you can learn the most by studying what it is he does year after year. But if he devoted 5% or 10% to what he's now doing, and then spread the remainder of his attention over a bunch of other things, well, society would be worse off, in my view.

Bill's right, occasionally there are things--like campaign finance reform--that he may want to take a position on. But you still don't want to say that the whole world ought to follow you on it. I'm very suspect of the person who is very good at one business--it also could be a good athlete or a good entertainer--who starts thinking they should tell the world how to behave on everything. For us to think that just because we made a lot of money, we're going to be better at giving advice on every subject--well, that's just crazy.

Having fielded their last question, the two billionaires briefly acknowledged the applause and bolted off the stage, leaving behind an audience that clearly would have relished another two hours of them. But no. Practically before the applause had died down, the two had jumped into Gates' Lexus and sped off. After all, they had a bridge game to play.

Mr. Buffett on the Stock Market

11/22/1999

The most celebrated of investors says stocks can't possibly meet the public's expectations. As for the Internet? He notes how few people got rich from two other transforming industries, auto and aviation.

Warren Buffett, chairman of Berkshire Hathaway, almost never talks publicly about the general level of stock prices--neither in his famed annual report nor at Berkshire's thronged annual meetings nor in the rare speeches he gives. But in the past few months, on four occasions, Buffett did step up to that subject, laying out his opinions, in ways both analytical and creative, about the long-term future for stocks. FORTUNE's Carol Loomis heard the last of those talks, given in September to a group of Buffett's friends (of whom she is one), and also watched a videotape of the first speech, given in July at Allen & Co.'s Sun Valley, Idaho, bash for business leaders. From those extemporaneous talks (the first made with the Dow Jones industrial average at 11,194), Loomis distilled the following account of what Buffett said. Buffett reviewed it and weighed in with some clarifications.

Investors in stocks these days are expecting far too much, and I'm going to explain why. That will inevitably set me to talking about the general stock market, a subject I'm usually unwilling to discuss. But I want to make one thing clear going in: Though I will be talking about the level of the market, I will not be predicting its next moves. At Berkshire we focus almost exclusively on the valuations of individual companies, looking only to a very limited extent at the valuation of the overall market. Even then, valuing the market has nothing to do with where it's going to go next week or next month or next year, a line of thought we never get into. The fact is that markets behave in ways, sometimes for a very long stretch, that are not linked to value. Sooner or later, though, value counts. So what I am going to be saying--assuming it's correct--will have implications for the long-term results to be realized by American stockholders.

Let's start by defining "investing." The definition is simple but often forgotten: Investing is laying out money now to get more money back in the future--more money in real terms, after taking inflation into account.

Now, to get some historical perspective, let's look back at the 34 years before this one--and here we are going to see an almost Biblical kind of symmetry, in the sense of lean years and fat years--to observe what happened in the stock market. Take, to begin with, the first 17 years of the period, from the end of 1964 through 1981. Here's what took place in that interval:

Dow Jones Industrial Average

Dec. 31, 1964: 874.12

Dec. 31, 1981: 875.00

Now I'm known as a long-term investor and a patient guy, but that is not my idea of a big move.

And here's a major and very opposite fact: During that same 17 years, the GDP of the U.S.--that is, the business being done in this country--almost quintupled, rising by 370%. Or, if we look at another measure, the sales of the FORTUNE 500 (a changing mix of companies, of course) more than sextupled. And yet the Dow went exactly nowhere.

To understand why that happened, we need first to look at one of the two important variables that affect investment results: interest rates. These act on financial valuations the way gravity acts on matter: The higher the rate, the greater the downward pull. That's because the rates of return that investors need from any kind of investment are directly tied to the risk-free rate that they can earn from government securities.

So if the government rate rises, the prices of all other investments must adjust downward, to a level that brings their expected rates of return into line. Conversely, if government interest rates fall, the move pushes the prices of all other investments upward. The basic proposition is this: What an investor should pay today for a dollar to be received tomorrow can only be determined by first looking at the risk-free interest rate.

Consequently, every time the risk-free rate moves by one basis point--by 0.01%--the value of every investment in the country changes. People can see this easily in the case of bonds, whose value is normally affected only by interest rates. In the case of equities or real estate or farms or whatever, other very important variables are almost always at work, and that means the effect of interest rate changes is usually obscured. Nonetheless, the effect--like the invisible pull of gravity--is constantly there.

In the 1964-81 period, there was a tremendous increase in the rates on long-term government bonds, which moved from just over 4% at year-end 1964 to more than 15% by late 1981. That rise in rates had a huge depressing effect on the value of all investments, but the one we noticed, of course, was the price of equities. So there--in that tripling of the gravitational pull of interest rates--lies the major explanation of why tremendous growth in the economy was accompanied by a stock market going nowhere.

Then, in the early 1980s, the situation reversed itself. You will remember Paul Volcker coming in as chairman of the Fed and remember also how unpopular he was. But the heroic things he did--his taking a two-by-four to the economy and breaking the back of inflation--caused the interest rate trend to reverse, with some rather spectacular results. Let's say you put \$1 million into the 14% 30-year U.S. bond issued Nov. 16, 1981, and reinvested the coupons. That is, every time you got an interest payment, you used it to buy more of that same bond. At the end of 1998, with long-term governments by then selling at 5%, you would have had \$8,181,219 and would have earned an annual return of more than 13%.

That 13% annual return is better than stocks have done in a great many 17-year periods in history--in most 17-year periods, in fact. It was a helluva result, and from none other than a stodgy bond.

The power of interest rates had the effect of pushing up equities as well, though other things that we will get to pushed additionally. And so here's what equities did in that same 17 years: If you'd invested \$1 million in the Dow on Nov. 16, 1981, and reinvested all dividends, you'd have had \$19,720,112 on Dec. 31, 1998. And your annual return would have been 19%.

The increase in equity values since 1981 beats anything you can find in history. This increase even surpasses what you would have realized if you'd bought stocks in 1932, at their Depression bottom--on its lowest day, July 8, 1932, the Dow closed at 41.22--and held them for 17 years.

The second thing bearing on stock prices during this 17 years was after-tax corporate profits, which the chart, After-Tax Corporate Profits as a Percentage of GDP, displays as a percentage of GDP. In effect, what this chart tells you is what portion of the GDP ended up every year with the shareholders of American business.

The chart, as you will see, starts in 1929. I'm quite fond of 1929, since that's when it all began for me. My dad was a stock salesman at the time, and after the Crash came, in the fall, he was afraid to call anyone--all those people who'd been burned. So he just stayed home in the afternoons. And there wasn't television then. Soooo... I was conceived on or about Nov. 30, 1929 (and born nine months later, on Aug. 30, 1930), and I've forever had a kind of warm feeling about the Crash.

As you can see, corporate profits as a percentage of GDP peaked in 1929, and then they tanked. The left-hand side of the chart, in fact, is filled with aberrations: not only the Depression but also a wartime profits

boom--sedated by the excess-profits tax--and another boom after the war. But from 1951 on, the percentage settled down pretty much to a 4% to 6.5% range.

By 1981, though, the trend was headed toward the bottom of that band, and in 1982 profits tumbled to 3.5%. So at that point investors were looking at two strong negatives: Profits were sub-par and interest rates were sky-high.

And as is so typical, investors projected out into the future what they were seeing. That's their unshakable habit: looking into the rear-view mirror instead of through the windshield. What they were observing, looking backward, made them very discouraged about the country. They were projecting high interest rates, they were projecting low profits, and they were therefore valuing the Dow at a level that was the same as 17 years earlier, even though GDP had nearly quintupled.

Now, what happened in the 17 years beginning with 1982? One thing that didn't happen was comparable growth in GDP: In this second 17-year period, GDP less than tripled. But interest rates began their descent, and after the Volcker effect wore off, profits began to climb--not steadily, but nonetheless with real power. You can see the profit trend in the chart, which shows that by the late 1990s, after-tax profits as a percent of GDP were running close to 6%, which is on the upper part of the "normalcy" band. And at the end of 1998, long-term government interest rates had made their way down to that 5%.

These dramatic changes in the two fundamentals that matter most to investors explain much, though not all, of the more than tenfold rise in equity prices--the Dow went from 875 to 9,181--during this 17-year period. What was at work also, of course, was market psychology. Once a bull market gets under way, and once you reach the point where everybody has made money no matter what system he or she followed, a crowd is attracted into the game that is responding not to interest rates and profits but simply to the fact that it seems a mistake to be out of stocks. In effect, these people superimpose an I-can't-miss-the-party factor on top of the fundamental factors that drive the market. Like Pavlov's dog, these "investors" learn that when the bell rings--in this case, the one that opens the New York Stock Exchange at 9:30 a.m.--they get fed. Through this daily reinforcement, they become convinced that there is a God and that He wants them to get rich.

Today, staring fixedly back at the road they just traveled, most investors have rosy expectations. A Paine Webber and Gallup Organization survey released in July shows that the least experienced investors--those who have invested for less than five years--expect annual returns over the next ten years of 22.6%. Even those who have invested for more than 20 years are expecting 12.9%.

Now, I'd like to argue that we can't come even remotely close to that 12.9%, and make my case by examining the key value-determining factors. Today, if an investor is to achieve juicy profits in the market over ten years or 17 or 20, one or more of three things must happen. I'll delay talking about the last of them for a bit, but here are the first two:

(1) Interest rates must fall further. If government interest rates, now at a level of about 6%, were to fall to 3%, that factor alone would come close to doubling the value of common stocks. Incidentally, if you think interest rates are going to do that--or fall to the 1% that Japan has experienced--you should head for where you can really make a bundle: bond options.

(2) Corporate profitability in relation to GDP must rise. You know, someone once told me that New York has more lawyers than people. I think that's the same fellow who thinks profits will become larger than GDP. When you begin to expect the growth of a component factor to forever outpace that of the aggregate, you get into certain mathematical problems. In my opinion, you have to be wildly optimistic to

believe that corporate profits as a percent of GDP can, for any sustained period, hold much above 6%. One thing keeping the percentage down will be competition, which is alive and well. In addition, there's a public-policy point: If corporate investors, in aggregate, are going to eat an ever-growing portion of the American economic pie, some other group will have to settle for a smaller portion. That would justifiably raise political problems--and in my view a major reslicing of the pie just isn't going to happen. \

So where do some reasonable assumptions lead us? Let's say that GDP grows at an average 5% a year--3% real growth, which is pretty darn good, plus 2% inflation. If GDP grows at 5%, and you don't have some help from interest rates, the aggregate value of equities is not going to grow a whole lot more. Yes, you can add on a bit of return from dividends. But with stocks selling where they are today, the importance of dividends to total return is way down from what it used to be. Nor can investors expect to score because companies are busy boosting their per share earnings by buying in their stock. The offset here is that the companies are just about as busy issuing new stock, both through primary offerings and those ever present stock options.

So I come back to my postulation of 5% growth in GDP and remind you that it is a limiting factor in the returns you're going to get: You cannot expect to forever realize a 12% annual increase--much less 22%--in the valuation of American business if its profitability is growing only at 5%. The inescapable fact is that the value of an asset, whatever its character, cannot over the long term grow faster than its earnings do.

Now, maybe you'd like to argue a different case. Fair enough. But give me your assumptions. If you think the American public is going to make 12% a year in stocks, I think you have to say, for example, "Well, that's because I expect GDP to grow at 10% a year, dividends to add two percentage points to returns, and interest rates to stay at a constant level." Or you've got to rearrange these key variables in some other manner. The Tinker Bell approach-- clap if you believe--just won't cut it.

Beyond that, you need to remember that future returns are always affected by current valuations and give some thought to what you're getting for your money in the stock market right now. Here are two 1998 figures for the FORTUNE 500. The companies in this universe account for about 75% of the value of all publicly owned American businesses, so when you look at the 500, you're really talking about America Inc.

FORTUNE 500

1998 profits: \$334,335,000,000

Market value on March 15, 1999: \$9,907,233,000,000

As we focus on those two numbers, we need to be aware that the profits figure has its quirks. Profits in 1998 included one very unusual item--a \$16 billion bookkeeping gain that Ford reported from its spinoff of Associates-- and profits also included, as they always do in the 500, the earnings of a few mutual companies, such as State Farm, that do not have a market value. Additionally, one major corporate expense, stock-option compensation costs, is not deducted from profits. On the other hand, the profits figure has been reduced in some cases by write-offs that probably didn't reflect economic reality and could just as well be added back in. But leaving aside these qualifications, investors were saying on March 15 this year that they would pay a hefty \$10 trillion for the \$334 billion in profits.

Bear in mind--this is a critical fact often ignored--that investors as a whole cannot get anything out of their businesses except what the businesses earn. Sure, you and I can sell each other stocks at higher and higher prices. Let's say the FORTUNE 500 was just one business and that the people in this room each owned a piece of it. In that case, we could sit here and sell each other pieces at ever-ascending prices.

You personally might outsmart the next fellow by buying low and selling high. But no money would leave the game when that happened: You'd simply take out what he put in. Meanwhile, the experience of the group wouldn't have been affected a whit, because its fate would still be tied to profits. The absolute most that the owners of a business, in aggregate, can get out of it in the end--between now and Judgment Day--is what that business earns over time.

And there's still another major qualification to be considered. If you and I were trading pieces of our business in this room, we could escape transactional costs because there would be no brokers around to take a bite out of every trade we made. But in the real world investors have a habit of wanting to change chairs, or of at least getting advice as to whether they should, and that costs money--big money. The expenses they bear--I call them frictional costs--are for a wide range of items. There's the market maker's spread, and commissions, and sales loads, and 12b-1 fees, and management fees, and custodial fees, and wrap fees, and even subscriptions to financial publications. And don't brush these expenses off as irrelevancies. If you were evaluating a piece of investment real estate, would you not deduct management costs in figuring your return? Yes, of course--and in exactly the same way, stock market investors who are figuring their returns must face up to the frictional costs they bear.

And what do they come to? My estimate is that investors in American stocks pay out well over \$100 billion a year-- say, \$130 billion--to move around on those chairs or to buy advice as to whether they should! Perhaps \$100 billion of that relates to the FORTUNE 500. In other words, investors are dissipating almost a third of everything that the FORTUNE 500 is earning for them--that \$334 billion in 1998--by handing it over to various types of chair-changing and chair-advisory "helpers." And when that handoff is completed, the investors who own the 500 are reaping less than a \$250 billion return on their \$10 trillion investment. In my view, that's slim pickings.

Perhaps by now you're mentally quarreling with my estimate that \$100 billion flows to those "helpers." How do they charge thee? Let me count the ways. Start with transaction costs, including commissions, the market maker's take, and the spread on underwritten offerings: With double counting stripped out, there will this year be at least 350 billion shares of stock traded in the U.S., and I would estimate that the transaction cost per share for each side--that is, for both the buyer and the seller--will average 6 cents. That adds up to \$42 billion.

Move on to the additional costs: hefty charges for little guys who have wrap accounts; management fees for big guys; and, looming very large, a raft of expenses for the holders of domestic equity mutual funds. These funds now have assets of about \$3.5 trillion, and you have to conclude that the annual cost of these to their investors--counting management fees, sales loads, 12b-1 fees, general operating costs--runs to at least 1%, or \$35 billion.

And none of the damage I've so far described counts the commissions and spreads on options and futures, or the costs borne by holders of variable annuities, or the myriad other charges that the "helpers" manage to think up. In short, \$100 billion of frictional costs for the owners of the FORTUNE 500--which is 1% of the 500's market value-- looks to me not only highly defensible as an estimate, but quite possibly on the low side.

It also looks like a horrendous cost. I heard once about a cartoon in which a news commentator says, "There was no trading on the New York Stock Exchange today. Everyone was happy with what they owned." Well, if that were really the case, investors would every year keep around \$130 billion in their pockets.

Let me summarize what I've been saying about the stock market: I think it's very hard to come up with a persuasive case that equities will over the next 17 years perform anything like--anything like--they've performed in the past 17. If I had to pick the most probable return, from appreciation and dividends combined, that investors in aggregate-- repeat, aggregate--would earn in a world of constant interest rates, 2% inflation, and those ever hurtful frictional costs, it would be 6%. If you strip out the inflation component from this nominal return (which you would need to do however inflation fluctuates), that's 4% in real terms. And if 4% is wrong, I believe that the percentage is just as likely to be less as more.

Let me come back to what I said earlier: that there are three things that might allow investors to realize significant profits in the market going forward. The first was that interest rates might fall, and the second was that corporate profits as a percent of GDP might rise dramatically. I get to the third point now: Perhaps you are an optimist who believes that though investors as a whole may slog along, you yourself will be a winner. That thought might be particularly seductive in these early days of the information revolution (which I wholeheartedly believe in). Just pick the obvious winners, your broker will tell you, and ride the wave.

Well, I thought it would be instructive to go back and look at a couple of industries that transformed this country much earlier in this century: automobiles and aviation. Take automobiles first: I have here one page, out of 70 in total, of car and truck manufacturers that have operated in this country. At one time, there was a Berkshire car and an Omaha car. Naturally I noticed those. But there was also a telephone book of others.

All told, there appear to have been at least 2,000 car makes, in an industry that had an incredible impact on people's lives. If you had foreseen in the early days of cars how this industry would develop, you would have said, "Here is the road to riches." So what did we progress to by the 1990s? After corporate carnage that never let up, we came down to three U.S. car companies--themselves no lollapaloozas for investors. So here is an industry that had an enormous impact on America--and also an enormous impact, though not the anticipated one, on investors.

Sometimes, incidentally, it's much easier in these transforming events to figure out the losers. You could have grasped the importance of the auto when it came along but still found it hard to pick companies that would make you money. But there was one obvious decision you could have made back then--it's better sometimes to turn these things upside down--and that was to short horses. Frankly, I'm disappointed that the Buffett family was not short horses through this entire period. And we really had no excuse: Living in Nebraska, we would have found it super easy to borrow horses and avoid a "short squeeze."

U.S. Horse Population

1900: 21 million

1998: 5 million

The other truly transforming business invention of the first quarter of the century, besides the car, was the airplane-- another industry whose plainly brilliant future would have caused investors to salivate. So I went back to check out aircraft manufacturers and found that in the 1919-39 period, there were about 300 companies, only a handful still breathing today. Among the planes made then--we must have been the Silicon Valley of that age--were both the Nebraska and the Omaha, two aircraft that even the most loyal Nebraskan no longer relies upon.

Move on to failures of airlines. Here's a list of 129 airlines that in the past 20 years filed for bankruptcy. Continental was smart enough to make that list twice. As of 1992, in fact--though the picture would have

improved since then-- the money that had been made since the dawn of aviation by all of this country's airline companies was zero. Absolutely zero.

Sizing all this up, I like to think that if I'd been at Kitty Hawk in 1903 when Orville Wright took off, I would have been farsighted enough, and public-spirited enough--I owed this to future capitalists--to shoot him down. I mean, Karl Marx couldn't have done as much damage to capitalists as Orville did.

I won't dwell on other glamorous businesses that dramatically changed our lives but concurrently failed to deliver rewards to U.S. investors: the manufacture of radios and televisions, for example. But I will draw a lesson from these businesses: The key to investing is not assessing how much an industry is going to affect society, or how much it will grow, but rather determining the competitive advantage of any given company and, above all, the durability of that advantage. The products or services that have wide, sustainable moats around them are the ones that deliver rewards to investors.

This talk of 17-year periods makes me think--incongruously, I admit--of 17-year locusts. What could a current brood of these critters, scheduled to take flight in 2016, expect to encounter? I see them entering a world in which the public is less euphoric about stocks than it is now. Naturally, investors will be feeling disappointment--but only because they started out expecting too much.

Grumpy or not, they will have by then grown considerably wealthier, simply because the American business establishment that they own will have been chugging along, increasing its profits by 3% annually in real terms. Best of all, the rewards from this creation of wealth will have flowed through to Americans in general, who will be enjoying a far higher standard of living than they do today. That wouldn't be a bad world at all--even if it doesn't measure up to what investors got used to in the 17 years just passed.

Bezos on Buffett

Skeptical of Internet mania, the founder and CEO of Amazon.com is spreading the gospel according to Buffett.

Patricia Sellers

Warren Buffett doesn't mention the Internet on these pages. But he does talk about two other transforming industries that failed to reward investors over time: autos and aviation. Only a fool would ignore his implicit warning: A lot of people will lose a lot of money betting on the Internet. Amazon.com founder and CEO Jeff Bezos was so intrigued by Buffett's talk at Herb Allen's gathering of business leaders in Sun Valley, Idaho, last July that he asked Buffett for his lists of the automakers and aircraft manufacturers that didn't make it. "When new industries become phenomenons, a lot of investors bet on the wrong companies," Bezos says. Referring to Buffett's 70-page catalog of mostly dead car and truck makes, he adds, "I noticed that decades ago, it was de rigueur to use 'Motors' in the name, just as everybody uses 'dot-com' today. I thought, Wow, the parallel is interesting."

Especially interesting to a billionaire like Bezos, who knows something about stock valuations from his previous career as a hedge fund manager. Interesting also to Bezos the history buff, who likes to talk about the Cambrian explosion about 550 million years ago, when multicelled life spawned unprecedented variation of species--and with it, a wave of extinctions. Given this perspective, Bezos says, Buffett's analogies about bankrupt businesses "resonate deeply." Now Bezos is spreading the gospel according to

Buffett and urging Amazon employees to run scared every day. “We still have the opportunity to be a footnote in the e-commerce industry,” he says.

What I learned in Business School

Mar/April 2001

Let's say that when you left college they gave you a little bonus: You got to pick out anybody in your class, and you'd get 10 percent of his or her future earnings. All of a sudden, you look at the whole group in a different way. You've seen them in class; you know their grades and their leadership capabilities. Taking these factors into account, you ask yourself, "Whom do I pick?" But how good a choice do you think you could make? It would be a lot easier if you could make that decision at your 10th class reunion, after you've seen their actual business performance, wouldn't it?

These are the judgments that Berkshire Hathaway makes about management all the time. We try to find businesses that we really feel good about owning. What a company's stock sells for today, tomorrow, next week, or next year doesn't matter. What counts is how the company does over a five- or 10-year period. It has nothing to do with charts or numbers. It has to do with businesses and management.

Another thing I learned in business school was that it doesn't help to be smarter than even your dumbest competitor. The trick is to have no competitors. That means having a product that truly differentiates itself.

Say a customer goes into a drugstore and asks for a Hershey bar. The clerk says, "We don't have any, but why don't you take this other chocolate bar instead; it's a nickel cheaper." And the customer says, "I'll go across the street." It's when the customer will go across the street that you've got a great business.

Warren Buffett on the Stock Market

12/10/2001

What's in the future for investors — another roaring bull market or more upset stomach? Amazingly, the answer may come down to three simple factors. Here, the world's most celebrated investor talks about what really makes the market tick — and whether that ticking should make you nervous.

TWO YEARS AGO, FOLLOWING A JULY 1999 SPEECH BY Warren Buffett, chairman of Berkshire Hathaway, on the stock market — a rare subject for him to discuss publicly — FORTUNE ran what he had to say under the title "Mr. Buffett on the Stock Market" (Nov. 22, 1999). His main points then concerned two consecutive and amazing periods that American investors had experienced, and his belief that returns from stocks were due to fall dramatically. Since the Dow Jones Industrial Average was 11194 when he gave his speech and recently was about 9900, no one yet has the goods to argue with him.

So where do we stand now — with the stock market seeming to reflect a dismal profit outlook, an unfamiliar war, and rattled consumer confidence? Who better to supply perspective on that question than Buffett?

The thoughts that follow come from a second Buffett speech, given last July at the site of the first talk. Allen & Co.'s annual Sun Valley bash for corporate executives. There, the renowned stockpicker returned to the themes he'd discussed before, bringing new data and insights to the subject. Working with FORTUNE'S Carol Loomis, Buffett distilled that speech into this essay, a fitting opening for this year's Investor's Guide. Here again is Mr. Buffett on the Stock Market.

The last time I tackled this subject, in 1999, I broke down the previous 34 years into two 17-year periods, which in the sense of lean years and fat were astonishingly symmetrical. Here's the first period. As you can see, over 17 years the Dow gained exactly one-tenth of one percent.

• DOW JONES INDUSTRIAL AVERAGE

Dec. 31, 1964:874.12

Dec. 31, 1981:875.00

And here's the second, marked by an incredible bull market that, as I laid out my thoughts, was about to end (though I didn't know that).

• DOW INDUSTRIALS

Dec. 31, 1981: 875.00

Dec. 31, 1998: 9181.43

Now, you couldn't explain this remarkable divergence in markets by, say, differences in the growth of gross national product. In the first period — that dismal time for the market — GNP actually grew more than twice as fast as it did in the second period.

• GAIN IN GROSS NATIONAL PRODUCT

- 1964-1981:373%
- 1981-1988:177%

[More Compilations](#)

So what was the explanation? I concluded that the market's contrasting moves were caused by extraordinary changes in two critical economic variables — and by a related psychological force that eventually came into play.

Here I need to remind you about the definition of "investing," which though simple is often forgotten. Investing is laying out money today to receive more money tomorrow.

That gets to the first of the economic variables that affected stock prices in the two periods — interest rates. In economics, interest rates act as gravity behaves in the physical world. At all times, in all markets, in all parts of the world, the tiniest change in rates changes the value of every financial asset. You see that clearly with the fluctuating prices of bonds. But the rule applies as well to farmland, oil reserves, stocks, and every other financial asset. And the effects can be huge on values. If interest rates are, say, 13%, the present value of a dollar that you're going to receive in the future from an investment is not nearly as high as the present value of a dollar if rates are 4%.

So here's the record on interest rates at key dates in our 34-year span. They moved dramatically up — that was bad for investors — in the first half of that period and dramatically down—a boon for investors — in the second half.

• INTEREST RATES, LONG-TERM GOVERNMENT BONDS

Dec. 31, 1964: 4.20%

Dec. 31, 1981: 13.65%

Dec. 31, 1998: 5.09%

The other critical variable here is how many dollars investors expected to get from the companies in which they invested. During the first period expectations fell significantly because corporate profits weren't looking good. By the early 1980s Fed Chairman Paul Volcker's economic sledgehammer had, in fact, driven corporate profitability to a level that people hadn't seen since the 1930s.

The upshot is that investors lost their confidence in the American economy: They were looking at a future they believed would be plagued by two negatives. First, they didn't see much good coming in the way of corporate profits. Second, the sky-high interest rates prevailing caused them to discount those meager profits further. These two factors, working together, caused stagnation in the stock market from 1964 to 1981, even though those years featured huge improvements in GNP. The business of the country grew while investors' valuation of that business shrank!

And then the reversal of those factors created a period during which much lower GNP gains were accompanied by a bonanza for the market. First, you got a major increase in the rate of profitability. Second, you got an enormous drop in interest rates, which made a dollar of future profit that much more valuable. Both phenomena were real and powerful fuels for a major bull market. And in time the psychological factor I mentioned was added to the equation: Speculative trading exploded, simply because of the market action that people had seen. Later, we'll look at the pathology of this dangerous and oft-recurring malady.

Two years ago I believed the favorable fundamental trends had largely run their course. For the market to go dramatically up from where it was then would have required long-term interest rates to drop much further (which is always possible) or for there to be a major improvement in corporate profitability (which seemed, at the time, considerably less possible). If you take a look at a 50-year chart of after-tax profits as a percent of gross domestic product, you find that the rate normally falls between 4% — that was its

neighborhood in the bad year of 1981, for example — and 6.5%. For the rate to go above 6.5% is rate. In the very good profit years of 1999 and 2000 the rate was under 6% and this year it may well fall below 5%.

So there you have my explanation of those two wildly different 17-year periods. The question is, How much do those periods of the past for the market say about its future?

To suggest in answer, I'd like to look back over the 20th century. As you know, this was really the American century. We had the advent of autos, we had aircraft, we had radio, TV, and computers. It was an incredible period. Indeed, the per capita growth in U.S. output, measured in real dollars (that is, with no impact from inflation), was a breathtaking 702%.

The century included some very tough years, of course—like the Depression years of 1929 to 1933. But a decade- y-decade look at per capita GNP shows something remarkable: As a nation, we made relatively consistent progress throughout the century. So you might think that the economic value of the U.S.—at least as measured by its securities markets — would have grown at a reasonably consistent pace as well.

That's not what happened. We know from our earlier examination of the 1964 — 98 period that parallelism broke down completely in that era. But the whole century makes this point as well. At its beginning, for example between 1900 and 1920, the country was chugging ahead, explosively expanding its use of electricity, autos, and the telephone. Yet the market barely moved, recording a 0.4% annual increase that was roughly analogous to the slim picking between 1964 and 1981.

• DOW INDUSTRIALS

Dec. 31, 1899: 66 08

Dec. 31, 1920: 71 95

In the next period, we had the market boom of the '20s when the Dow jumped 4.30% to 381 in September 1929. Then we go 19 years — 19 years — and there is the Dow at 177, half the level where it began. That's true even though the 1940s displayed by far the largest gain in per capita GDP (50%) of any 20th-century decade. Following that came a 17-year period when stocks finally took after making a great five-to-one gain. And then the two periods discussed when to start stagnation until 1981, and the roaring boom that swapped up his amazing century.

To break things down another way, we had three huge, secular bull markets that covered about 44 years, during which the Dow gained more than 11,000 points. And we had three periods of stag-station covering some 56 years. During those 56 years the country made major economic progress and yet the Dow actually lost 292 points.

How could this have happened? In a flourishing country in which people are focused on making money, how could you have had three extended and anguishing periods of stagnation that in aggregate — leaving aside dividends — would have lost you money? The answer lies in the mistake that investors repeatedly make — that psychological force I mentioned above: People are habitually guided by the rear-view mirror and, for the most part, by the vistas immediately behind them.

The first part of the century offers a vivid illustration of that myopia. In the century's first 20 years, stocks normally yielded more than high-grade bonds. That relationship now seems quaint, but it was then almost axiomatic. Stocks were known to be riskier, so why buy them unless you were paid a premium?

And then came along a 1924 book — slim and initially unheralded, but destined to move markets as never before — written by a man named Edgar Lawrence Smith. The book, called *Common Stocks as Long Term Investments*, chronicled a study Smith had done of security price movements in the 56 years ended in 1922. Smith had started off his study with a hypothesis: Stocks would do better in times of inflation, and bonds would do better in times of deflation. It was a perfectly reasonable hypothesis.

But consider the first words in the book: "These studies are the record of a failure — the failure of facts to sustain a preconceived theory." Smith went on: "The facts assembled, however, seemed worthy of further examination. If they would not prove what we had hoped to have them prove, it seemed desirable to turn them loose and to follow them to whatever end they might lead."

Now, there was a smart man. who did Just about the hardest thing in the world to do. Charles Darwin used to say that whenever he ran into something that contradicted a conclusion he cherished, he was obliged to write the new finding down within 30 minutes. Otherwise his mind would work to reject the discordant information, much as the body rejects transplants. Man's natural inclination is to cling to his beliefs, particularly if they are reinforced by recent experience—a flaw in our makeup that bears on what happens during secular bull markets and extended periods of stagnation.

To report what Edgar Lawrence Smith discovered, I will quote a legendary thinker — John Maynard Keynes, who in 1925 reviewed the book, thereby putting it on the map. In his review, Keynes described "perhaps Mr. Smith's most important point... and certainly his most novel point. Well-managed industrial companies do not, as a rule, distribute to the shareholders the whole of their earned profits. In good years, if not in all years, they retain a part of their profits and put them back in the business. Thus there is an element of compound interest (Keynes' italics) operating in favor of a sound industrial investment."

It was that simple. It wasn't even news. People certainly knew that companies were not paying out 100% of their earnings. But investors hadn't thought through the implications of the point. Here, though, was this guy Smith saying, "Why do stocks typically outperform bonds? A major reason is that businesses retain earnings, with these going on to generate still more earnings — and dividends, too."

That finding ignited an unprecedented bull market. Galvanized by Smith's insight, investors piled into stocks, anticipating a double dip: their higher initial yield over bonds, and growth to boot. For the American public, this new understanding was like the discovery of fire.

But before long that same public was burned. Stocks were driven to prices that first pushed down their yield to that on bonds and ultimately drove their yield far lower. What happened then should strike readers as eerily familiar: The mere fact that share prices were rising so quickly became the main impetus for people to rush into stocks. What the few bought for the right reason in 1925, the many bought for the wrong reason in 1929.

Astutely, Keynes anticipated a perversity of this kind in his 1925 review. He wrote: "It is dangerous ... to apply to the future inductive arguments based on past experience, unless one can distinguish the broad reasons why past experience was what it was." If you can't do that, he said, you may fall into the trap of expecting results in the future that will materialize only if conditions are exactly the same as they were in the past. The special conditions he had in mind, of course, stemmed from the fact that Smith's study covered a half century during which stocks generally yielded more than high-grade bonds.

The colossal miscalculation that investors made in the 1920s has recurred in one form or another several times since. The public's monumental hangover from its stock binge of the 1920s lasted, as we have seen, through 1948. The country was then intrinsically far more valuable than it had been 20 years before;

dividend yields were more than double the yield on bonds; and yet stock prices were at less than half their 1929 peak. The conditions that had produced Smith's wondrous results had reappeared — in spades.

But rather than seeing what was in plain sight in the late 1940s, investors were transfixed by the frightening market of the early 1930s and were avoiding re-exposure to pain.

Don't think for a moment that small investors are the only ones guilty of too much attention to the rear-view mirror. Let's look at the behavior of professionally managed pension funds in recent decades. In 1971 — this was Nifty Fifty time — pension managers, feeling great about the market, put more than 90% of their net cash flow into stocks, a record commitment at the time. And then, in a couple of years, the roof fell in and stocks got way cheaper. So what did the pension fund managers do? They quit buying because stocks got cheaper!

• PRIVATE PENSION FUNDS

% of cash flow put into equities

- 1971: 91% (record high)
- 1974: 13%

This is the one thing I can never understand. To refer to a personal taste of mine, I'm going to buy hamburgers the rest of my life. When hamburgers go down in price, we sing the "Hallelujah Chorus" in the Buffett household. When hamburgers go up, we weep. For most people, it's the same way with everything in life they will be buying — except stocks. When stocks go down and you can get more for your money, people don't like them anymore.

That sort of behavior is especially puzzling when engaged in by pension fund managers, who by all rights should have the longest time horizon of any investors. These managers are not going to need the money in their funds tomorrow, not next year, nor even next decade. So they have total freedom to sit back and relax. Since they are not operating with their own funds, moreover, raw greed should not distort their decisions. They should simply think about what makes the most sense. Yet they behave just like rank amateurs (getting paid, though, as if they had special expertise).

In 1979, when I felt stocks were a screaming buy, I wrote in an article. "Pension fund managers continue to make investment decisions with their eyes firmly fixed on the rear-view mirror. This generals-fighting-the-last-war approach has proved costly in the past and will likely prove equally costly this time around." That's true, I said, because "stocks now sell at levels that should produce long-term returns far superior to bonds."

Consider the circumstances in 1972, when pension fund managers were still loading up on stocks: The Dow ended the year at 1020, had an average book value of 625, and earned 11% on book. Six years later, the Dow was 20% cheaper, its book value had gained nearly 40%, and it had earned 13% on book. Or as I wrote then, "Stocks were demonstrably cheaper in 1978 when pension fund managers wouldn't buy them than they were in 1972, when they bought them at record rates."

At the time of the article, long-term corporate bonds were yielding about 9.5%. So I asked this seemingly obvious question: "Can better results be obtained, over 20 years, from a group of 9.5% bonds of leading American companies maturing in 1999 than from a group of Dow-type equities purchased, in aggregate, around book value and likely to earn, in aggregate, about 13% on that book value?" The question answered itself.

Now, if you had read that article in 1979, you would have suffered — oh, how you would have suffered! — for about three years. I was no good then at forecasting the near-term movements of stock prices, and I'm no good now. I never have the faintest idea what the stock market is going to do in the next six months, or the next year, or the next two.

But I think it is very easy to see what is likely to happen over the long term. Ben Graham told us why: "Though the stock market functions as a voting machine in the short run, it acts as a weighing machine in the long run." Fear and greed play important roles when votes are being cast, but they don't register on the scale.

By my thinking, it was not hard to say that, over a 20-year period, a 9.5% bond wasn't going to do as well as this disguised bond called the Dow that you could buy below par — that's book value — and that was earning 13% on par.

Let me explain what I mean by that term I slipped in there, "disguised bond." A bond, as most of you know, comes with a certain maturity and with a string of little coupons. A 6% bond, for example, pays a 3% coupon every six months.

A stock, in contrast, is a financial instrument that has a claim on future distributions made by a given business, whether they are paid out as dividends or to repurchase stock or to settle up after sale or liquidation. These payments are in effect "coupons." The set of owners getting them will change as shareholders come and go. But the financial outcome for the business' owners as a whole will be determined by the size and timing of these coupons. Estimating those particulars is what investment analysis is all about.

Now, gauging the size of those "coupons" gets very difficult for individual stocks. It's easier, though, for groups of stocks. Back in 1978, as I mentioned, we had the Dow earning 13% on its average book value of \$850. The 13% could only be a benchmark, not a guarantee. Still, if you'd been willing then to invest for a period of time in stocks, you were in effect buying a bond — at prices that in 1979 seldom inched above par — with a principal value of \$891 and a quite possible 13% coupon on the principal.

How could that not be better than a 9.5% bond? From that starting point, stocks had to outperform bonds over the long term. That, incidentally, has been true during most of my business lifetime. But as Keynes would remind us, the superiority of stocks isn't inevitable. They own the advantage only when certain conditions prevail.

Let me show you another point about the herd mentality among pension funds — a point perhaps accentuated by a little self-interest on the part of those who oversee the funds. In the table below are four well-known companies — typical of many others I could have selected — and the expected returns on their pension fund assets that they used in calculating what charge (or credit) they should make annually for pensions.

Now, the higher the expectation rate that a company uses for pensions, the higher its reported earnings will be. That's just the way that pension accounting works — and I hope, for the sake of relative brevity, that you'll just take my word for it.

As the table shows, expectations in 1975 were modest: 7% for Exxon, 6% for GE and GM, and under 5% for IBM. The oddity of these assumptions is that investors could then buy long-term government noncallable bonds that paid 8%. In other words, these companies could have loaded up their entire portfolio with 8% no-risk bonds, but they nevertheless used lower assumptions. By 1982, as you can see, they had moved up their assumptions a little bit, most to around 7%. But now you could buy long-term

governments at 10.4%. You could in fact have locked in that yield for decades by buying so-called strips that guaranteed you a 10.4% reinvestment rate. In effect, your idiot nephew could have managed the fund and achieved returns far higher than the investment assumptions corporations were using.

Why in the world would a company be assuming 7.5% when it could get nearly 10.5% on government bonds? The answer is that rear-view mirror again: Investors who'd been through the collapse of the Nifty Fifty in the early 1970s were still feeling the pain of the period and were out of date in their thinking about returns. They couldn't make the necessary mental adjustment.

Now fast-forward to 2000, when we had long-term governments at 5.4%. And what were the four companies saying in their 2000 annual reports about expectations for their pension funds? They were using assumptions of 9.5% and even 10%.

I'm a sporting type, and I would love to make a large bet with the chief financial officer of any one of those four companies, or with their actuaries or auditors, that over the next 15 years they will not average the rates they've postulated. Just look at the math, for one thing. A fund's portfolio is very likely to be one-third bonds, on which — assuming a conservative mix of issues with an appropriate range of maturities — the fund cannot today expect to earn much more than 5%. It's simple to see then that the fund will need to average more than 11% on the two-thirds that's in stocks to earn about 9.5% overall. That's a pretty heroic assumption, particularly given the substantial investment expenses that a typical fund incurs.

Heroic assumptions do wonders, however, for the bottom line. By embracing those expectation rates shown in the far right column, these companies report much higher earnings — much higher — than if they were using lower rates. And that's certainly not lost on the people who set the rates. The actuaries who have roles in this game know nothing special about future investment returns. What they do know, however, is that their clients desire rates that are high. And a happy client is a continuing client.

Are we talking big numbers here? Let's take a look at General Electric, the country's most valuable and most admired company. I'm a huge admirer myself. GE has run its pension fund extraordinarily well for decades, and its assumptions about returns are typical of the crowd. I use the company as an example simply because of its prominence.

If we may retreat to 1982 again, GE recorded a pension charge of \$570 million. That amount cost the company 20% of its pretax earnings. Last year GE recorded a \$1.74 billion pension credit. That was 9% of the company's pretax earnings. And it was 2½ times the appliance division's profit of \$684 million. A \$1.74 billion credit is simply a lot of money. Reduce that pension assumption enough and you wipe out most of the credit.

GE's pension credit, and that of many another corporation, owes its existence to a rule of the Financial Accounting Standards Board that went into effect in 1987. From that point on, companies equipped with the right assumptions and getting the fund performance they needed could start crediting pension income to their income statements. Last year, according to Goldman Sachs, 35 companies in the S&P 500 got more than 10% of their earnings from pension credits, even as, in many cases, the value of their pension investments shrank.

Unfortunately, the subject of pension assumptions, critically important though it is, almost never comes up in corporate board meetings. (I myself have been on 19 boards, and I've never heard a serious discussion of this subject.) And now, of course, the need for discussion is paramount because these assumptions that are being made, with all eyes looking backward at the glories of the 1990s, are so

extreme. I invite you to ask the CFO of a company having a large defined-benefit pension fund what adjustment would need to be made to the company's earnings if its pension assumption was lowered to 6.5%. And then, if you want to be mean, ask what the company's assumptions were back in 1975 when both stocks and bonds had far higher prospective returns than they do now.

With 2001 annual reports soon to arrive, it will be interesting to see whether companies have reduced their assumptions about future pension returns. Considering how poor returns have been recently and the reprises that probably lie ahead, I think that anyone choosing not to lower assumptions — CEOs, auditors, and actuaries all — is risking litigation for misleading investors. And directors who don't question the optimism thus displayed simply won't be doing their job.

The tour we've taken through the last century proves that market irrationality of an extreme kind periodically erupts — and compellingly suggests that investors wanting to do well had better learn how to deal with the next outbreak. What's needed is an antidote, and in my opinion that's quantification. If you quantify, you won't necessarily rise to brilliance, but neither will you sink into craziness.

On a macro basis, quantification doesn't have to be complicated at all. Below is a chart, starting almost 80 years ago and really quite fundamental in what it says. The chart shows the market value of all publicly traded securities as a percentage of the country's business — that is, as a percentage of GNP. The ratio has certain limitations in telling you what you need to know. Still, it is probably the best single measure of where valuations stand at any given moment. And as you can see, nearly two years ago the ratio rose to an unprecedented level. That should have been a very strong warning signal.

For investors to gain wealth at a rate that exceeds the growth of U.S. business, the percentage relationship line on the chart must keep going up and up. If GNP is going to grow 5% a year and you want market values to go up 10%, then you need to have the line go straight off the top of the chart. That won't happen.

For me, the message of that chart is this: If the percentage relationship falls to the 70% or 80% area, buying stocks is likely to work very well for you. If the ratio approaches 200% — as it did in 1999 and a part of 2000 — you are playing with fire. As you can see, the ratio was recently 133%.

Even so, that is a good-sized drop from when I was talking about the market in 1999. I ventured then that the American public should expect equity returns over the next decade or two (with dividends included and 2% inflation assumed) of perhaps 7%. That was a gross figure, not counting frictional costs, such as commissions and fees. Net, I thought returns might be 6%.

Today stock market "hamburgers," so to speak, are cheaper. The country's economy has grown and stocks are lower, which means that investors are getting more for their money. I would expect now to see long-term returns run somewhat higher, in the neighborhood of 7% after costs. Not bad at all — that is, unless you're still deriving your expectations from the 1990s.

PHOTOGRAPHS BY MARTIN SCHOELLER — CORBIS SABA

"When hamburgers go down in price, we sing 'Hallelujah' in the Buffett household. When they go up, we weep. For most of us, it's the same with everything we will be buying — except stocks."

The U.S. never stopped growing: Per capita GNP gains crept in the 20th century's early years. But if you think of the U.S. as a stock, it was overall one helluva mover

GRAPH: The market has been a wild thing: The value of U.S. stocks vs. GNP has avalanched since 2000. But October's ratio of 133% still tops the 1929 peak.

America's growing trade deficit is selling the nation out from under us. Here's a way to fix the problem – and we need to do it now

11/20/2003

I'm about to deliver a warning regarding the U.S. trade deficit and also suggest a remedy for the problem. But first I need to mention two reasons you might want to be skeptical about what I say. To begin, my forecasting record with respect to macroeconomics is far from inspiring. For example, over the past two decades I was excessively fearful of inflation. More to the point at hand, I started way back in 1987 to publicly worry about our mounting trade deficits--and, as you know, we've not only survived but also thrived. So on the trade front, score at least one "wolf" for me. Nevertheless, I am crying wolf again and this time backing it with Berkshire Hathaway's money. Through the spring of 2002, I had lived nearly 72 years without purchasing a foreign currency. Since then Berkshire has made significant investments in--and today holds--several currencies. I won't give you particulars; in fact, it is largely irrelevant which currencies they are. What does matter is the underlying point: To hold other currencies is to believe that the dollar will decline.

Both as an American and as an investor, I actually hope these commitments prove to be a mistake. Any profits Berkshire might make from currency trading would pale against the losses the company and our shareholders, in other aspects of their lives, would incur from a plunging dollar.

But as head of Berkshire Hathaway, I am in charge of investing its money in ways that make sense. And my reason for finally putting my money where my mouth has been so long is that our trade deficit has greatly worsened, to the point that our country's "net worth," so to speak, is now being transferred abroad at an alarming rate.

A perpetuation of this transfer will lead to major trouble. To understand why, take a wildly fanciful trip with me to two isolated, side-by-side islands of equal size, Squanderville and Thriftville. Land is the only capital asset on these islands, and their communities are primitive, needing only food and producing only food. Working eight hours a day, in fact, each inhabitant can produce enough food to sustain himself or herself. And for a long time that's how things go along. On each island everybody works the prescribed eight hours a day, which means that each society is self-sufficient.

Eventually, though, the industrious citizens of Thriftville decide to do some serious saving and investing, and they start to work 16 hours a day. In this mode they continue to live off the food they produce in eight hours of work but begin exporting an equal amount to their one and only trading outlet, Squanderville.

The citizens of Squanderville are ecstatic about this turn of events, since they can now live their lives free from toil but eat as well as ever. Oh, yes, there's a quid pro quo--but to the Squanders, it seems harmless: All that the Thrifts want in exchange for their food is Squanderbonds (which are denominated, naturally, in Squanderbucks).

Over time Thriftville accumulates an enormous amount of these bonds, which at their core represent claim checks on the future output of Squanderville. A few pundits in Squanderville smell trouble coming. They foresee that for the Squanders both to eat and to pay off--or simply service--the debt they're piling up will eventually require them to work more than eight hours a day. But the residents of Squanderville are in no mood to listen to such doomsaying.

Meanwhile, the citizens of Thriftville begin to get nervous. Just how good, they ask, are the IOUs of a shiftless island? So the Thrifts change strategy: Though they continue to hold some bonds, they sell most

of them to Squanderville residents for Squanderbucks and use the proceeds to buy Squanderville land. And eventually the Thrifts own all of Squanderville.

At that point, the Squanders are forced to deal with an ugly equation: They must now not only return to working eight hours a day in order to eat--they have nothing left to trade--but must also work additional hours to service their debt and pay Thriftville rent on the land so imprudently sold. In effect, Squanderville has been colonized by purchase rather than conquest.

It can be argued, of course, that the present value of the future production that Squanderville must forever ship to Thriftville only equates to the production Thriftville initially gave up and that therefore both have received a fair deal. But since one generation of Squanders gets the free ride and future generations pay in perpetuity for it, there are--in economist talk--some pretty dramatic "intergenerational inequities."

Let's think of it in terms of a family: Imagine that I, Warren Buffett, can get the suppliers of all that I consume in my lifetime to take Buffett family IOUs that are payable, in goods and services and with interest added, by my descendants. This scenario may be viewed as effecting an even trade between the Buffett family unit and its creditors. But the generations of Buffetts following me are not likely to applaud the deal (and, heaven forbid, may even attempt to welsh on it).

Think again about those islands: Sooner or later the Squanderville government, facing ever greater payments to service debt, would decide to embrace highly inflationary policies--that is, issue more Squanderbucks to dilute the value of each. After all, the government would reason, those irritating Squanderbonds are simply claims on specific numbers of Squanderbucks, not on bucks of specific value. In short, making Squanderbucks less valuable would ease the island's fiscal pain.

That prospect is why I, were I a resident of Thriftville, would opt for direct ownership of Squanderville land rather than bonds of the island's government. Most governments find it much harder morally to seize foreign-owned property than they do to dilute the purchasing power of claim checks foreigners hold. Theft by stealth is preferred to theft by force.

So what does all this island hopping have to do with the U.S.? Simply put, after World War II and up until the early 1970s we operated in the industrious Thriftville style, regularly selling more abroad than we purchased. We concurrently invested our surplus abroad, with the result that our net investment--that is, our holdings of foreign assets less foreign holdings of U.S. assets--increased (under methodology, since revised, that the government was then using) from \$37 billion in 1950 to \$68 billion in 1970. In those days, to sum up, our country's "net worth," viewed in totality, consisted of all the wealth within our borders plus a modest portion of the wealth in the rest of the world.

Additionally, because the U.S. was in a net ownership position with respect to the rest of the world, we realized net investment income that, piled on top of our trade surplus, became a second source of investable funds. Our fiscal situation was thus similar to that of an individual who was both saving some of his salary and reinvesting the dividends from his existing nest egg.

In the late 1970s the trade situation reversed, producing deficits that initially ran about 1% of GDP. That was hardly serious, particularly because net investment income remained positive. Indeed, with the power of compound interest working for us, our net ownership balance hit its high in 1980 at \$360 billion.

Since then, however, it's been all downhill, with the pace of decline rapidly accelerating in the past five years. Our annual trade deficit now exceeds 4% of GDP. Equally ominous, the rest of the world owns a staggering \$2.5 trillion more of the U.S. than we own of other countries. Some of this \$2.5 trillion is

invested in claim checks--U.S. bonds, both governmental and private--and some in such assets as property and equity securities.

In effect, our country has been behaving like an extraordinarily rich family that possesses an immense farm. In order to consume 4% more than we produce--that's the trade deficit--we have, day by day, been both selling pieces of the farm and increasing the mortgage on what we still own.

To put the \$2.5 trillion of net foreign ownership in perspective, contrast it with the \$12 trillion value of publicly owned U.S. stocks or the equal amount of U.S. residential real estate or what I would estimate as a grand total of \$50 trillion in national wealth. Those comparisons show that what's already been transferred abroad is meaningful--in the area, for example, of 5% of our national wealth.

More important, however, is that foreign ownership of our assets will grow at about \$500 billion per year at the present trade-deficit level, which means that the deficit will be adding about one percentage point annually to foreigners' net ownership of our national wealth. As that ownership grows, so will the annual net investment income flowing out of this country. That will leave us paying ever-increasing dividends and interest to the world rather than being a net receiver of them, as in the past. We have entered the world of negative compounding--goodbye pleasure, hello pain.

We were taught in Economics 101 that countries could not for long sustain large, ever-growing trade deficits. At a point, so it was claimed, the spree of the consumption-happy nation would be braked by currency-rate adjustments and by the unwillingness of creditor countries to accept an endless flow of IOUs from the big spenders. And that's the way it has indeed worked for the rest of the world, as we can see by the abrupt shutoffs of credit that many profligate nations have suffered in recent decades.

The U.S., however, enjoys special status. In effect, we can behave today as we wish because our past financial behavior was so exemplary--and because we are so rich. Neither our capacity nor our intention to pay is questioned, and we continue to have a mountain of desirable assets to trade for consumables. In other words, our national credit card allows us to charge truly breathtaking amounts. But that card's credit line is not limitless.

The time to halt this trading of assets for consumables is now, and I have a plan to suggest for getting it done. My remedy may sound gimmicky, and in truth it is a tariff called by another name. But this is a tariff that retains most free-market virtues, neither protecting specific industries nor punishing specific countries nor encouraging trade wars. This plan would increase our exports and might well lead to increased overall world trade. And it would balance our books without there being a significant decline in the value of the dollar, which I believe is otherwise almost certain to occur.

We would achieve this balance by issuing what I will call Import Certificates (ICs) to all U.S. exporters in an amount equal to the dollar value of their exports. Each exporter would, in turn, sell the ICs to parties--either exporters abroad or importers here--wanting to get goods into the U.S. To import \$1 million of goods, for example, an importer would need ICs that were the byproduct of \$1 million of exports. The inevitable result: trade balance.

Because our exports total about \$80 billion a month, ICs would be issued in huge, equivalent quantities--that is, 80 billion certificates a month--and would surely trade in an exceptionally liquid market. Competition would then determine who among those parties wanting to sell to us would buy the certificates and how much they would pay. (I visualize that the certificates would be issued with a short life, possibly of six months, so that speculators would be discouraged from accumulating them.)

For illustrative purposes, let's postulate that each IC would sell for 10 cents--that is, 10 cents per dollar of exports behind them. Other things being equal, this amount would mean a U.S. producer could realize 10% more by selling his goods in the export market than by selling them domestically, with the extra 10% coming from his sales of ICs.

In my opinion, many exporters would view this as a reduction in cost, one that would let them cut the prices of their products in international markets. Commodity-type products would particularly encourage this kind of behavior. If aluminum, for example, was selling for 66 cents per pound domestically and ICs were worth 10%, domestic aluminum producers could sell for about 60 cents per pound (plus transportation costs) in foreign markets and still earn normal margins. In this scenario, the output of the U.S. would become significantly more competitive and exports would expand. Along the way, the number of jobs would grow.

Foreigners selling to us, of course, would face tougher economics. But that's a problem they're up against no matter what trade "solution" is adopted--and make no mistake, a solution must come. (As Herb Stein said, "If something cannot go on forever, it will stop.") In one way the IC approach would give countries selling to us great flexibility, since the plan does not penalize any specific industry or product. In the end, the free market would determine what would be sold in the U.S. and who would sell it. The ICs would determine only the aggregate dollar volume of what was sold.

To see what would happen to imports, let's look at a car now entering the U.S. at a cost to the importer of \$20,000. Under the new plan and the assumption that ICs sell for 10%, the importer's cost would rise to \$22,000. If demand for the car was exceptionally strong, the importer might manage to pass all of this on to the American consumer. In the usual case, however, competitive forces would take hold, requiring the foreign manufacturer to absorb some, if not all, of the \$2,000 IC cost.

There is no free lunch in the IC plan: It would have certain serious negative consequences for U.S. citizens. Prices of most imported products would increase, and so would the prices of certain competitive products manufactured domestically. The cost of the ICs, either in whole or in part, would therefore typically act as a tax on consumers.

That is a serious drawback. But there would be drawbacks also to the dollar continuing to lose value or to our increasing tariffs on specific products or instituting quotas on them--courses of action that in my opinion offer a smaller chance of success. Above all, the pain of higher prices on goods imported today dims beside the pain we will eventually suffer if we drift along and trade away ever larger portions of our country's net worth.

I believe that ICs would produce, rather promptly, a U.S. trade equilibrium well above present export levels but below present import levels. The certificates would moderately aid all our industries in world competition, even as the free market determined which of them ultimately met the test of "comparative advantage."

This plan would not be copied by nations that are net exporters, because their ICs would be valueless. Would major exporting countries retaliate in other ways? Would this start another Smoot-Hawley tariff war? Hardly. At the time of Smoot-Hawley we ran an unreasonable trade surplus that we wished to maintain. We now run a damaging deficit that the whole world knows we must correct.

For decades the world has struggled with a shifting maze of punitive tariffs, export subsidies, quotas, dollar-locked currencies, and the like. Many of these import-inhibiting and export-encouraging devices have long been employed by major exporting countries trying to amass ever larger surpluses--yet

significant trade wars have not erupted. Surely one will not be precipitated by a proposal that simply aims at balancing the books of the world's largest trade debtor. Major exporting countries have behaved quite rationally in the past and they will continue to do so--though, as always, it may be in their interest to attempt to convince us that they will behave otherwise.

The likely outcome of an IC plan is that the exporting nations--after some initial posturing--will turn their ingenuity to encouraging imports from us. Take the position of China, which today sells us about \$140 billion of goods and services annually while purchasing only \$25 billion. Were ICs to exist, one course for China would be simply to fill the gap by buying 115 billion certificates annually. But it could alternatively reduce its need for ICs by cutting its exports to the U.S. or by increasing its purchases from us. This last choice would probably be the most palatable for China, and we should wish it to be so.

If our exports were to increase and the supply of ICs were therefore to be enlarged, their market price would be driven down. Indeed, if our exports expanded sufficiently, ICs would be rendered valueless and the entire plan made moot. Presented with the power to make this happen, important exporting countries might quickly eliminate the mechanisms they now use to inhibit exports from us.

Were we to install an IC plan, we might opt for some transition years in which we deliberately ran a relatively small deficit, a step that would enable the world to adjust as we gradually got where we need to be. Carrying this plan out, our government could either auction "bonus" ICs every month or simply give them, say, to less-developed countries needing to increase their exports. The latter course would deliver a form of foreign aid likely to be particularly effective and appreciated.

I will close by reminding you again that I cried wolf once before. In general, the batting average of doomsayers in the U.S. is terrible. Our country has consistently made fools of those who were skeptical about either our economic potential or our resiliency. Many pessimistic seers simply underestimated the dynamism that has allowed us to overcome problems that once seemed ominous. We still have a truly remarkable country and economy.

But I believe that in the trade deficit we also have a problem that is going to test all of our abilities to find a solution. A gently declining dollar will not provide the answer. True, it would reduce our trade deficit to a degree, but not by enough to halt the outflow of our country's net worth and the resulting growth in our investment-income deficit.

Perhaps there are other solutions that make more sense than mine. However, wishful thinking--and its usual companion, thumb sucking--is not among them. From what I now see, action to halt the rapid outflow of our national wealth is called for, and ICs seem the least painful and most certain way to get the job done. Just keep remembering that this is not a small problem: For example, at the rate at which the rest of the world is now making net investments in the U.S., it could annually buy and sock away nearly 4% of our publicly traded stocks.

In evaluating business options at Berkshire, my partner, Charles Munger, suggests that we pay close attention to his jocular wish: "All I want to know is where I'm going to die, so I'll never go there." Framers of our trade policy should heed this caution--and steer clear of Squanderville.

WHY FOREIGNERS CAN'T DITCH THEIR DOLLARS

How often have you seen a comment like this in articles about the U.S. dollar? "Analysts say that what really worries them is that foreigners will start moving out of the dollar."

[More Compilations](#)

Next time you see something like that, dismiss it. The fact is that foreigners--as a whole--cannot ditch their dollars. Indeed, because our trade deficit is constantly putting new dollars into the hands of foreigners, they have to just as constantly increase their U.S. investments.

It's true, of course, that the rest of the world can choose which U.S. assets to hold. They can decide, for example, to sell U.S. bonds to buy U.S. stocks. Or they can make a move into real estate, as the Japanese did in the 1980s. Moreover, any of those moves, particularly if they are carried out by anxious sellers or buyers, can influence the price of the dollar.

But imagine that the Japanese both want to get out of their U.S. real estate and entirely away from dollar assets. They can't accomplish that by selling their real estate to Americans, because they will get paid in dollars. And if they sell their real estate to non-Americans--say, the French, for euros--the property will remain in the hands of foreigners. With either kind of sale, the dollar assets held by the rest of the world will not (except for any concurrent shift in the price of the dollar) have changed.

The bottom line is that other nations simply can't disinvest in the U.S. unless they, as a universe, buy more goods and services from us than we buy from them. That state of affairs would be called an American trade surplus, and we don't have one.

You can dream up some radical plots for changing the situation. For example, the rest of the world could send the U.S. massive foreign aid that would serve to offset our trade deficit. But under any realistic view of things, our huge trade deficit guarantees that the rest of the world must not only hold the American assets it owns but consistently add to them. And that's why, of course, our national net worth is gradually shifting away from our shores.

Billionaire Shares

2007

“I don’t look to jump over 7-foot bars; I look around for 1-foot bars that I can step over.” —Warren Buffett

Performance at all levels of business, comes down to fundamentals and patience, two ingredients many forget in today’s over energetic marketplace according to Buffett. Consider some fundamental ingredients to success that Buffett has shared repeatedly over the years and which many seem to forget. This from a man who turned his \$9,800.00 savings, mostly from his paper route, into a personal net worth estimated by Forbes at more than \$42 billion. From 1965 through 2006, the reign of Warren Buffett known to many as the *Oracle of Omaha*, the BERKSHIRE HATHAWAY stock has grown more than 194,936 percent or 22-plus percent each year.

Q. On the issue of leadership reform or corporate Boardroom advocate to change?

A. “A checklist is no substitute for thinking.” If every shot was a hole in one it wouldn’t make the game very interesting. You have to hit balls in the woods a few times to learn how to invest and how to lead others to performance standards.

Q. When making financial decisions, what serves as your benchmark for making decisions in the midst of all the corporate implosions today and in recent history?

A. I will keep well over 99 percent of my net worth in Berkshire. My wife and I have never sold a share nor do we intend to. Charlie (Charlie Munger Buffett’s senior most partner and advisor for many years) and I are disgusted by the situation, so common in the last few years, in which shareholders have suffered billions in losses while the CEOs, promoters, and other higher-ups who fathered these disasters have walked away with extraordinary wealth. Indeed, many of these people were urging investors to buy shares while concurrently dumping their own, sometimes using methods that hide their actions. To their shame, these business leaders view shareholders as patsies, not partners.

Though Enron has become the symbol for shareholder abuse, there is no shortage of egregious conduct elsewhere in corporate America. One story I’ve heard illustrated the all-too-common attitude of managers toward owners: A gorgeous woman slinks up to a CEO at a party and through most lips purrs, “I’ll do anything ? anything ? you want. Just tell me what you would like.” With no hesitation, he replies, “Reprice my options.”

Q. What are some of the best ways to generate internal organizational success today?

A. For us it has been being consistently shrewd as a buyer, we simply will not overpay, and being patient in waiting for opportunities. We have learned to farm future opportunities from those that are with you presently. We regularly put an “ad” in our annual report explaining what kind of businesses we’d like to buy. “For the right business—and the right people—we can provide a good home. Berkshire has made millions from deals brought to us from internal advertising.

Q. Is discipline important to performance success?

A. Most Americans have become “rich spending junkies” who could turn into a nation of “sharecroppers” very quickly. There is not patience, everyone wants immediate success, and there is little self-discipline today. Much success can be attributed to inactivity. Most investors cannot resist the temptation to constantly buy and sell.

Q. What lessons from investing have you learned could be applied to personal and organizational performance success?

A. What counts for most people in investing is not how much they know, but rather how realistically they define what they don't know. An investor needs to do very few things right as long as he or she avoids big mistakes. "If you're an investor, you're looking on what the asset is going to do, if you're a speculator, you're commonly focusing on what the price of the object is going to do, and that's not our game. Obviously, every investor will make mistakes. But by confining himself to a relatively few, easy-to-understand cases, a reasonably intelligent, informed and diligent person can judge investment risks with a useful degree of accuracy.

Q. For an individual to attain higher levels of peak performance today, what advice would you give to them?

A. The most important thing in terms of your circle of competence is not how large the area of it is, but how well you've defined the perimeter. If you know where the edges are, you're way better off than somebody that's got one that's five times as large but they very fuzzy about the edges.

"John Maynard Keynes, whose brilliance as a practicing investor matched his brilliance in thought, wrote a letter to a business associate, F.C. Scott, on August 15, 1934 that says it all: 'As time goes on, I get more and more convinced that the right method in investment is to put fairly large sums into enterprises which one thinks one knows something about and in the management of which one thoroughly believes. It is a mistake to think that one limits one's risk by spreading too much between enterprises about which one knows little and has no reason for special confidence.'" One's knowledge and experience are definitely limited and there are seldom more than two or three enterprises at any given time in which I personally feel myself entitled to put full confidence.

Warren Buffett was born in Omaha, Nebraska USA on the 30th of August in 1930. He is one of the world's richest men, with a fortune that is only surpassed by Bill Gates of Microsoft fame. He is considered one of the most successful investors of all time.

Buffett was born to Leila and Howard Buffett and was the second of three children, he being the only boy. Buffett's father, Howard was a stockbroker and also became a member of congress. Warren Buffett showed early signs of being entrepreneurial through being involved in various business dealings as a child, including purchasing bottles of cola cheaply and selling them for a profit. He also made his first investment in the stock market when he was just 11 years old.

Buffett was very influenced by Benjamin Graham and went to work for him in his company "Graham Newman". It was here that Buffett developed many of his stock market investing skills that have now become legendary. Graham developed a method where investors could work out the intrinsic value of a company and make intelligent investing decisions by comparing the stock price to the intrinsic value.

After Graham's retirement, Buffett returned to Omaha and began a limited investing fund partnership with a group of friends, family and associates. The "Buffett Partnerships Ltd" fund racked up amazing returns for its investors over a ten year period, with returns 10 times higher than the Dow Jones Industrial average for the same time. Buffett liquidated the fund and took control of the textile company Berkshire Hathaway.

It was a difficult time for the textile industry and Buffett eventually wound up Berkshire Hathaway's textile activities, but kept the name for Buffett's portfolio of companies and investments. The insurance industry was the first major area of success that Berkshire Hathaway had, with the funds used to acquire carefully selected investments each year. Major undervalued companies that Buffett took advantage of included "American Express", "Coca-Cola" "The Washington Post" and "Gillette".

In June 2006 Buffett announced plans to give much of his wealth away while he is still living. The majority of the Buffett billions will go to the foundation of his Bridge partner and friend of fifteen years, Bill Gates.

Buy American. I am.

10/16/2008

The financial world is a mess, both in the United States and abroad. Its problems, moreover, have been leaking into the general economy, and the leaks are now turning into a gusher. In the near term, unemployment will rise, business activity will falter and headlines will continue to be scary.

So ... I've been buying American stocks. This is my personal account I'm talking about, in which I previously owned nothing but United States government bonds. (This description leaves aside my Berkshire Hathaway holdings, which are all committed to philanthropy.) If prices keep looking attractive, my non-Berkshire net worth will soon be 100 percent in United States equities.

Why?

A simple rule dictates my buying: Be fearful when others are greedy, and be greedy when others are fearful. And most certainly, fear is now widespread, gripping even seasoned investors. To be sure, investors are right to be wary of highly leveraged entities or businesses in weak competitive positions. But fears regarding the long-term prosperity of the nation's many sound companies make no sense. These businesses will indeed suffer earnings hiccups, as they always have. But most major companies will be setting new profit records 5, 10 and 20 years from now.

Let me be clear on one point: I can't predict the short-term movements of the stock market. I haven't the faintest idea as to whether stocks will be higher or lower a month — or a year — from now. What is likely, however, is that the market will move higher, perhaps substantially so, well before either sentiment or the economy turns up. So if you wait for the robins, spring will be over.

A little history here: During the Depression, the Dow hit its low, 41, on July 8, 1932. Economic conditions, though, kept deteriorating until Franklin D. Roosevelt took office in March 1933. By that time, the market had already advanced 30 percent. Or think back to the early days of World War II, when things were going badly for the United States in Europe and the Pacific. The market hit bottom in April 1942, well before Allied fortunes turned. Again, in the early 1980s, the time to buy stocks was when inflation raged and the economy was in the tank. In short, bad news is an investor's best friend. It lets you buy a slice of America's future at a marked-down price.

Over the long term, the stock market news will be good. In the 20th century, the United States endured two world wars and other traumatic and expensive military conflicts; the Depression; a dozen or so recessions and financial panics; oil shocks; a flu epidemic; and the resignation of a disgraced president. Yet the Dow rose from 66 to 11,497.

You might think it would have been impossible for an investor to lose money during a century marked by such an extraordinary gain. But some investors did. The hapless ones bought stocks only when they felt comfort in doing so and then proceeded to sell when the headlines made them queasy.

Today people who hold cash equivalents feel comfortable. They shouldn't. They have opted for a terrible long-term asset, one that pays virtually nothing and is certain to depreciate in value. Indeed, the policies that government will follow in its efforts to alleviate the current crisis will probably prove inflationary and therefore accelerate declines in the real value of cash accounts.

Equities will almost certainly outperform cash over the next decade, probably by a substantial degree. Those investors who cling now to cash are betting they can efficiently time their move away from it later.

[More Compilations](#)

In waiting for the comfort of good news, they are ignoring Wayne Gretzky's advice: "I skate to where the puck is going to be, not to where it has been."

I don't like to opine on the stock market, and again I emphasize that I have no idea what the market will do in the short term. Nevertheless, I'll follow the lead of a restaurant that opened in an empty bank building and then advertised: "Put your mouth where your money was." Today my money and my mouth both say equities.

Warren E. Buffett is the chief executive of Berkshire Hathaway, a diversified holding company

Our country has faced far worse travails

3/9/2009

A paralyzing fear has engulfed the country. But America's best days lie ahead.

Warren Buffett's annual letter to Berkshire Hathaway share-holders is a highly anticipated, market-moving event. This year Buffett, who is a director of The Washington Post Company, NEWSWEEK's parent, offered his views on the brutal business climate. Edited excerpts:

Over the last 44 years (that is, since present management took over), the book value of Berkshire Hathaway Inc. has grown from \$19 to \$70,530, a rate of 20.3 percent compounded annually. But 2008 was the worst of those 44 years for both Berkshire's book value and the S&P 500 index. The period was devastating as well for corporate and municipal bonds, real estate and commodities. By year-end, investors of all stripes were bloodied and confused, much as if they were small birds that had strayed into a badminton game.

As the year progressed, a series of life-threatening problems within many of the world's great financial institutions was unveiled. This led to a dysfunctional credit market that in important respects soon turned non-functional. The watchword throughout the country became the creed I saw on restaurant walls when I was young: "In God we trust; all others pay cash."

By the fourth quarter, the credit crisis, coupled with tumbling home and stock prices, had produced a paralyzing fear that engulfed the country. A freefall in business activity ensued, accelerating at a pace that I have never before witnessed. The U.S. -- and much of the world -- became trapped in a vicious negative-feedback cycle. Fear led to business contraction, and that in turn led to even greater fear.

This debilitating spiral has spurred our government to take massive action. In poker terms, the Treasury and the Fed have gone "all in." Economic medicine that was previously meted out by the cupful has recently been dispensed by the barrel. These once-unthinkable dosages will almost certainly bring on unwelcome after-effects. Their precise nature is anyone's guess, though one likely consequence is an onslaught of inflation. Moreover, major industries have become dependent on Federal assistance, and they will be followed by cities and states bearing mind boggling requests. Weaning these entities from the public teat will be a political challenge. They won't leave willingly.

Whatever the downsides may be, strong and immediate action by government was essential if the financial system was to avoid a total breakdown. Had that occurred, the consequences for every area of our economy would have been cataclysmic. Like it or not, the inhabitants of Wall Street, Main Street and the various Side Streets of America were all in the same boat.

Amid this bad news, however, never forget that our country has faced far worse travails. In the 20th century alone, we dealt with two great wars (one of which we initially appeared to be losing); a dozen or so panics and recessions; virulent inflation that led to a 21 percent prime rate in 1980; and the Great Depression of the 1930s, when unemployment ranged between 15 percent and 25 percent for many years. America has had no shortage of challenges.

Without fail, however, we've overcome them. In the face of those obstacles -- and many others -- the real standard of living for Americans improved nearly seven-fold during the 1900s, while the Dow Jones Industrials rose from 66 to 11,497. Compare this with the dozens of centuries during which humans secured only tiny gains, if any, in how they lived. Though the path has not been smooth, our economic

[More Compilations](#)

system has worked extraordinarily well over time. It has unleashed human potential as no other system has, and it will continue to do so. America's best days lie ahead.

SMART LENDERS DIDN'T BET ON RISING HOME PRICES

One of Berkshire Hathaway's businesses is Clayton Homes, the largest company in the manufactured-home industry. Its recent experience may be useful in the public policy debate about housing and mortgages.

[During the 1990s] much of the manufactured-home industry employed sales practices that were atrocious. The need for meaningful down payments was frequently ignored. Sometimes fakery was involved. Moreover, impossible-to-meet monthly payments were being agreed to by borrowers who signed up because they had nothing to lose. The resulting mortgages were usually packaged ("securitized") and sold by Wall Street firms to unsuspecting investors. This chain of folly had to end badly, and it did.

Clayton, it should be emphasized, followed far more sensible practices in its own lending. Indeed, no purchaser of the mortgages it originated and then securitized has ever lost a dime of principal or interest. But Clayton was the exception; industry losses were staggering. And the hangover continues to this day.

This 1997-2000 fiasco should have served as a canary-in-the-coal-mine warning for the far-larger conventional housing market. But investors, government and rating agencies learned exactly nothing from the manufactured-home debacle. Instead, in an eerie rerun of that disaster, the same mistakes were repeated with conventional homes in the 2004-07 period: Lenders happily made loans that borrowers couldn't repay out of their incomes, and borrowers just as happily signed up to meet those payments. Both parties counted on "house-price appreciation" to make this otherwise impossible arrangement work. It was Scarlett O'Hara all over again: "I'll think about that tomorrow." The consequences of this behavior are now reverberating through every corner of our economy.

Clayton's 198,888 borrowers, however, have continued to pay normally throughout the housing crash. Why are our borrowers -- characteristically people with modest incomes and far-from-great credit scores -- performing so well? The answer is elementary, going right back to Lending 101. Our borrowers simply looked at how full-bore mortgage payments would compare with their actual -- not hoped-for -- income and then decided whether they could live with that commitment. Simply put, they took out a mortgage with the intention of paying it off, whatever the course of home prices.

Just as important is what our borrowers did not do. They did not count on making their loan payments by refinancing. They did not sign up for "teaser" rates that upon reset were outsized relative to their income. And they did not assume that they could always sell their home at a profit if their mortgage payments became onerous. Jimmy Stewart would have loved these folks.

Of course, a number of our borrowers will run into trouble. They generally have no more than minor savings to tide them over if adversity hits. The major cause of delinquency or foreclosure is the loss of a job, but death, divorce and medical expenses all cause problems. If unemployment rates rise -- as they surely will in 2009 -- more of Clayton's borrowers will have troubles, and we will have larger, though still manageable, losses. But our problems will not be driven to any extent by the trend of home prices.

Commentary about the current housing crisis often ignores the crucial fact that most foreclosures do not occur because a house is worth less than its mortgage (so-called "upside-down" loans). Rather, foreclosures take place because borrowers can't pay the monthly payment. Homeowners who have made a meaningful down payment -- derived from savings and not from other borrowing -- seldom walk away

from a primary residence simply because its value today is less than the mortgage. Instead, they walk when they can't make the monthly payments.

Homeownership is a wonderful thing. My family and I have enjoyed my present home for 50 years, with more to come. But enjoyment and utility should be the primary motives for purchase, not profit or refi possibilities. And the home purchased ought to fit the income of the purchaser.

The present housing debacle should teach homebuyers, lenders, brokers and government some simple lessons that will ensure stability in the future. Home purchases should involve an honest-to-God down payment of at least 10 percent and monthly payments that can be comfortably handled by the borrower's income. That income should be carefully verified. Putting people into homes, though a desirable goal, shouldn't be our country's primary objective. Keeping them in their homes should be the ambition.

THE LATEST BUBBLE: TREASURY BONDS

Last year I made a major mistake of commission (and maybe more; this one sticks out). I bought a large amount of ConocoPhillips stock when oil and gas prices were near their peak. I in no way anticipated the dramatic fall in energy prices that occurred in the last half of the year. I still believe the odds are good that oil sells far higher in the future than the current \$40-\$50 price. But so far I have been dead wrong. Even if prices should rise, moreover, the terrible timing of my purchase has cost Berkshire several billion dollars...

On the plus side last year, we made purchases totaling \$14.6 billion in fixed-income securities issued by Wrigley, Goldman Sachs and General Electric. We very much like these commitments, which carry high current yields that, in themselves, make the investments more than satisfactory. But in each of these three purchases, we also acquired substantial equity participation as a bonus. To fund these large purchases, I had to sell portions of some holdings that I would have preferred to keep (primarily Johnson & Johnson, Procter & Gamble and ConocoPhillips). However, I have pledged -- to you, the rating agencies and myself -- to always run Berkshire with more than ample cash. We never want to count on the kindness of strangers in order to meet tomorrow's obligations. When forced to choose, I will not trade even a night's sleep for the chance of extra profits.

The investment world has gone from underpricing risk to overpricing it. This change has not been minor; the pendulum has covered an extraordinary arc. A few years ago, it would have seemed unthinkable that yields like today's could have been obtained on good-grade municipal or corporate bonds even while risk-free governments offered near-zero returns on short-term bonds and no better than a pittance on long-terms. When the financial history of this decade is written, it will surely speak of the Internet bubble of the late 1990s and the housing bubble of the early 2000s. But the U.S. Treasury bond bubble of late 2008 may be regarded as almost equally extraordinary.

Clinging to cash equivalents or long-term government bonds at present yields is almost certainly a terrible policy if continued for long. Holders of these instruments, of course, have felt increasingly comfortable -- in fact, almost smug -- in following this policy as financial turmoil has mounted. They regard their judgment confirmed when they hear commentators proclaim "cash is king," even though that wonderful cash is earning close to nothing and will surely find its purchasing power eroded over time.

Approval, though, is not the goal of investing. In fact, approval is often counter-productive because it sedates the brain and makes it less receptive to new facts or a re-examination of conclusions formed earlier. Beware the investment activity that produces applause; the great moves are usually greeted by yawns.

Rating agencies still under the spotlight

Summer 2010

THE ROLE OF RATINGS agencies remains extremely controversial two years after the financial crisis - despite United States billionaire investor Warren Buffett having come to their defence. Biggest criticism is that they exacerbated the credit crisis. The "big three" in particular – Standard & Poor's (S&P), Moody's and Fitch – gave triple A ratings to hundreds of billions of US dollars of bonds backed by risky mortgages. Many of those securities have since been downgraded and are worthless.

The mistakes made by raters in the run-up to the financial crisis shot to prominence after a US Senate hearing in mid-April that uncovered embarrassing emails from rating agency employees expressing misgivings about ratings for bonds linked to dubious mortgages.

Raters already face a record number of lawsuits related to mistakes made on mortgage-backed securities. S&P alone faces well over 30 separate law suits from investors and institutions. Investors argue in such cases the raters committed either fraud or gross negligence in granting high ratings to structured products that later went sour.

To some extent the raters' saving grace in the US is that they're protected by the first amendment right to free speech. Ratings are held to be "opinion" and therefore subject to free speech protections. Whether that will continue to be the case is a key factor in the debate about the future of the industry.

Buffett told the Senate hearing that rating agencies got the US housing bubble no more wrong than (almost) anyone else. But neither critics nor regulators have been willing to take that lying down. Said Buffett: "I'd say they made a mistake that virtually everybody in the country made. There was the greatest bubble I've ever seen in my life... Very, very few people could appreciate the bubble - and that's the nature of bubbles. Rising prices are a narcotic that affects the reasoning power up and down the line."

Legislation was passed in Europe last year requiring raters to rotate analysts to help ensure objectivity in ratings and to disclose compensation agreements with clients. Brussels has also proposed putting raters operating in Europe under the supervision of the new pan-European Union regulatory authority, the European Securities and Markets Authority (ESMA). Under its proposed rules raters operating in the EU would have to register with ESMA, which would then have exclusive supervisory powers over their activities.

However, the issues remain complex. Though major demands have been made for greater general disclosure, past experience has shown that doesn't work. For example. Wall Street firms send out hundreds of millions of pages of disclosures each year, but generally few individuals read them and even fewer understand them.

Another difficulty has been compensation of credit rating agencies. They have to conduct extensive research to produce reliable ratings and that research is very costly. In most cases it's funded by issuers of securities seeking high ratings for their products, who consequently direct their business to those agencies most willing to provide such ratings.

A US Congressional investigation in April found both Moody's and S&P were unduly influenced in assigning ratings on collateralised debt obligations (CDOs) by investment bankers who paid their fees.

Part of the answer has been moves by regulators to have rating agencies themselves rated and to distinguish between investment and speculative grade securities. The US Senate is looking to create rules under which an independent regulatory board would choose raters.

[More Compilations](#)

Meanwhile, raters themselves have undertaken reviews aimed at restoring confidence, particularly on the structured finance part of their businesses, where most of the controversies have been. S&P president Deven Sharma conceded in a public statement that "the performance of our ratings in the area of residential mortgage related securities was a major disappointment. We've learned important lessons from that experience and we've made changes to our business. Today, S&P is a very different place than it was two years ago".

Analysts say markets are concerned about proposed changes to the liability rules that could make raters less likely to rate risky companies, thus limiting their business. Says Sharma: "The great danger to us is that any time there's a rating change somebody can sue us - even if the business environment or the economic environment has changed or the business is doing something different."

The \$50 billion decision

Spring 2012

When Ben Graham Asked Me to Replace Him At His Famous Fund, I Faced An Agonizing Choice: Assume The Mantle Of My Hero -- Or Go My Own Way

Benjamin Graham had been my idol ever since I read his book *The Intelligent Investor*. I had wanted to go to Columbia Business School because he was a professor there, and after I got out of Columbia, returned to Omaha, and started selling securities, I didn't forget about him. Between 1951 and 1954, I made a pest of myself, sending him frequent securities ideas. Then I got a letter back: "Next time you're in New York, come and see me."

So there I went, and he offered me a job at Graham-Newman Corp., which he ran with Jerry Newman. Everyone says that A.W. Jones started the hedge fund industry, but Graham-Newman's sister partnership, Newman and Graham, was actually an earlier fund. I moved to White Plains, New York, with my wife, Susie, who was four months pregnant, and my daughter. Every morning, I got on a train to Grand Central and went to work.

It was a short-lived position: The next year, when I was 25, Mr. Graham -- that's what I called him then -- gave me a heads-up that he was going to retire. Actually, he did more than that: He offered me the chance to replace him, with Jerry's son Mickey as the new senior partner and me as the new junior partner. It was a very tiny fund -- \$6 million or \$7 million -- but it was a famous fund.

This was a traumatic decision. Here was my chance to step into the shoes of my hero -- I even named my first son Howard Graham Buffett. (Howard was for my father.) But I also wanted to come back to Omaha. I probably went to work for a month thinking every morning that I would tell Mr. Graham I was going to leave. But it was hard to do.

The thing is, when I got out of college, I had \$9,800, but by the end of 1955, I was up to \$127,000. I thought, I'll go back to Omaha, take some college classes, and read a lot -- I was going to retire! I figured we could live on \$12,000 a year, and off my \$127,000 asset base, I could easily make that. I told my wife, "Compound interest guarantees I'm going to get rich."

My wife and kids went back to Omaha just ahead of me. I got in the car, and on my way west checked out companies I was interested in investing in. It was due diligence. I stopped in Hazleton, Pennsylvania, to visit the Jeddo-Highland Coal Company. I visited the Kalamazoo Stove & Furnace Company in Michigan, which was being liquidated. I went to see what the building looked like, what they had for sale. I went to Delaware, Ohio, to check out Greif Bros. Cooperage. (Who knows anything about cooperage anymore?) Its chairman met with me. I didn't have appointments; I would just drop in. I found that people always talked to me. All these people helped me.

In Omaha, I rented a house at 5202 Underwood for \$175 a month. I told my wife, "I'd be glad to buy a house, but that's like a carpenter selling his toolkit." I didn't want to use up my capital.

I had no plans to start a partnership, or even have a job. I had no worries as long as I could operate on my own. I certainly did not want to sell securities to other people again. But by pure accident, seven people, including a few of my relatives, said to me, "You used to sell stocks, and we want you to tell us what to do with our money." I replied, "I'm not going to do that again, but I'll form a partnership like Ben and Jerry had, and if you want to join me, you can." My father-in-law, my college roommate, his mother, my

[More Compilations](#)

aunt Alice, my sister, my brother-in-law, and my lawyer all signed on. I also had my hundred dollars. That was the beginning -- totally accidental.

When I formed that partnership, we had dinner, the seven of them plus me -- I'm 99 percent sure it was at the Omaha Club. I bought a ledger for 49 cents, and they brought their checks. Before I took their money, I gave them a half sheet of paper that I had made carbons of -- something I called the ground rules. I said, "There are two or four pages of partnership legal documents. Don't worry about that. I'll tell you what's in it, and you won't get any surprises.

"But these ground rules are the philosophy. If you are in tune with me, then let's go. If you aren't, I understand. I'm not going to tell you what we own or anything like that. I want to get bouquets when I deserve bouquets, and I want to get soft fruit thrown at me when I deserve it. But I don't want fruit thrown at me if I'm down 5 percent, and the market's down 15 percent -- I'm going to think I deserve a bouquet for that." We made everything clear, and they gave me their checks.

I did no solicitation, but more checks began coming from people I didn't know. Back in New York, Graham-Newman was being liquidated. There was a college president up in Vermont, Homer Dodge, who had been invested with Graham, and he asked, "Ben, what should I do with my money?" Ben said, "Well, there's this kid who used to work for me. ..." So Dodge drove out to Omaha, to this rented house I lived in. I was 25, looked about 17, and acted like 12. He said, "What are you doing?" I said, "Here's what I'm doing with my family, and I'll do it with you."

Although I had no idea, age 25 was a turning point. I was changing my life, setting up something that would turn into a fairly good-size partnership called Berkshire Hathaway. I wasn't scared. I was doing something I liked, and I'm still doing it. -- As told to Randall Lane. Photographs courtesy of Susie Buffett.

The Genius of America

1/15/2018

The Optimists

I have good news. First, most American children are going to live far better than their parents did. Second, large gains in the living standards of Americans will continue for many generations to come.

Some years back, people generally agreed with my optimism. Today, however, pollsters find that most Americans are pessimistic about their children's future. Politicians, business leaders and the press constantly tell us that our economic machine is sputtering. Their evidence: GDP growth of only 2% or so in recent years.

Before we shed tears over that figure, let's do a little math, recognizing that GDP per capita is what counts. If, for example, the U.S. population were to grow 3% annually while GDP grew 2%, prospects would indeed be bleak for our children.

But that's not the case. We can be confident that births minus deaths will add no more than 0.5% yearly to America's population. Immigration is more difficult to predict. I believe 1 million people annually is a reasonable estimate, an influx that will add 0.3% annually to population growth.

In total, therefore, you can expect America's population to increase about 0.8% a year. Under that assumption, gains of 2% in real GDP—that is, without nominal gains produced by inflation—will annually deliver 1.2% growth in per capita GDP.

This pace no doubt sounds paltry. But over time, it works wonders. In 25 years—a single generation—1.2% annual growth boosts our current \$59,000 of GDP per capita to \$79,000. This \$20,000 increase guarantees a far better life for our children.

In America, it should be noted, there's nothing unusual about that sort of gain, magnificent though it will be. Just look at what has happened in my lifetime.

I was born in 1930, when the symbol of American wealth was John D. Rockefeller Sr. Today my upper-middle-class neighbors enjoy options in travel, entertainment, medicine and education that were simply not available to Rockefeller and his family. With all of his riches, John D. couldn't buy the pleasures and conveniences we now take for granted.

Two words explain this miracle: innovation and productivity. Conversely, were today's Americans doing the same things in the same ways as they did in 1776, we would be leading the same sort of lives as our forebears.

Replicating those early days would require that 80% or so of today's workers be employed on farms simply to provide the food and cotton we need. So why does it take only 2% of today's workers to do this job? Give the credit to those who brought us tractors, planters, cotton gins, combines, fertilizer, irrigation and a host of other productivity improvements.

To all this good news there is, of course, an important offset: in our 241 years, the progress that I've described has disrupted and displaced almost all of our country's labor force. If that level of upheaval had been foreseen—which it clearly wasn't—strong worker opposition would surely have formed and possibly doomed innovation. How, Americans would have asked, could all these unemployed farmers find work?

[More Compilations](#)

We know today that the staggering productivity gains in farming were a blessing. They freed nearly 80% of the nation's workforce to redeploy their efforts into new industries that have changed our way of life.

You can describe these developments as productivity gains or disruptions. Whatever the label, they explain why we now have our amazing \$59,000 of GDP per capita.

This game of economic miracles is in its early innings. Americans will benefit from far more and better "stuff" in the future. The challenge will be to have this bounty deliver a better life to the disrupted as well as to the disrupters. And on this matter, many Americans are justifiably worried.

Let's think again about 1930. Imagine someone then predicting that real per capita GDP would increase sixfold during my lifetime. My parents would have immediately dismissed such a gain as impossible. If somehow, though, they could have imagined it actually transpiring, they would concurrently have predicted something close to universal prosperity.

Instead, another invention of the ensuing decades, the Forbes 400, paints a far different picture. Between the first computation in 1982 and today, the wealth of the 400 increased 29-fold—from \$93 billion to \$2.7 trillion—while many millions of hardworking citizens remained stuck on an economic treadmill. During this period, the tsunami of wealth didn't trickle down. It surged upward.

In 1776, America set off to unleash human potential by combining market economics, the rule of law and equality of opportunity. This foundation was an act of genius that in only 241 years converted our original villages and prairies into \$96 trillion of wealth.

The market system, however, has also left many people hopelessly behind, particularly as it has become ever more specialized. These devastating side effects can be ameliorated: a rich family takes care of all its children, not just those with talents valued by the marketplace.

In the years of growth that certainly lie ahead, I have no doubt that America can both deliver riches to many and a decent life to all. We must not settle for less.

To the Hilton Head Group

Dear Gang,

Normally, when you get a letter from the wife, partner or secretary of Joe Glutz saying, "Of course, Joe is too modest to tell you about this himself, but I know you would want to hear that...", it means that Joe is standing over the writer with a gun at his head, telling him not to look up from the xerox machine until the mailing has been completed.

This one is for real.

Today I received the 1975 annual letter of Walter J. Schloss Associates, which included a twenty-year compilation of Walter's record since he left Graham-Newman. You may remember that I went to work for Graham-Newman in 1954. Walter left in 1955. And then Graham-Newman closed up in 1956. I would prefer not to dwell on the implications of this sequence.

In any event, armed only with a monthly stock guide, a sophisticated style acquired largely from association with me, a sub-lease on a portion of a closet at Tweedy, Browne and a group of partners whose names were straight from a roll call at Ellis Island, Walter strode forth to do battle with the S & P.

On the following page is a re-cap of his yearly performance and calculations I have made regarding compounded results. The difference between the gross results and the limited partners' results is accounted for by the fact that, as General Partner, he takes 25% of the profits - a quaint and easy-to-calculate method of tribute not entirely foreign to many of you.

Walter has had five down years compared to seven for the S & P. His superiority in such down years would indicate that not only is he a man for all seasons, but that he has special strength when facing a head wind. Maybe all of you had better watch Ben Graham on Wall Street Week this Friday.

As for me, I'm going right out and buy some Hudson Pulp & Paper.

Best,

WEB/glk

TELEPHONE 402, 346-1400

April 15, 1994

To the Lantana Group:

Eighteen years ago, I sent you the attached memo that recounted the results Walter Schloss had achieved since starting his partnership in 1955.

The other day I received Walter's 1993 tabulation which is also attached. Accompanying these performance figures is a financial statement that should inspire Ben Graham Productions to film Citizen Schloss. Please note that Walter's total office expense is about \$11,000 as compared to net income of \$19 million. Fixed assets are carried at \$2,605 (000's not omitted), but Walter would like me to mention that the cost was \$6,569 new.

I think Walter's operational style should be a lesson for us all (one Charlie has already mastered). In effect, Walter is running his office for a year on what it costs Berkshire to start the engines on The Indefensible.

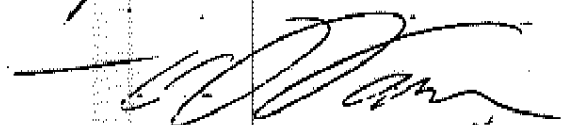

Meanwhile, Walter continues to outperform managers who work in temples filled with paintings, staff and computers. And he accomplishes this feat by rummaging among the cigar butts on the floor of capitalism: It's quite a 38-year record, a tribute to Ben as a teacher, Walter as a student, and to the advantage of a free puff.

Best regards,

Warren E. Buffett

Is the Graham and Dodd “look for values with a significant margin of safety relative to prices” approach to security analysis out of date? Many of the professors who write textbooks today say “yes.” They argue that the stock market is efficient; that is, that stock prices reflect everything that is known about a company’s prospects and about the state of the economy. There are no undervalued stocks, these theorists argue, because there are smart security analysts who utilize all available information to insure unfailingly appropriate prices. Investors who seem to “beat the market” year after year are just lucky. “If prices fully reflect available information, this sort of investment adeptness is ruled out,” writes one of today’s textbook authors.

Well, maybe. But I want to present to you a group of investors who have, year in and year out, beaten the Standard & Poor’s 500 stock index. The hypothesis that they do this by pure chance is at least worth examining. Crucial to this examination is the fact that these winners were all well known to me and pre-identified as superior investors, the most recent identification occurring over 15 years ago. Absent this condition—that is, if I had just recently searched

The Superinvestors of Graham-and-Doddsville

By Warren E. Buffett

“Superinvestor” Warren E. Buffett, who got an A+ from Ben Graham at Columbia in 1951, never stopped making the grade. He made his fortune using the principles of Graham & Dodd’s Security Analysis. Here, in celebration of the fiftieth anniversary of that classic text, he tracks the records of investors who stick to the “value approach” and have gotten rich going by the book.

among thousands of records to select a few names for you this morning—I would advise you to stop reading right here. I should add that all of these records have been audited. And I should further add that I have known many of those who have invested with these managers, and the checks received by those participants over the years have matched the stated records.

Before we begin this examination, I would like you to imagine a national coin-flipping contest. Let's assume we get 225 million Americans up tomorrow morning and we ask them all to wager a dollar. They go out in the morning at sunrise, and they all call the flip of a coin. If they call correctly, they win a dollar from those who called wrong. Each day the losers drop out, and on the subsequent day the stakes build as all previous winnings are put on the line. After ten flips on ten mornings, there will be approximately 220,000 people in the United States who have correctly called ten flips in a row. They each will have won a little over \$1,000.

Now this group will probably start getting a little puffed up about this, human nature being what it is. They may try to be modest, but at cocktail parties they will occasionally admit to attractive members of

the opposite sex what their technique is, and what marvelous insights they bring to the field of flipping.

Assuming that the winners are getting the appropriate rewards from the losers, in another ten days we will have 215 people who have successfully called their coin flips 20 times in a row and who, by this exercise, each have turned one dollar into a little over \$1 million. \$225 million would have been lost, \$225 million would have been won.

By then, this group will really lose their heads. They will probably write books on "How I Turned a Dollar into a Million in Twenty Days Working Thirty Seconds a Morning." Worse yet, they'll probably start jetting around the country attending seminars on efficient coin-flipping and tackling skeptical professors with, "If it can't be done, why are there 215 of us?"

But then some business school professor will probably be rude enough to bring up the fact that if 225 million orangutans had engaged in a similar exercise, the results would be much the same—215 egotistical orangutans with 20 straight winning flips.

I would argue, however, that there *are* some important differences in the examples I am going to present. For one thing, if (a) you had taken 225 million

The New York Times

The late Benjamin Graham (left) and David L. Dodd wrote Security Analysis in 1934. The book, still in print, went to four editions, and has become an invaluable investment management tool.

Leslie Jean-Bart

David L. Dodd was awarded an honorary doctorate from Columbia University in May 1984, in recognition of the lasting intellectual achievement of the book. Dodd, professor emeritus at Columbia, lives in Maine.

orangutans distributed roughly as the U.S. population is; if (b) 215 winners were left after 20 days; and if (c) you found that 40 came from a particular zoo in Omaha, you would be pretty sure you were on to something. So you would probably go out and ask the zookeeper about what he's feeding them, whether they had special exercises, what books they read, and who knows what else. That is, if you found any really extraordinary concentrations of success, you might want to see if you could identify concentrations of unusual characteristics that might be causal factors.

Scientific inquiry naturally follows such a pattern. If you were trying to analyze possible causes of a rare type of cancer—with, say, 1,500 cases a year in the United States—and you found that 400 of them occurred in some little mining town in Montana, you would get very interested in the water there, or the occupation of those afflicted, or other variables. You know that it's not random chance that 400 come from a small area. You would not necessarily know the causal factors, but you would know where to search.

I submit to you that there are ways of defining an

origin other than geography. In addition to geographical origins, there can be what I call an *intellectual* origin. I think you will find that a disproportionate number of successful coin-flippers in the investment world came from a very small intellectual village that could be called Graham-and-Doddsville. A concentration of winners that simply cannot be explained by chance can be traced to this particular intellectual village.

Conditions could exist that would make even that concentration unimportant. Perhaps 100 people were simply imitating the coin-flipping call of some terribly persuasive personality. When he called heads, 100 followers automatically called that coin the same way. If the leader was part of the 215 left at the end, the fact that 100 came from the same intellectual origin would mean nothing. You would simply be identifying one case as a hundred cases. Similarly, let's assume that you lived in a strongly patriarchal society and every family in the United States conveniently consisted of ten members. Further assume that the patriarchal culture was so strong that, when the 225 million people went out the first day, every member of the family identified with the father's call. Now, at the end of the

20-day period, you would have 215 winners, and you would find that they came from only 21.5 families. Some naive types might say that this indicates an enormous hereditary factor as an explanation of successful coin-flipping. But, of course, it would have no significance at all because it would simply mean that you didn't have 215 individual winners, but rather 21.5 randomly-distributed families who were winners.

In this group of successful investors that I want to consider, there has been a common intellectual patriarch, Ben Graham. But the children who left the house of this intellectual patriarch have called their "flips" in very different ways. They have gone to different places and bought and sold different stocks and companies, yet they have had a combined record that simply can't be explained by random chance. It certainly cannot be explained by the fact that they are all calling flips identically because a leader is signaling the calls to make. The patriarch has merely set forth the intellectual theory for making coin-calling decisions, but each student has decided on his own manner of applying the theory.

The common intellectual theme of the investors

from Graham-and-Doddsville is this: they search for discrepancies between the *value* of a business and the *price* of small pieces of that business in the market. Essentially, they exploit those discrepancies without the efficient market theorist's concern as to whether the stocks are bought on Monday or Thursday, or whether it is January or July, etc. Incidentally, when businessmen buy businesses—which is just what our Graham & Dodd investors are doing through the medium of marketable stocks—I doubt that many are cranking into their purchase decision the day of the week or the month in which the transaction is going to occur. If it doesn't make any difference whether all of a business is being bought on a Monday or a Friday, I am baffled why academicians invest extensive time and effort to see whether it makes a difference when buying small pieces of those same businesses. Our Graham & Dodd investors, needless to say, do not discuss beta, the capital asset pricing model or covariance in returns among securities. These are not subjects of any interest to them. In fact, most of them would have difficulty defining those terms. The investors simply focus on two variables: price and value.

I always find it extraordinary that so many studies

are made of price and volume behavior, the stuff of chartists. Can you imagine buying an entire business simply because the price of the business had been marked *up* substantially last week and the week before? Of course, the reason a lot of studies are made of these price and volume variables is that now, in the age of computers, there are almost endless data available about them. It isn't necessarily because such studies have any utility; it's simply that the data are there and academicians have worked hard to learn the mathematical skills needed to manipulate them. Once these skills are acquired, it seems sinful not to use them, even if the usage has no utility or negative utility. As a friend said, to a man with a hammer, everything looks like a nail.

I think the group that we have identified by a common intellectual home is worthy of study. Incidentally, despite all the academic studies of the influence of such variables as price, volume, seasonality, capitalization size, etc., upon stock performance, no interest has been evidenced in studying the methods of this unusual concentration of value-oriented winners.

I begin this study of results by going back to a group of four of us who worked at Graham-Newman Corporation from 1954 through 1956. There

were only four—I have not selected these names from among thousands. I offered to go to work at Graham-Newman for nothing after I took Ben Graham's class, but he turned me down as overvalued. He took this value stuff very seriously! After much pestering he finally hired me. There were three partners and four of us at the "peasant" level. All four left between 1955 and 1957 when the firm was wound up, and it's possible to trace the record of three.

The first example (Table 1) is that of Walter Schloss. Walter never went to college, but took a course from Ben Graham at night at the New York Institute of Finance. Walter left Graham-Newman in 1955 and achieved the record shown here over 28 years.

Here is what 'Adam Smith'—after I told him about Walter—wrote about him in *Supermoney* (1972):

He has no connections or access to useful information. Practically no one in Wall Street knows him and he is not fed any ideas. He looks up the numbers in the manuals and sends for the annual reports, and that's about it.

In introducing me to [Schloss] Warren had also, to

Table 4 • Sequoia Fund, Inc.

Year	Annual Percentage Change**	
	Sequoia Fund (%)	S&P 500 Index* (%)

*Includes dividends (and capital gains distributions in the case of Sequoia Fund) treated as though reinvested.

**These figures differ slightly from the S&P figures in Table 1 because of a difference in calculation of reinvested dividends.

my mind, described himself. 'He never forgets that he is handling other people's money and this reinforces his normal strong aversion to loss. He has total integrity and a realistic picture of himself. Money is real to him and stocks are real—and from this flows an attraction to the 'margin of safety' principle.

Walter has diversified enormously, owning well over 100 stocks currently. He knows how to identify securities that sell at considerably less than their value to a private owner. *And that's all he does.* He doesn't worry about whether it's January, he doesn't worry about whether it's Monday, he doesn't worry about whether it's an election year. He simply says, if a business is worth a dollar and I can buy it for 40 cents, something good may happen to me. And he does it over and over and over again. He owns many more stocks than I do—and is far less interested in the underlying nature of the business; I don't seem to have very much influence on Walter. That's one of his strengths; no one has much influence on him.

The second case is Tom Knapp who also worked at Graham-Newman with me. Tom was a chemistry major at Princeton before the war; when he came back from the war, he was a beach bum. And then one day

he read that Dave Dodd was giving a night course in investments at Columbia. Tom took it on a non-credit basis, and he got so interested in the subject from taking that course that he came up and enrolled at Columbia Business School where he got the MBA degree. He took Dodd's course again, and took Ben Graham's course. Incidentally, 35 years later I called Tom to ascertain some of the facts involved here and I found him on the beach again. The only difference is that now he owns the beach!

In 1968 Tom Knapp and Ed Anderson, also a Graham disciple, along with one or two other fellows of similar persuasion, formed Tweedy, Browne Partners, and their investment results appear in Table 2. Tweedy, Browne built that record with very wide diversification. They occasionally bought control of businesses, but the record of the passive investments is equal to the record of the control investments.

Table 3 describes the third member of the group who formed Buffett Partnership in 1957. The best thing he did was to quit in 1969. Since then, in a sense, Berkshire Hathaway has been a continuation of the partnership in some respects. There is no single index I can give you that I would feel would

be a fair test of investment management at Berkshire. But I think that any way you figure it, it has been satisfactory.

Table 4 shows the record of the Sequoia Fund, which is managed by a man whom I met in 1951 in Ben Graham's class. Bill Ruane. After getting out of Harvard Business School, he went to Wall Street. Then he realized that he needed to get a real business education so he came up to take Ben's course at Columbia, where we met in early 1951. Bill's record from 1951 to 1970, working with relatively small sums, was far better than average. When I wound up Buffett Partnership I asked Bill if he would set up a fund to handle all of our partners so he set up the Sequoia Fund. He set it up at a terrible time, just when I was quitting. He went right into the two-tier market and all the difficulties that made for comparative performance for value-oriented investors. I am happy to say that my partners, to an amazing degree, not only stayed with him but added money, with the happy result shown.

There's no hindsight involved here. Bill was the only person I recommended to my partners, and I said at the time that if he achieved a four point per annum advantage over the Standard & Poor's, that would be

solid performance. Bill has achieved well over that, working with progressively larger sums of money. That makes things much more difficult. Size is the anchor of performance. There is no question about it. It doesn't mean you can't do better than average when you get larger, but the margin shrinks. And if you ever get so you're managing two trillion dollars, and that happens to be the amount of the total equity evaluation in the economy, don't think that you'll do better than average!

I should add that, in the records we've looked at so far, throughout this whole period there was practically no duplication in these portfolios. These are men who select securities based on discrepancies between price and value, but they make their selections very differently. Walter's largest holdings have been such stalwarts as Hudson Pulp & Paper and Jeddo Highland Coal and New York Trap Rock Company and all those other names that come instantly to mind to even a casual reader of the business pages. Tweedy Browne's selections have sunk even well below that level in terms of name recognition. On the other hand, Bill has worked with big companies. The overlap among these portfolios has been very, very low.

These records do not reflect one guy calling the flip and fifty people yelling out the same thing after him.

Table 5 is the record of a friend of mine who is a Harvard Law graduate, who set up a major law firm. I ran into him in about 1960 and told him that law was fine as a hobby but he could do better. He set up a partnership quite the opposite of Walter's. His portfolio was concentrated in very few securities and therefore, his record was much more volatile but it was based on the same discount-from-value approach. He was willing to accept greater peaks and valleys of performance, and he happens to be a fellow whose whole psyche goes toward concentration, with the results shown. Incidentally, this record belongs to Charlie Munger, my partner for a long time in the operation of Berkshire Hathaway. When he ran his partnership, however, his portfolio holdings were almost completely different from mine and the other fellows mentioned earlier.

Table 6 is the record of a fellow who was a pal of Charlie Munger's—another non-business school type—who was a math major at USC. He went to work for IBM after graduation and was an IBM sales-

man for a while. After I got to Charlie, Charlie got to him. This happens to be the record of Rick Guerin. Rick, from 1965 to 1983, against a compounded gain of 316 percent for the S&P, came off with 22,200 percent which, probably because he lacks a business school education, he regards as statistically significant.

One sidelight here: it is extraordinary to me that the idea of buying dollar bills for 40 cents takes immediately with people or it doesn't take at all. It's like an inoculation. If it doesn't grab a person right away, I find that you can talk to him for years and show him records, and it doesn't make any difference. They just don't seem able to grasp the concept, simple as it is. A fellow like Rick Guerin, who had no formal education in business, understands immediately the value approach to investing and he's applying it five minutes later. I've never seen anyone who became a gradual convert over a ten-year period to this approach. It doesn't seem to be a matter of I.Q. or academic training. It's instant recognition, or it is nothing.

Table 7 is the record of Stan Perlmeter. Stan was a liberal arts major at the University of Michigan who was a partner in the advertising agency of Bozell & Jacobs. We happened to be in the same building in

Omaha. In 1965 he figured out I had a better business than he did, so he left advertising. Again, it took five minutes for Stan to embrace the value approach.

Perlmeter does not own what Walter Schloss owns. He does not own what Bill Ruane owns. These are records made *independently*. But every time Perlmeter buys a stock it's because he's getting more for his money than he's paying. That's the only thing he's thinking about. He's not looking at quarterly earnings projections, he's not looking at next year's earnings, he's not thinking about what day of the week it is, he doesn't care what investment research from any place says, he's not interested in price momentum, volume or anything. He's simply asking: What is the business worth?

Table 8 and Table 9 are the records of two pension funds I've been involved in. They are not selected from dozens of pension funds with which I have had involvement; they are the only two I have influenced. In both cases I have steered them toward value-oriented managers. Very, very few pension funds are managed from a value standpoint. Table 8 is the Washington Post Company's Pension Fund. It was with a large bank some years ago, and I

suggested that they would do well to select managers who had a value orientation.

As you can see, overall they have been in the top percentile ever since they made the change. The Post told the managers to keep at least 25 percent of these funds in bonds, which would not have been necessarily the choice of these managers. So, I've included the bond performance simply to illustrate that this group has no particular expertise about bonds. They wouldn't have said they did. Even with this drag of 25 percent of their fund in an area that was not their game, they were in the top percentile of fund management. The Washington Post experience does not cover a terribly long period but it does represent many investment decisions by three managers who were not identified retroactively.

Table 9 is the record of the FMC Corporation fund. I don't manage a dime of it myself but I did, in 1974, influence their decision to select value-oriented managers. Prior to that time they had selected managers much the same way as most larger companies. They now rank number one in the Becker survey of pension funds for their size over the period of time subsequent to this "conversion" to the value approach. Last year they had eight equity managers of any duration

11/1/82-10/31/83	22.2	18.4		

beyond a year. Seven of them had a cumulative record better than the S&P. All eight had a better record last year than the S&P. The net difference now between a median performance and the actual performance of the FMC fund over this period is \$243 million. FMC attributes this to the mindset given to them about the selection of managers. Those managers are not the managers I would necessarily select but they all have the common denominator of selecting securities based on value.

So these are nine records of "coin-flippers" from Graham-and-Doddsville. I haven't selected them with hindsight from among thousands. It's not like I am reciting to you the names of a bunch of lottery winners—people I had never heard of before they won the lottery. I selected these men years ago based upon their framework for investment decision-making. I knew what they had been taught and additionally, I had some personal knowledge of their intellect, character and temperament. It's very important to understand that this group has assumed far less risk than average; note their record in years when the general market was weak. While they differ greatly in style, these investors are, mentally, always *buying the business, not buying the stock*. A few of them sometimes

buy whole businesses, far more often they simply buy small pieces of businesses. Their attitude, whether buying all or a tiny piece of a business, is the same. Some of them hold portfolios with dozens of stocks; others concentrate on a handful. But all exploit the difference between the market price of a business and its intrinsic value.

I'm convinced that there is much inefficiency in the market. These Graham-and-Doddsville investors have successfully exploited gaps between price and value. When the price of a stock can be influenced by a "herd" on Wall Street with prices set at the margin by the most emotional person, or the greediest person, or the most depressed person, it is hard to argue that the market always prices rationally. In fact, market prices are frequently nonsensical.

I would like to say one important thing about risk and reward. Sometimes risk and reward are correlated in a positive fashion. If someone were to say to me, "I have here a six-shooter and I have slipped one cartridge into it. Why don't you just spin it and pull it once? If you survive, I will give you \$1 million." I would decline—perhaps stating that \$1 million is not enough. Then he might offer me \$5 million to

*Annualized

Rank indicates the fund's performance against the A.C. Becker universe. Rank is stated as a percentile; 1 = best performance, 100 = worst.

pull the trigger twice—now that would be a positive correlation between risk and reward!

The exact opposite is true with value investing. If you buy a dollar bill for 60 cents, it's riskier than if you buy a dollar bill for 40 cents, but the expectation of reward is greater in the latter case. The greater the potential for reward in the value portfolio, the less risk there is.

One quick example: The Washington Post Company in 1973 was selling for \$80 million in the market. At the time, that day, you could have sold the assets to any one of ten buyers for not less than \$400 million, probably appreciably more. The company owned the *Post*, *Newsweek*, plus several television stations in major markets. Those same properties are worth \$2 billion now so the person who would have paid \$400 million would not have been crazy.

Now, if the stock had declined even further to a price that made the valuation \$40 million instead of \$80 million, its beta would have been greater. And to people who think beta measures risk, the cheaper price would have made it look riskier. This is truly Alice in Wonderland. I have never been able to figure out why it's riskier to buy \$400 million worth of prop-

erties for \$40 million than \$80 million. And, as a matter of fact, if you buy a group of such securities and you know anything at all about business valuation, there is essentially no risk in buying \$400 million for \$80 million, particularly if you do it by buying ten \$40 million piles for \$8 million each. Since you don't have your hands on the \$400 million, you want to be sure you are in with honest and reasonably competent people, but that's not a difficult job.

You also have to have the knowledge to enable you to make a very general estimate about the value of the underlying businesses. But you do not cut it close. That is what Ben Graham meant by having a margin of safety. You don't try and buy businesses worth \$83 million for \$80 million. You leave yourself an enormous margin. When you build a bridge, you insist it can carry 30,000 pounds, but you only drive 10,000-pound trucks across it. And that same principle works in investing.

In conclusion, some of the more commercially minded among you may wonder why I am writing this article. Adding many converts to the value approach will perforce narrow the spreads between price and value. I can only tell you that the secret has been out

for 50 years, ever since Ben Graham and Dave Dodd wrote *Security Analysis*, yet I have seen no trend toward value investing in the 35 years I've practiced it. There seems to be some perverse human characteristic that likes to make easy things difficult. The academic world, if anything, has actually backed away from the teaching of value investing over the last 30 years. It's likely to continue that way. Ships will sail around the world but the Flat Earth Society will flourish. There will continue to be wide discrepancies between price and value in the marketplace, and those who read their Graham & Dodd will continue to prosper. 4

on a speech he gave at Columbia Business School, May 17, 1984 at a seminar marking the 50th anniversary of the publication of Benjamin Graham and David Dodd's Security Analysis.

Warren E. Buffett, is chairman and chief executive officer of Berkshire Hathaway, Inc., an Omaha-based insurer with major holdings in several other industries, including General Foods, Xerox and Washington Post Company.

After getting an A+ in Benjamin Graham's class and graduating from Columbia Business School in 1951, Buffett went to work on Wall Street at Graham-Newman & Company. In 1957 founded his own partnership, which he ran for ten years. This article is based

Subject: Go Huskers!

Date: Sunday, August 17, 1997 9:37 PM

Warren, I apologize in advance for this being a long note. I do hope you find it interesting, and be certain I don't expect a long reply (or any reply at all for that matter). Perhaps sometime we'll get a few minutes where I can get your reaction to the thoughts on business below.

Go Huskers!

We're looking forward to seeing you in a few weeks for the Husker game. Please let me know if there is anything I can do to make your stay in Washington more enjoyable (and a list more Husker-oriented!), and I will also check in with BillG on the plans and how I might help.

I'm sad to say I'm very pessimistic about our prospects. You've probably noted that Washington is very highly ranked this year. They have Huard, arguably one of the top 2 or 3 pro-style quarterbacks in the country – and only a sophomore. And they have an outstanding defense. In the meantime, the Huskers are replacing eight starters on defense, and the spring game showed that Frost still can't throw the ball well enough. Without a balanced attack on offense, we'll have difficulty against their speed. And Huard has the potential to pick apart our secondary – we'll need an outstanding plan on pass rush, equivalent to the "Philadelphia Blitz" employed at the Nebraska vs. Florida Fiesta Bowl championship game.

I hope you're hearing better news from fall practice. People here know I'm a huge Husker fan – I can't tell you how painful it would be for me to go through two more losses to the Huskies.

The Making of An American Capitalist...

Tricia and I took the kids to Disney World, followed by a short vacation to Nantucket and Cutthunk (a small island off Martha's Vineyard). I spent part of the vacation reading Lowenstein's book (The Making of an American Capitalist) – and really enjoyed it! On the way from Cutthunk to Boston/Logan airport, we drove down Cove Road in New Bedford trying to find the BBerkshire-Hathaway mill. While I saw a few old mills, I'm not really sure which might have been the one – I was looking for the clock tower. Or perhaps it has been torn down.

The book got me thinking about your golf tournament, the after-dinner "Talk with Warren", and the inevitable question – why don't you invest in Microsoft or high technology? The Lowenstein book provided some stimulus to ponder the question, and I thought it would be fun to share some thoughts with you on the subject. But I should emphasize my intent in doing so is not to try to change your viewpoint (though I hope it doesn't reinforce your view!). I just view this as a fun discussion or intellectual exercise. While many people would see our business as complicated or hard to understand, I am absolutely convinced an astute investor can learn our business in only 3 to 4 hours (and probably less than two hours if BillG explained it!).

In some respects I see the business characteristics of Coca Cola or See's Candy as being very similar to Microsoft. I think you would love the simplicity of the operating system business. E.g. in FY96 there were 50 million PC's sold in the world, and about 80% of them were licensed for a microsoft operating system. Although I would never write down the analogy of a "toll bridge", people outside our company might describe this business in that way. Those 40 million licenses averaged about \$45 per, for a total

about \$1.8B in revenue. By the way, the remaining 10M PC's were largely running Microsoft operating systems – we just didn't get paid for them. This problem – piracy – if reduced, is one of the key upsides to our business.

In FY2000, there will be about 100M PC's sold. We think we can reduce piracy to 10% and license 90% or 90M of the PC's. But we also have “pricing discretion” – I think I heard this term used in conjunction with your pricing decisions on See's Candy. We will be transitioning the world to a new version of our operating system, Windows NT. Today, we get more than \$100 per system for NT, but only on a small percentage of the PC's. But NT will be on closer to 70% of the PC's sold in FY2000. We can achieve average license revenue of \$80. So 90M licenses at \$80 per license totals about \$7.2B, up from just under \$2B in 3 to 4 years. And since there are effectively no COGs and a WW sales force of only 100-150 people this is a 90%+ margin business. There is an R&D charge to the business, but I'm sure the profits are probably as good as the syrup business!

There is actually upside in the number of PC's sold. Similar to your analysis of Coca Cola, the penetration of PC's in international markets leaves a lot of room for growth. In the US, the number of PC's per 1000 people is around 400 or so, but the number drops off rapidly to 100 or less in most countries, even in some of the European countries. (Unfortunately, I'm not in Seattle now so I don't have these numbers at my fingertips, but Steve Ballmer can recite them from memory.)

The business described above is what we call the OEM (Original Equipment Manufacturer) business, meaning our revenue comes from the manufacturers of the PC's. The majority of the rest of the business is called the “finished goods” business. It consists of businesses or individuals buying office productivity software, educational or entertainment software, etc. Again the structure is very simple. A PC is just a razor that needs blades, and we measure our revenue on the basis of \$ per PC. In FY96, nearly 50M PC's were purchased and Microsoft averaged about \$140 in software revenue per PC or \$7B. This amount is in addition to the OEM royalty business I described above. (Steve Ballmer can recite the number of PC's and \$ per PC to you off the top of his head for just about any country in the world; BillG can probably do the same though he doesn't spend as much time on that as Steve.)

So in some sense that is it. There are a certain number of PC's that get sold, a growing amount of Microsoft software per PC, the power to use the brand to sell even more software, some pricing discretion, international market growth, and the opportunity to grow revenue by further reduction in piracy. Obviously I'm not going through all the details we'd discuss in a couple hour session, but that is the heart of the business. Of course there is the R&D invested to build the software, but that is similar to Disney continuing to produce new content, or Nebraska Furniture Mart continuing to produce new content, or Nebraska Furniture Mart continuing to keep their format fresh, and an investment that BillG manages very closely.

Even some of the new “media” businesses are really not that new or different. Take our WebTV acquisition or the Comcast deal. I see articles covering those investments and describing Microsoft as becoming a media company. The real goal is to figure out a way to get an “operating system” royalty per TV. 10's of millions of TV's per year at \$10-20 per TV is a nice little “operating system” business.

There is a tremendous strategic synergy between the “finished goods business” and the OEM operating system business. E.g. we have about 90% share of office productivity software with Microsoft Office, and that is a great business (about \$5B, also 85%+ operating margin). But also important is the fact that this software is heavily valued by the actual users (operating systems are a bit more invisible to the user), and they resist shifting brands. If we own the key “franchises” built on top of the operating system, we dramatically widen the “moat” that protects the operating system business. I.e. if I owned the most

successful daily newspaper in Buffalo, I wouldn't want to leave it to my competitor to own the Sunday edition.

Let's build on this analogy and the strategic synergy between the operating system and the software that runs on it. It helps explain the investments we are making in Pete Higgins business (Interactive Media, like MSN, MSNBC, Expedia, Sidewalk, etc.). Again, some newspaper and magazine articles would say that Microsoft is trying to become a media company. But I prefer to view it as investing in the potential "user franchises" that will help protect our operating systems business in the future. We hope to make a lot of money off these franchises, but even more important is that they should protect our Windows royalty per PC, and hopefully our royalty per TV. And success in those businesses will help increase the opportunity for future pricing discretion.

So I really don't see our business as being significantly more difficult to understand than the other great businesses you've invested in. But there is one potential difference that worries me, and it is a key part of the reason I spent the time to share these thoughts with you. The difference I worry about is the "width of the moat." With Coca Cola, you can feel pretty confident that there won't be a fast shift in user preferences away from drinking sodas, and in particular Coke. In technology, we may more frequently see "paradigm shifts" where old leaders are displaced by new. Graphical user interface replaces character user interface, the Internet explodes, etc.

In the absence of a paradigm shift in technology, market shares seldom change by more than a few points. With a paradigm shift, the shares can rapidly change by dozens of points. I spent my first ten years at Microsoft building Microsoft Office. We were way behind in share most of that time (less than 10%), but the shift to graphical user interface was the paradigm shift that allowed us to displace the old leaders (Lotus 1-2-3 and WordPerfect) and now be at 90% share. Of course key to this shift in share, was their failure to identify the computing paradigm shift and properly invest in it. They were the leaders and they could have chosen to cannibalize themselves. But they didn't act fast enough and were scared that investing in the new paradigm would open the door for us – ironically it was their slow pace that opened the door.

I remember one of our very first conversations in 1991. You asked me my view on what happened to IBM. I don't remember exactly what I said. I think their addiction to the power they had in the previous generations of computing, really blindsided them from the paradigm shift of the PC and client-server computing.

In technology, the moats may be narrower. It is amazing how fast the Internet exploded. Or how quickly Java gained notoriety. We have some great moats, but even so, 18 months ago analysts were questioning whether we could move quickly enough. (Obviously, that turned out to be a great time to buy Microsoft!)

I am very confident about our business for the next 5 to 10 years. But I will admit it is easier to be confident about Coke's business for the next 10 years. In short, I've long had this sneaking suspicion that it is not that you don't understand this business. (In fact, BillG has probably already explained all of the above to you and I apologize for boring you with this, but it was fun and good for me to write it down.) My theory is that you don't invest in technology or Microsoft because you see the moats as narrower; too much risk and the potential for a fast paradigm shift that would too quickly undermine your equity position.

Since Microsoft is the business I understand (i.e. I have a narrow circle of competence!) and I subscribe to your views on investments, well over 90% of my net worth is tied up there. (Thanks to BillG, I'm well into the nine digit range.) I feel fine about having 90%+ tied up in Microsoft. We have a "safety net" of

tax free municipal bonds so I know the family will be OK if something happens. And we don't intend to leave much to the kids, so I'm simply building a huge pile of chits to someday turn back to society. I do wonder about the time period ten or twenty or more years down the road. If at some point then the outlook for Microsoft has changed, I hope I will have learned enough from your approach such that I will have the ability to identify new areas of intrinsic value and continue to grow the pile of chits at a high rate. But for now, I'm heads down selling more software...

I'm curious as to what you think about the Lowenstein book. I'm sure it is difficult to have so much of your life spread across the pages, on the other hand, there are so many things for you to be proud of. It was great to gain an understanding of Graham's approach, and more importantly your significant advancement of the approach. I found the arguments of the EMT (efficient market theoreticians) just laughable. They should spend a few days at Disney World so they can observe crowd theory in action. Believe me, the longest lines don't necessarily translate into the best values! But the best part of the book was to learn more about your values, and in particular the discipline of character that leads to your success in investing. I wish there were a magic formula for teaching this to our children!

This leaves me one final task for this note. I've done a very poor job of adequately thanking you for all the great things you've done for me – golf at Augusta, Seminole, the Buffett Classic, and in particular, the opportunity to listen in on the great conversations and learn from you. I want you to know I've really appreciated your kindness, and if there is every anything I might do to reciprocate, please let me know.

Thanks. Jeff Raikes

Warren Buffett response to Jeff Raikes

Subject: Re: Go Huskers!

Hi Jeff;

I have so few friends who use e-mail that I only look for it once a week or so (and usually find nothing) so excuse the slowness in responding. I am also reasonably fast at typing but poor in the accuracy department and find it easier just to plow ahead rather than correct, knowing i am always writing to those who find a little deciphering an interesting but easy challenge.

I am afraid you have the Husker-Husky situation correctly handicapped. We need a miracle and it's unlikely to happen in a stadium in which Frost will not be able to hear a word he shouts. I hope Osborne has had him working on hand signals all summer.

Your analysis of Microsoft, why I should invest in it, and why I don't could not be more on the money. In effect the company has a royalty on a communication stream that can do nothing but grow. It's as if you were getting paid for every gallon of water starting in a small stream but with added amounts received as tributaries turned the stream into an Amazon. The toughest question is how hard to push prices and I wrote a note to Bill on that after our December meeting last year. Bell should have anticipated Bill and let someone else put in the phone infrastructure while he collected by the minute and distance (and even importance of the call if he could have figured a way to monitor it) in perpetuity.

Coke is now getting a royalty on swallows; probably 7.2 billion a day if these gulp is one ounce. I feel 100% sure (perhaps mistakenly) that I know the odds of this continuing – again 100% as long as cola doesn't cause cancer. Bill has an even better royalty – one which I would never bet against but I don't feel I am capable of assessing probability about, except to the extent that with a gun to my head and forced to make a guess, I would go with it rather than against. But to calibrate whether my certainty is 80% or 55%, say, for a 20-year run would be folly. If I had to make such decisions, I would do my best but I prefer to structure investing as a no-called-strikes game and just wait for the fat one.

I watched Ted Williams on cable the other day and he referred to a book called the science of hitting which I then ran down. It has a drawing of the batters box in it that he had referred to on the show with lots of little squares in it, all parts of the strike zone. In his favorite spot, the box showed .400 reflecting what he felt he would hit if he only swung at pitches in that area. Low and outside, but still in the strike zone, he got down to .260. Of course, if he had two strikes on him, he was going to swing at that .260 pitch but otherwise he waited for one in the "happy zone" as he put it. I think the same approach makes sense in investing. Your happy zone, because of the business experience you have had, what you see every day, your natural talents, etc. is going to be different than mine. I am sure, moreover that you can hit balls better in my happy zone than I can in yours just because they are fatter pitches in general.

Let's talk more about this when we get together. As a beginner I always feel that when I send off any e-mail, it is going to vanish into the ether and i would hate to have that happen with everything i know. GO HUSTKERS — Warren

BERKSHIRE HATHAWAY INC.

AN OWNER'S MANUAL*

A Message from Warren E. Buffett, Chairman and CEO

January 1999

INTRODUCTION

Augmented by the General Re merger, Berkshire's shareholder count has doubled in the past year to about 250,000. Charlie Munger, Berkshire's Vice Chairman and my partner, and I welcome each of you. As a further greeting, we have prepared a second printing of this booklet to help you understand our business, goals, philosophy and limitations.

These pages are aimed at explaining our broad principles of operation, not at giving you detail about Berkshire's many businesses. For more detail and a continuing update on our progress, you should look to our annual reports. We will be happy to send a copy of our 1997 report to any shareholder requesting it. A great deal of additional information, including our 1977-1996 annual letters, is available at our Internet site: www.berkshirehathaway.com.

OWNER-RELATED BUSINESS PRINCIPLES

At the time of the Blue Chip merger in 1983, I set down 13 owner-related business principles that I thought would help new shareholders understand our managerial approach. As is appropriate for "principles," all 13 remain alive and well today, and they are stated here in italics. A few words have been changed to bring them up-to-date and to each I've added a short commentary.

1. *Although our form is corporate, our attitude is partnership. Charlie Munger and I think of our shareholders as owner-partners, and of ourselves as managing partners. (Because of the size of our shareholdings we are also, for better or worse, controlling partners.) We do not view the company itself as the ultimate owner of our business assets but instead view the company as a conduit through which our shareholders own the assets.*

Charlie and I hope that you do not think of yourself as merely owning a piece of paper whose price wiggles around daily and that is a candidate for sale when some economic or political event makes you nervous. We hope you instead visualize yourself as a part owner of a business that you expect to stay with indefinitely, much as you might if you owned a farm or apartment house in partnership with members of your family. For our part, we do not view Berkshire shareholders as faceless members of an ever-shifting crowd, but rather as co-venturers who have entrusted their funds to us for what may well turn out to be the remainder of their lives.

The evidence suggests that most Berkshire shareholders have indeed embraced this long-term partnership concept. The annual percentage turnover in Berkshire's shares is a small fraction of that occurring in the stocks of other major American corporations, even when the shares I own are excluded from the calculation.

In effect, our shareholders behave in respect to their Berkshire stock much as Berkshire itself behaves in respect to companies in which it has an investment. As owners of, say, Coca-Cola or Gillette shares, we think of Berkshire as being a non-managing partner in two extraordinary businesses, in which we measure

our success by the long-term progress of the companies rather than by the month-to-month movements of their stocks. In fact, we would not care in the least if several years went by in which there was no trading, or quotation of prices, in the stocks of those companies. If we have good long-term expectations, short-term price changes are meaningless for us except to the extent they offer us an opportunity to increase our ownership at an attractive price.

- 2. In line with Berkshire's owner-orientation, most of our directors have a major portion of their net worth invested in the company. We eat our own cooking.*

Charlie's family has 90% or more of its net worth in Berkshire shares; my wife, Susie, and I have more than 99%. In addition, many of my relatives - my sisters and cousins, for example - keep a huge portion of their net worth in Berkshire stock.

Charlie and I feel totally comfortable with this eggs-in-one-basket situation because Berkshire itself owns a wide variety of truly extraordinary businesses. Indeed, we believe that Berkshire is close to being unique in the quality and diversity of the businesses in which it owns either a controlling interest or a minority interest of significance.

Charlie and I cannot promise you results. But we can guarantee that your financial fortunes will move in lockstep with ours for whatever period of time you elect to be our partner. We have no interest in large salaries or options or other means of gaining an "edge" over you. We want to make money only when our partners do and in exactly the same proportion. Moreover, when I do something dumb, I want you to be able to derive some solace from the fact that my financial suffering is proportional to yours.

- 3. Our long-term economic goal (subject to some qualifications mentioned later) is to maximize Berkshire's average annual rate of gain in intrinsic business value on a per-share basis. We do not measure the economic significance or performance of Berkshire by its size; we measure by per-share progress. We are certain that the rate of per-share progress will diminish in the future - a greatly enlarged capital base will see to that. But we will be disappointed if our rate does not exceed that of the average large American corporation.*

Since that was written at yearend 1983, our intrinsic value (a topic I'll discuss a bit later) has increased at an annual rate of more than 25%, a pace that has definitely surprised both Charlie and me. Nevertheless the principle just stated remains valid: Operating with large amounts of capital as we do today, we cannot come close to performing as well as we once did with much smaller sums. The best rate of gain in intrinsic value we can even hope for is an average of 15% per annum, and we may well fall far short of that target. Indeed, we think very few large businesses have a chance of compounding intrinsic value at 15% per annum over an extended period of time. So it may be that we will end up meeting our stated goal - being above average - with gains that fall significantly short of 15%.

- 4. Our preference would be to reach our goal by directly owning a diversified group of businesses that generate cash and consistently earn above-average returns on capital. Our second choice is to own parts of similar businesses, attained primarily through purchases of marketable common stocks by our insurance subsidiaries. The price and availability of businesses and the need for insurance capital determine any given year's capital allocation.*

As has usually been the case, it is easier today to buy small pieces of outstanding businesses via the stock market than to buy similar businesses in their entirety on a negotiated basis. Nevertheless, we continue to prefer the 100% purchase, and in some years we get lucky: In the last three years, in fact, we made seven acquisitions. Though there will be dry years also, we expect to make a number of acquisitions in the

decades to come, and our hope is that they will be large. If these purchases approach the quality of those we have made in the past, Berkshire will be well served.

The challenge for us is to generate ideas as rapidly as we generate cash. In this respect, a depressed stock market is likely to present us with significant advantages. For one thing, it tends to reduce the prices at which entire companies become available for purchase. Second, a depressed market makes it easier for our insurance companies to buy small pieces of wonderful businesses - including additional pieces of businesses we already own - at attractive prices. And third, some of those same wonderful businesses, such as Coca-Cola, are consistent buyers of their own shares, which means that they, and we, gain from the cheaper prices at which they can buy.

Overall, Berkshire and its long-term shareholders benefit from a sinking stock market much as a regular purchaser of food benefits from declining food prices. So when the market plummets - as it will from time to time - neither panic nor mourn. It's good news for Berkshire.

- 5. Because of our two-pronged approach to business ownership and because of the limitations of conventional accounting, consolidated reported earnings may reveal relatively little about our true economic performance. Charlie and I, both as owners and managers, virtually ignore such consolidated numbers. However, we will also report to you the earnings of each major business we control, numbers we consider of great importance. These figures, along with other information we will supply about the individual businesses, should generally aid you in making judgments about them.*

To state things simply, we try to give you in the annual report the numbers and other information that really matter. Charlie and I pay a great deal of attention to how well our businesses are doing, and we also work to understand the environment in which each business is operating. For example, is one of our businesses enjoying an industry tailwind or is it facing a headwind? Charlie and I need to know exactly which situation prevails and to adjust our expectations accordingly. We will also pass along our conclusions to you.

Over time, practically all of our businesses have exceeded our expectations. But occasionally we have disappointments, and we will try to be as candid in informing you about those as we are in describing the happier experiences. When we use unconventional measures to chart our progress - for instance, you will be reading in our annual reports about insurance "float" - we will try to explain these concepts and why we regard them as important. In other words, we believe in telling you how we think so that you can evaluate not only Berkshire's businesses but also assess our approach to management and capital allocation.

- 6. Accounting consequences do not influence our operating or capital-allocation decisions. When acquisition costs are similar, we much prefer to purchase \$2 of earnings that is not reportable by us under standard accounting principles than to purchase \$1 of earnings that is reportable. This is precisely the choice that often faces us since entire businesses (whose earnings will be fully reportable) frequently sell for double the pro-rata price of small portions (whose earnings will be largely unreportable). In aggregate and over time, we expect the unreported earnings to be fully reflected in our intrinsic business value through capital gains.*

We attempt to offset the shortcomings of conventional accounting by regularly reporting "look-through" earnings (though, for special and nonrecurring reasons, we occasionally omit them). The look-through numbers include Berkshire's own reported operating earnings, excluding capital gains and purchase-accounting adjustments (an explanation of which occurs later in this message) plus Berkshire's share of

the undistributed earnings of our major investees - amounts that are not included in Berkshire's figures under conventional accounting. From these undistributed earnings of our investees we subtract the tax we would have owed had the earnings been paid to us as dividends. We also exclude capital gains, purchase-accounting adjustments and extraordinary charges or credits from the investee numbers.

We have found over time that the undistributed earnings of our investees, in aggregate, have been fully as beneficial to Berkshire as if they had been distributed to us (and therefore had been included in the earnings we officially report). This pleasant result has occurred because most of our investees are engaged in truly outstanding businesses that can often employ incremental capital to great advantage, either by putting it to work in their businesses or by repurchasing their shares. Obviously, every capital decision that our investees have made has not benefitted us as shareholders, but overall we have garnered far more than a dollar of value for each dollar they have retained. We consequently regard look-through earnings as realistically portraying our yearly gain from operations.

In 1992, our look-through earnings were \$604 million, and in that same year we set a goal of raising them by an average of 15% per annum to \$1.8 billion in the year 2000. Since that time, however, we have issued additional shares - including a significant number in the 1998 merger with General Re - so that we now need look-through earnings of \$2.4 billion in 2000 to match the per-share goal we originally were shooting for. This is a target we still hope to hit.

- 7. We use debt sparingly and, when we do borrow, we attempt to structure our loans on a long-term fixed-rate basis. We will reject interesting opportunities rather than over-leverage our balance sheet. This conservatism has penalized our results but it is the only behavior that leaves us comfortable, considering our fiduciary obligations to policyholders, lenders and the many equity holders who have committed unusually large portions of their net worth to our care. (As one of the Indianapolis "500" winners said: "To finish first, you must first finish.")*

The financial calculus that Charlie and I employ would never permit our trading a good night's sleep for a shot at a few extra percentage points of return. I've never believed in risking what my family and friends have and need in order to pursue what they don't have and don't need.

Besides, Berkshire has access to two low-cost, non-perilous sources of leverage that allow us to safely own far more assets than our equity capital alone would permit: deferred taxes and "float," the funds of others that our insurance business holds because it receives premiums before needing to pay out losses. Both of these funding sources have grown rapidly and now total about \$32 billion.

Better yet, this funding to date has been cost-free. Deferred tax liabilities bear no interest. And as long as we can break even in our insurance underwriting - which we have done, on the average, during our 32 years in the business - the cost of the float developed from that operation is zero. Neither item, of course, is equity; these are real liabilities. But they are liabilities without covenants or due dates attached to them. In effect, they give us the benefit of debt - an ability to have more assets working for us - but saddle us with none of its drawbacks.

Of course, there is no guarantee that we can obtain our float in the future at no cost. But we feel our chances of attaining that goal are as good as those of anyone in the insurance business. Not only have we reached the goal in the past (despite a number of important mistakes by your Chairman), our 1996 acquisition of GEICO materially improved our prospects for getting there in the future.

- 8. A managerial "wish list" will not be filled at shareholder expense. We will not diversify by purchasing entire businesses at control prices that ignore long-term economic consequences to*

our shareholders. We will only do with your money what we would do with our own, weighing fully the values you can obtain by diversifying your own portfolios through direct purchases in the stock market.

Charlie and I are interested only in acquisitions that we believe will raise the per-share intrinsic value of Berkshire's stock. The size of our paychecks or our offices will never be related to the size of Berkshire's balance sheet.

- 9. We feel noble intentions should be checked periodically against results. We test the wisdom of retaining earnings by assessing whether retention, over time, delivers shareholders at least \$1 of market value for each \$1 retained. To date, this test has been met. We will continue to apply it on a five-year rolling basis. As our net worth grows, it is more difficult to use retained earnings wisely.*

We continue to pass the test, but the challenges of doing so have grown more difficult. If we reach the point that we can't create extra value by retaining earnings, we will pay them out and let our shareholders deploy the funds.

- 10. We will issue common stock only when we receive as much in business value as we give. This rule applies to all forms of issuance - not only mergers or public stock offerings, but stock-for-debt swaps, stock options, and convertible securities as well. We will not sell small portions of your company - and that is what the issuance of shares amounts to - on a basis inconsistent with the value of the entire enterprise.*

When we sold the Class B shares in 1996, we stated that Berkshire stock was not undervalued - and some people found that shocking. That reaction was not well-founded. Shock should have registered instead had we issued shares when our stock was undervalued. Managements that say or imply during a public offering that their stock is undervalued are usually being economical with the truth or uneconomical with their existing shareholders' money: Owners unfairly lose if their managers deliberately sell assets for 80¢ that in fact are worth \$1. We didn't commit that kind of crime in our offering of Class B shares and we never will. (We did *not*, however, say at the time of the sale that our stock was overvalued, though many media have reported that we did.)

- 11. You should be fully aware of one attitude Charlie and I share that hurts our financial performance: Regardless of price, we have no interest at all in selling any good businesses that Berkshire owns. We are also very reluctant to sell sub-par businesses as long as we expect them to generate at least some cash and as long as we feel good about their managers and labor relations. We hope not to repeat the capital-allocation mistakes that led us into such sub-par businesses. And we react with great caution to suggestions that our poor businesses can be restored to satisfactory profitability by major capital expenditures. (The projections will be dazzling and the advocates sincere, but, in the end, major additional investment in a terrible industry usually is about as rewarding as struggling in quicksand.) Nevertheless, gin rummy managerial behavior (discard your least promising business at each turn) is not our style. We would rather have our overall results penalized a bit than engage in that kind of behavior.*

We continue to avoid gin rummy behavior. True, we closed our textile business in the mid-1980's after 20 years of struggling with it, but only because we felt it was doomed to run never-ending operating losses. We have not, however, given thought to selling operations that would command very fancy prices nor have we dumped our laggards, though we focus hard on curing the problems that cause them to lag.

12. *We will be candid in our reporting to you, emphasizing the pluses and minuses important in appraising business value. Our guideline is to tell you the business facts that we would want to know if our positions were reversed. We owe you no less. Moreover, as a company with a major communications business, it would be inexcusable for us to apply lesser standards of accuracy, balance and incisiveness when reporting on ourselves than we would expect our news people to apply when reporting on others. We also believe candor benefits us as managers: The CEO who misleads others in public may eventually mislead himself in private.*

At Berkshire you will find no "big bath" accounting maneuvers or restructurings nor any "smoothing" of quarterly or annual results. We will always tell you how many strokes we have taken on each hole and never play around with the scorecard. When the numbers are a very rough "guesstimate," as they necessarily must be in insurance reserving, we will try to be both consistent and conservative in our approach.

We will be communicating with you in several ways. Through the annual report, I try to give all shareholders as much value- defining information as can be conveyed in a document kept to reasonable length. We also try to convey a liberal quantity of condensed but important information in our quarterly reports, though I don't write those (one recital a year is enough). Still another important occasion for communication is our Annual Meeting, at which Charlie and I are delighted to spend five hours or more answering questions about Berkshire. But there is one way we can't communicate: on a one-on-one basis. That isn't feasible given Berkshire's many thousands of owners.

In all of our communications, we try to make sure that no single shareholder gets an edge: We do not follow the usual practice of giving earnings "guidance" or other information of value to analysts or large shareholders. Our goal is to have all of our owners updated at the same time.

13. *Despite our policy of candor, we will discuss our activities in marketable securities only to the extent legally required. Good investment ideas are rare, valuable and subject to competitive appropriation just as good product or business acquisition ideas are. Therefore we normally will not talk about our investment ideas. This ban extends even to securities we have sold (because we may purchase them again) and to stocks we are incorrectly rumored to be buying. If we deny those reports but say "no comment" on other occasions, the no-comments become confirmation.*

Though we continue to be unwilling to talk about specific stocks, we freely discuss our business and investment philosophy. I benefitted enormously from the intellectual generosity of Ben Graham, the greatest teacher in the history of finance, and I believe it appropriate to pass along what I learned from him, even if that creates new and able investment competitors for Berkshire just as Ben's teachings did for him.

AN ADDED PRINCIPLE

To the extent possible, we would like each Berkshire shareholder to record a gain or loss in market value during his period of ownership that is proportional to the gain or loss in per-share intrinsic value recorded by the company during that holding period. For this to come about, the relationship between the intrinsic value and the market price of a Berkshire share would need to remain constant, and by our preferences at 1-to-1. As that implies, we would rather see Berkshire's stock price at a fair level than a high level. Obviously, Charlie and I can't control Berkshire's price. But by our policies and communications, we can encourage informed, rational behavior by owners that, in turn, will tend to produce a stock price that is also rational. Our it's-as-bad-to-be- overvalued-as-to-be-undervalued approach may disappoint some shareholders. We believe, however, that it affords Berkshire the best prospect of attracting long-term

investors who seek to profit from the progress of the company rather than from the investment mistakes of their partners.

INTRINSIC VALUE

Now let's focus on two terms that I mentioned earlier and that you will encounter in future annual reports.

Let's start with intrinsic value, an all-important concept that offers the only logical approach to evaluating the relative attractiveness of investments and businesses. Intrinsic value can be defined simply: It is the discounted value of the cash that can be taken out of a business during its remaining life.

The calculation of intrinsic value, though, is not so simple. As our definition suggests, intrinsic value is an estimate rather than a precise figure, and it is additionally an estimate that must be changed if interest rates move or forecasts of future cash flows are revised. Two people looking at the same set of facts, moreover - and this would apply even to Charlie and me - will almost inevitably come up with at least slightly different intrinsic value figures. That is one reason we never give you our estimates of intrinsic value. What our annual reports do supply, though, are the facts that we ourselves use to calculate this value.

Meanwhile, we regularly report our per-share book value, an easily calculable number, though one of limited use. The limitations do not arise from our holdings of marketable securities, which are carried on our books at their current prices. Rather the inadequacies of book value have to do with the companies we control, whose values as stated on our books may be far different from their intrinsic values.

The disparity can go in either direction. For example, in 1964 we could state with certitude that Berkshire's per-share book value was \$19.46. However, that figure considerably overstated the company's intrinsic value, since all of the company's resources were tied up in a sub-profitable textile business. Our textile assets had neither going-concern nor liquidation values equal to their carrying values. Today, however, Berkshire's situation is reversed: Now, our book value *far* understates Berkshire's intrinsic value, a point true because many of the businesses we control are worth much more than their carrying value.

Inadequate though they are in telling the story, we give you Berkshire's book-value figures because they today serve as a rough, albeit significantly understated, tracking measure for Berkshire's intrinsic value. In other words, the percentage change in book value in any given year is likely to be reasonably close to that year's change in intrinsic value.

You can gain some insight into the differences between book value and intrinsic value by looking at one form of investment, a college education. Think of the education's cost as its "book value." If this cost is to be accurate, it should include the earnings that were foregone by the student because he chose college rather than a job.

For this exercise, we will ignore the important non-economic benefits of an education and focus strictly on its economic value. First, we must estimate the earnings that the graduate will receive over his lifetime and subtract from that figure an estimate of what he would have earned had he lacked his education. That gives us an excess earnings figure, which must then be discounted, at an appropriate interest rate, back to graduation day. The dollar result equals the intrinsic economic value of the education.

Some graduates will find that the book value of their education exceeds its intrinsic value, which means that whoever paid for the education didn't get his money's worth. In other cases, the intrinsic value of an

education will far exceed its book value, a result that proves capital was wisely deployed. In all cases, what is clear is that book value is meaningless as an indicator of intrinsic value.

PURCHASE-ACCOUNTING ADJUSTMENTS

Next: spinach time. I know that a discussion of accounting technicalities turns off many readers, so let me assure you that a full and happy life can still be yours if you decide to skip this section.

Our 1996 acquisition of GEICO, however, means that purchase-accounting adjustments of about \$40 million are charged against our annual earnings as recorded under generally accepted accounting principles (GAAP). Our General Re acquisition will produce an annual charge many times this number, but we don't have final figures at this time. The magnitude of these changes makes them a subject of importance to Berkshire. In our annual reports, therefore, we will sometimes talk of earnings that we will describe as "before purchase-accounting adjustments." The discussion that follows will tell you why we think earnings of that description have far more economic meaning than the earnings produced by GAAP.

When Berkshire buys a business for a premium over the GAAP net worth of the acquiree - as will usually be the case, since most companies we'd want to buy don't come at a discount - that premium has to be entered on the asset side of our balance sheet. There are loads of rules about just how a company should record the premium. But to simplify this discussion, we will focus on "Goodwill," the asset item to which almost all of Berkshire's acquisition premiums have been allocated. For example, when we acquired in 1996 the half of GEICO we didn't previously own, we recorded goodwill of about \$1.6 billion.

GAAP requires goodwill to be amortized - that is, written off - over a period no longer than 40 years. Therefore, to extinguish our \$1.6 billion in GEICO goodwill, we will take annual charges of about \$40 million until 2036. This amount is not deductible for tax purposes, so it reduces both our pre-tax and after-tax earnings by \$40 million.

In an accounting sense, consequently, our GEICO goodwill will disappear gradually in even-sized bites. But the one thing I can guarantee you is that the economic goodwill we have purchased at GEICO will not decline in the same measured way. In fact, my best guess is that the economic goodwill assignable to GEICO has dramatically increased since our purchase and will likely continue to increase - quite probably in a very substantial way.

I made a similar statement in our 1983 Annual Report about the goodwill attributed to See's Candy, when I used that company as an example in a discussion of goodwill accounting. At that time, our balance sheet carried about \$36 million of See's goodwill. We have since been charging about \$1 million against earnings every year in order to amortize the asset, and the See's goodwill on our balance sheet is now down to about \$21 million. In other words, from an accounting standpoint, See's is now presented as having lost a good deal of goodwill since 1983.

The economic facts could not be more different. In 1983, See's earned about \$27 million pre-tax on \$11 million of net operating assets; in 1997 it earned \$59 million on \$5 million of net operating assets. Clearly See's economic goodwill has increased dramatically during the interval rather than decreased. Just as clearly, See's is worth many hundreds of millions of dollars more than its stated value on our books.

We could, of course, be wrong, but we expect that GEICO's gradual loss of accounting value will continue to be paired with major increases in its economic value. Certainly that has been the pattern at most of our subsidiaries, not just See's. That is why we regularly present our operating earnings in a way that allows you to ignore all purchase-accounting adjustments.

Before leaving this subject, we should issue an important warning: Investors are often led astray by CEOs and Wall Street analysts who equate depreciation charges with the amortization charges we have just discussed. In no way are the two the same: With rare exceptions, depreciation is an economic cost every bit as real as wages, materials, or taxes. Certainly that is true at Berkshire and at virtually all the other businesses we have studied. Furthermore, we do not think so-called EBITDA (earnings before interest, taxes, depreciation and amortization) is a meaningful measure of performance. Managements that dismiss the importance of depreciation - and emphasize "cash flow" or EBITDA - are apt to make faulty decisions, and you should keep that in mind as you make your own investment decisions.

THE MANAGING OF BERKSHIRE

I think it's appropriate that I conclude with a discussion of Berkshire's management, today and in the future. As our first owner-related principle tells you, Charlie and I are the managing partners of Berkshire. But we subcontract all of the heavy lifting in this business to the managers of our subsidiaries. In fact, we delegate almost to the point of abdication: Though Berkshire has about 45,000 employees, only 12 of these are at headquarters.

Charlie and I mainly attend to capital allocation and the care and feeding of our key managers. Most of these managers are happiest when they are left alone to run their businesses, and that is customarily just how we leave them. That puts them in charge of all operating decisions and of dispatching the excess cash they generate to headquarters. By sending it to us, they don't get diverted by the various enticements that would come their way were they responsible for deploying the cash their businesses throw off. Furthermore, Charlie and I are exposed to a much wider range of possibilities for investing these funds than any of our managers could find in his or her own industry.

Most of our managers are independently wealthy, and it's therefore up to us to create a climate that encourages them to choose working with Berkshire over golfing or fishing. This leaves us needing to treat them fairly and in the manner that we would wish to be treated if our positions were reversed.

As for the allocation of capital, that's an activity both Charlie and I enjoy and in which we have acquired some useful experience. In a general sense, grey hair doesn't hurt on this playing field: You don't need good hand-eye coordination or well-toned muscles to push money around (thank heavens). As long as our minds continue to function effectively, Charlie and I can keep on doing our jobs pretty much as we have in the past.

On my death, Berkshire's ownership picture will change but not in a disruptive way: First, only about 1% of my stock will have to be sold to take care of bequests and taxes; second, the balance of my stock will go to my wife, Susan, if she survives me, or to a family foundation if she doesn't. In either event, Berkshire will possess a controlling shareholder guided by the same philosophy and objectives that now set our course.

At that juncture, the Buffett family will not be involved in managing the business, only in picking and overseeing the managers who do. Just who those managers will be, of course, depends on the date of my death. But I can anticipate what the management structure will be: Essentially my job will be split into two parts, with one executive becoming responsible for investments and another for operations. If the acquisition of new businesses is in prospect, the two will cooperate in making the decisions needed. Both executives will report to a board of directors who will be responsive to the controlling shareholder, whose interests will in turn be aligned with yours.

Were we to need the management structure I have just described on an immediate basis, my family and a few key individuals know who I would pick to fill both posts. Both currently work for Berkshire and are people in whom I have total confidence.

I will continue to keep my family posted on the succession issue. Since Berkshire stock will make up virtually my entire estate and will account for a similar portion of the assets of either my wife or the foundation for a considerable period after my death, you can be sure that I have thought through the succession question carefully. You can be equally sure that the principles we have employed to date in running Berkshire will continue to guide the managers who succeed me.

Lest we end on a morbid note, I also want to assure you that I have never felt better. I love running Berkshire, and if enjoying life promotes longevity, Methuselah's record is in jeopardy.

Warren E. Buffett

Chairman

Foreword: Poor Charlie's Almanack

By Warren E. Buffett

From 1733 to 1758, Ben Franklin dispensed useful and timeless advice through *Poor Richard's Almanack*. Among the virtues extolled were thrift, duty, hard work, and simplicity.

Subsequently, two centuries went by during which Ben's thoughts on these subjects were regarded as the last word. Then Charlie Munger stepped forth.

Initially a mere disciple of Ben's, Charlie was soon breaking new ground. What Ben had recommended, Charlie demanded. If Ben suggested saving pennies, Charlie raised the stakes. If Ben said to be prompt, Charlie said to be early. Life under Ben's rules began to look positively cushy compared with the rigor demanded by Munger.

Moreover, Charlie consistently practiced what he preached (and, oh, how he preached). Ben, in his will, created two small philanthropic funds that were designed to teach the magic of compound interest. Early on, Charlie decided that this was a subject far too important to be taught through some posthumous project. Instead, he opted to become a living lesson in compounding, eschewing frivolous (defined as "any") expenditures that might sap the power of his example. Consequently, the members of Charlie's family learned the joy of extended bus trips while their wealthy friends, imprisoned in private jets, missed these enriching experiences.

In certain areas, however, Charlie has not sought to improve on Ben's thinking. For example, Ben's "Advice on the Choice of a Mistress" essay has left Charlie in the "I have nothing to add" mode that is his trademark at Berkshire annual meetings.

As for myself, I'd like to offer some "Advice on the Choice of a Partner." Pay attention.

Look first for someone both smarter and wiser than you are. After locating him (or her), ask him not to flaunt his superiority so that you may enjoy acclaim for the many accomplishments that sprang from his thoughts and advice. Seek a partner who will never second-guess you nor sulk when you make expensive mistakes. Look also for a generous soul who will put up his own money and work for peanuts. Finally, join with someone who will constantly add to the fun as you travel a long road together.

All of the above is splendid advice. (I've never scored less than an A in self-graded exams.) In fact, it's so splendid that I set out in 1959 to follow it slavishly. And there was only one partner who fit my bill of particulars in every way—Charlie.

In Ben's famous essay, he says that only an older mistress makes sense, and he goes on to give eight very good reasons as to why this is so. His clincher: "... and lastly, they are so grateful."

Charlie and I have now been partners for forty-five years. I'm not sure whether he had seven other reasons for selecting me. But I definitely meet Ben's eighth criterion. I couldn't be more grateful.

Warren Buffett

"A partner who is not subservient, who is himself extremely logical, is one of the best mechanisms you can have."

Letter to Leon Cooperman on Henry Singleton and Loew's

11/23/2007

November 23, 2007

Dear Lee,

I don't think you could have picked two better subjects. Henry is a manager that all investors, CEOs, would-be CEOs, and MBA students should study. In the end, it was 100% rational and there are very few CEOs about whom I can make that statement.

The stock-repurchase situation is fascinating to me. That's because the answer is so simple. You do it when you are buying dollar bills at clear cut and significant discount and only then.

As a general observation I would say that most companies that repurchased shares 30 years ago were doing it for the right reasons, and most companies doing it now are wrong when doing so. Time after time, I see managers who are attempting to be fashionable or subconsciously hoping to support their stock. Loews is a great example of a company that's always repurchased shares for the right reasons. I could give examples of the reverse, but I follow the dictum praise by name, criticize by category.

Best regards

Warren

Letter to Leon Cooperman on the conversion of Omega from hedge fund to family office

7/23/2018

Hi Lee,

You were terrific on CNBC today. I think I know exactly the emotions you experienced and the reasoning you followed since I had done somewhat the same thing in 1969.

The one thing I can guarantee you is that your parents would be extraordinarily pleased at the course you have followed — and are going to continue to follow in life.

Example can be powerful. At The Giving Pledge, we have a disproportionately low number of people who have made their fortunes in Wall Street. You can be a powerful influence in having them rethink their priorities. I hope you make use of the moral podium on which you stand.

I agree with you that I didn't ask for enough when I called on you to pledge 50% — and I'm glad you are correcting for my error.

Best Regards,

Warren

Foreword: Security Analysis (6th Ed.)

By Warren E. Buffett

There are four books in my overflowing library that I particularly treasure, each of them written more than 50 years ago. Although, would still be of enormous value to me if I were to read them today for the first time; their wisdom endures though their pages fade.

Two of those books are first editions of *The Wealth of Nations* (1776), by Adam Smith, and *The Intelligent Investor* (1949), by Benjamin Graham. A third is an original copy of the book you hold in your hands, *Graham and Dodd's Security Analysis*. I studied from *Security Analysis* while I was at Columbia University in 1950 and 1951, when I had the extraordinary good luck to have Ben Graham and Dave Dodd as teachers. Together, the book and the men changed my life.

On the utilitarian side, what I learned then became the bedrock upon which all of my investment and business decisions have been built. Prior to meeting Ben and Dave, I had long been fascinated by the stock market. Before I bought my first stock at age 11—it took me until then to accumulate the \$115 required for the purchase—I had read every book in the Omaha Public Library having to do with the stock market. I found many of them fascinating and all interesting. But none were really useful.

My intellectual odyssey ended, however, when I met Ben and Dave, first through their writings and then in person. They laid out a roadmap for investing that I have now been following for 57 years. There's been no reason to look for another.

WARREN E. BUFFETT, CHAIRMAN

October 6, 2008

The Honorable Henry M. Paulson, Jr.
Secretary of the Treasury
1500 Pennsylvania Avenue, NW
Washington, DC 20220

Dear Hank:

I have previously mentioned to you my thought that an investment fund could be formed that would address some of the public's concerns about Treasury's plans to purchase illiquid mortgages. In this letter, I will spell out my thinking in greater detail.

Some critics have worried that Treasury won't buy mortgages at prices close to the market but will instead buy at higher "theoretical" prices that would please selling institutions. Critics have also questioned how Treasury would manage the mortgages purchased: Would Treasury act as a true investor or would it be overly influenced by pressures from Congress or the media? For example, would Treasury be slow to foreclose on properties or too bureaucratic in judging requests for loan forbearance? Additionally, many who are comfortable with a Department of the Treasury headed by someone with your market knowledge are worried about how the investment program would be administered by a future Treasury Secretary who had to rely on a bureaucracy to make important market decisions.

What I would like to suggest is a program that allows Treasury to buy more than the \$700 billion of assets presently anticipated and allows it to do so in a way that dramatically reduces the risk – to almost zero – that Treasury will lose money on its purchases. Indeed, the program I recommend is highly likely to produce profits. Let's call my proposed entity the Public-Private Partnership Fund (PPPF).

This entity would initially be capitalized with \$10 billion of common stock held by the private sector and \$40 billion of notes owned by Treasury. The notes would be due in ten years and carry an interest rate equal to the rate being paid by Treasury on its ten-year bond at the time PPPF was created. These notes would have absolute seniority. That is, they would be paid in full before the common stock would receive a nickel.

PPPF would operate as a REIT, LLC or in some other form that would receive flow-through tax treatment.

With the funds it had raised, PPPF would buy \$50 billion of mortgages (with a far greater principal amount of course). It would focus on whole loans and residential mortgage-backed securities (RMBS) and stay away from second mortgages and exotic instruments such as CDOs squared. Going by today's prices, much of what PPPF would buy would likely be priced at 50-80% of par.

In time, the mortgages and securities in the portfolio would produce cash, through paydowns or later sales, that could be paid to Treasury and the private investors. The cash would first go to pay off Treasury, until it had recovered its entire investment along with interest. That having been accomplished, the private shareholders would be entitled to recoup both their \$10 billion and a rate of interest equal to that received by Treasury. Finally, any profits would be split with three-fourths going to the shareholders and one-fourth going to Treasury.

Let me sum up the effects of this plan: PPPF's capitalization would turn \$40 billion of Treasury money into \$50 billion of mortgage purchases. More important, Treasury would operate with a \$10 billion "cushion" from loss, because the private money in PPPF would be on the front line, eating that amount of net loss if losses were sustained.

Given this structure, PPPF's shareholders would have every incentive to make intelligent purchases. It should be clear to the American public that purchases are not being made at "bail-out" prices for imprudent institutions, but rather at "intelligent investor" prices for Treasury and PPPF shareholders.

The Honorable Henry M. Paulson, Jr.

October 6, 2008

Page 3

Exploring the merits of this plan, I have talked with Bill Gross and Mohamed El-Erian of PIMCO, and they have told me they would manage this operation on a pro-bono basis. The managing entity would need a small staff, of course. But overall costs would be minimal and, in any event, would be borne by the common stock, since all expenses and losses would go against their \$10 billion.

I've also talked with Lloyd Blankfein at Goldman, Sachs, who says that firm would work on a pro-bono basis to secure the \$10 billion of equity capital. The company I head, Berkshire Hathaway, would be pleased to invest \$500 million, and I think the remainder of the funds needed would be quickly committed by major institutional investors – perhaps especially pension funds.

The reason why I expect the funds to be readily available is simple: If mortgages are purchased at current levels by an entity employing significant leverage and working with dependable, low-cost funds supplied by the U. S. Treasury, profits are very likely to be good—and perhaps even exceptional. That is true because prices have fallen to a level that reflects the inability of other buyers to obtain leverage. Thus returns for an investment operation that has access to long-term Treasury-type funding should be particularly interesting. Unlevered returns of 10% -- and present buyers are seeking more than this – can turn into 25% returns with the leverage I propose.

Once this program is off the ground, I would suggest that the capitalization of PPPF – both equity and debt – be doubled. In this instance, however, Wall Street firms – again on a pro-bono basis – would offer \$10 billion of PPPF's common stock to the American public on exactly the same terms as those granted the initial institutional investors. If PPPF is going to be a good deal for equity holders – and I believe it will be – I would want to be sure that the average American has a chance to share in such an investment on a basis equal to that secured by Berkshire Hathaway and other institutional investors. If this offer is fully subscribed, Treasury would purchase an additional \$40 billion of notes, giving PPPF total buying power of \$100 billion.

I would be willing to personally buy \$100 million of stock in this public offering. (This constitutes about 20% of my net worth outside of my Berkshire holdings, which as you know are promised to charity.)

The Honorable Henry M. Paulson, Jr.
October 6, 2008
Page 4

Another detail: In the initial offering to institutions, I would bar hedge funds or other vehicles in which the manager receives an override of profits from investing. I think that in a government-connected enterprise such as this, you would want to have investors receive all of the profits available instead of splitting them with managers taking fat overrides.

* * * * *

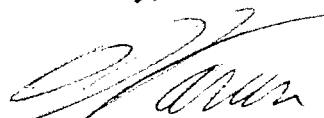

The most likely scenario under which PPPF would prove disappointing is one in which market prices make it impossible for it to buy the contemplated \$100 billion of mortgages at risk-adjusted prices that promise good returns. To cover this possibility, the plan could stipulate that money be proportionately returned to Treasury and to common shareholders if after two years PPPF had been unsuccessful in reaching its goal for purchases.

Alternatively, PPPF could become a purchaser of new “non-conforming” mortgages – those whose size exceeds Freddie and Fannie limits. This move would stimulate the housing market and reduce the high interest rates that non-conforming mortgages now carry (compared to Treasury yields). Any move that PPPF made in this direction would need to be approved by both Treasury and the majority of the common stock. Were this plan to be put into effect, moreover, PPPF should only deal with borrowers putting up downpayments of size, earning comfortable incomes relative to debt service requirements, and supplying documentation of their creditworthiness.

Hank, these are all tentative ideas. But I think it’s enormously important that the public have confidence that Treasury’s activities in the mortgage field are sound and potentially profitable. The public is skeptical – indeed, disbelieving – about this point now, but I believe PPPF could go a long way toward correcting this misconception.

If this plan, or some variation, appears to be feasible, Bill, Mohamed, Lloyd and I – and I’m sure a myriad of others – are ready to help.

Sincerely,

Warren E. Buffett

Berkshire – Past, Present and Future

In the Beginning

On May 6, 1964, Berkshire Hathaway, then run by a man named Seabury Stanton, sent a letter to its shareholders offering to buy 225,000 shares of its stock for \$11.375 per share. I had expected the letter; I was surprised by the price.

Berkshire then had 1,583,680 shares outstanding. About 7% of these were owned by Buffett Partnership Ltd. (“BPL”), an investing entity that I managed and in which I had virtually all of my net worth. Shortly before the tender offer was mailed, Stanton had asked me at what price BPL would sell its holdings. I answered \$11.50, and he said, “Fine, we have a deal.” Then came Berkshire’s letter, offering an eighth of a point less. I bristled at Stanton’s behavior and didn’t tender.

That was a monumentally stupid decision.

Berkshire was then a northern textile manufacturer mired in a terrible business. The industry in which it operated was heading south, both metaphorically and physically. And Berkshire, for a variety of reasons, was unable to change course.

That was true even though the industry’s problems had long been widely understood. Berkshire’s own Board minutes of July 29, 1954, laid out the grim facts: “The textile industry in New England started going out of business forty years ago. During the war years this trend was stopped. The trend must continue until supply and demand have been balanced.”

About a year after that board meeting, Berkshire Fine Spinning Associates and Hathaway Manufacturing – both with roots in the 19th Century – joined forces, taking the name we bear today. With its fourteen plants and 10,000 employees, the merged company became the giant of New England textiles. What the two managements viewed as a merger agreement, however, soon morphed into a suicide pact. During the seven years following the consolidation, Berkshire operated at an overall loss, and its net worth shrunk by 37%.

Meanwhile, the company closed nine plants, sometimes using the liquidation proceeds to repurchase shares. And that pattern caught my attention.

I purchased BPL’s first shares of Berkshire in December 1962, anticipating more closings and more repurchases. The stock was then selling for \$7.50, a wide discount from per-share working capital of \$10.25 and book value of \$20.20. Buying the stock at that price was like picking up a discarded cigar butt that had one puff remaining in it. Though the stub might be ugly and soggy, the puff would be free. Once that momentary pleasure was enjoyed, however, no more could be expected.

Berkshire thereafter stuck to the script: It soon closed another two plants, and in that May 1964 move, set out to repurchase shares with the shutdown proceeds. The price that Stanton offered was 50% above the cost of our original purchases. There it was – my free puff, just waiting for me, after which I could look elsewhere for other discarded butts.

Instead, irritated by Stanton’s chiseling, I ignored his offer and began to aggressively buy more Berkshire shares.

By April 1965, BPL owned 392,633 shares (out of 1,017,547 then outstanding) and at an early-May board meeting we formally took control of the company. Through Seabury's and my childish behavior – after all, what was an eighth of a point to either of us? – he lost his job, and I found myself with more than 25% of BPL's capital invested in a terrible business about which I knew very little. I became the dog who caught the car.

Because of Berkshire's operating losses and share repurchases, its net worth at the end of fiscal 1964 had fallen to \$22 million from \$55 million at the time of the 1955 merger. The full \$22 million was required by the textile operation: The company had no excess cash and owed its bank \$2.5 million. (Berkshire's 1964 annual report is reproduced on pages 130-142.)

For a time I got lucky: Berkshire immediately enjoyed two years of good operating conditions. Better yet, its earnings in those years were free of income tax because it possessed a large loss carry-forward that had arisen from the disastrous results in earlier years.

Then the honeymoon ended. During the 18 years following 1966, we struggled unremittingly with the textile business, all to no avail. But stubbornness – stupidity? – has its limits. In 1985, I finally threw in the towel and closed the operation.

Undeterred by my first mistake of committing much of BPL's resources to a dying business, I quickly compounded the error. Indeed, my second blunder was far more serious than the first, eventually becoming the most costly in my career.

Early in 1967, I had Berkshire pay \$8.6 million to buy National Indemnity Company ("NICO"), a small but promising Omaha-based insurer. (A tiny sister company was also included in the deal.) Insurance was in my sweet spot: I understood and liked the industry.

Jack Ringwalt, the owner of NICO, was a long-time friend who wanted to sell to me – me, personally. In no way was his offer intended for Berkshire. So why did I purchase NICO for Berkshire rather than for BPL? I've had 48 years to think about that question, and I've yet to come up with a good answer. I simply made a colossal mistake.

If BPL had been the purchaser, my partners and I would have owned 100% of a fine business, destined to form the base for building the company Berkshire has become. Moreover, our growth would not have been impeded for nearly two decades by the unproductive funds imprisoned in the textile operation. Finally, our subsequent acquisitions would have been owned in their entirety by my partners and me rather than being 39%-owned by the legacy shareholders of Berkshire, to whom we had no obligation. Despite these facts staring me in the face, I opted to marry 100% of an excellent business (NICO) to a 61%-owned terrible business (Berkshire Hathaway), a decision that eventually diverted \$100 billion or so from BPL partners to a collection of strangers.

One more confession and then I'll go on to more pleasant topics: Can you believe that in 1975 I bought Waumbec Mills, another New England textile company? Of course, the purchase price was a "bargain" based on the assets we received and the *projected* synergies with Berkshire's existing textile business. Nevertheless – surprise, surprise – Waumbec was a disaster, with the mill having to be closed down not many years later.

And now some good news: The northern textile industry is finally extinct. You need no longer panic if you hear that I've been spotted wandering around New England.

Charlie Straightens Me Out

My cigar-butt strategy worked very well while I was managing small sums. Indeed, the many dozens of free puffs I obtained in the 1950s made that decade by far the best of my life for both relative and absolute investment performance.

Even then, however, I made a few exceptions to cigar butts, the most important being GEICO. Thanks to a 1951 conversation I had with Lorimer Davidson, a wonderful man who later became CEO of the company, I learned that GEICO was a terrific business and promptly put 65% of my \$9,800 net worth into its shares. Most of my gains in those early years, though, came from investments in mediocre companies that traded at bargain prices. Ben Graham had taught me that technique, and it worked.

But a major weakness in this approach gradually became apparent: Cigar-butt investing was scalable only to a point. With large sums, it would never work well.

In addition, though marginal businesses purchased at cheap prices may be attractive as short-term investments, they are the wrong foundation on which to build a large and enduring enterprise. Selecting a marriage partner clearly requires more demanding criteria than does dating. (Berkshire, it should be noted, would have been a highly satisfactory “date”: If we had taken Seabury Stanton’s \$11.375 offer for our shares, BPL’s weighted annual return on its Berkshire investment would have been about 40%.)

* * * * *

It took Charlie Munger to break my cigar-butt habits and set the course for building a business that could combine huge size with satisfactory profits. Charlie had grown up a few hundred feet from where I now live and as a youth had worked, as did I, in my grandfather’s grocery store. Nevertheless, it was 1959 before I met Charlie, long after he had left Omaha to make Los Angeles his home. I was then 28 and he was 35. The Omaha doctor who introduced us predicted that we would hit it off – and we did.

If you’ve attended our annual meetings, you know Charlie has a wide-ranging brilliance, a prodigious memory, and some firm opinions. I’m not exactly wishy-washy myself, and we sometimes don’t agree. In 56 years, however, we’ve never had an argument. When we differ, Charlie usually ends the conversation by saying: “Warren, think it over and you’ll agree with me because you’re smart and I’m right.”

What most of you do *not* know about Charlie is that architecture is among his passions. Though he began his career as a practicing lawyer (with his time billed at \$15 per hour), Charlie made his first real money in his 30s by designing and building five apartment projects near Los Angeles. Concurrently, he designed the house that he lives in today – some 55 years later. (Like me, Charlie can’t be budged if he is happy in his surroundings.) In recent years, Charlie has designed large dorm complexes at Stanford and the University of Michigan and today, at age 91, is working on another major project.

From my perspective, though, Charlie’s most important architectural feat was the design of today’s Berkshire. The blueprint he gave me was simple: Forget what you know about buying fair businesses at wonderful prices; instead, buy wonderful businesses at fair prices.

Altering my behavior is not an easy task (ask my family). I had enjoyed reasonable success without Charlie's input, so why should I listen to a lawyer who had never spent a day in business school (when – ahem – I had attended *three*). But Charlie never tired of repeating his maxims about business and investing to me, and his logic was irrefutable. Consequently, Berkshire has been built to Charlie's blueprint. My role has been that of general contractor, with the CEOs of Berkshire's subsidiaries doing the real work as sub-contractors.

The year 1972 was a turning point for Berkshire (though not without occasional backsliding on my part – remember my 1975 purchase of Waumbec). We had the opportunity then to buy See's Candy for Blue Chip Stamps, a company in which Charlie, I and Berkshire had major stakes, and which was later merged into Berkshire.

See's was a legendary West Coast manufacturer and retailer of boxed chocolates, then annually earning about \$4 million pre-tax while utilizing only \$8 million of net tangible assets. Moreover, the company had a huge asset that did not appear on its balance sheet: a broad and durable competitive advantage that gave it significant pricing power. That strength was virtually certain to give See's major gains in earnings over time. Better yet, these would materialize with only minor amounts of incremental investment. In other words, See's could be expected to gush cash for decades to come.

The family controlling See's wanted \$30 million for the business, and Charlie rightly said it was worth that much. But I didn't want to pay more than \$25 million and wasn't all that enthusiastic even at that figure. (A price that was three times net tangible assets made me gulp.) My misguided caution could have scuttled a terrific purchase. But, luckily, the sellers decided to take our \$25 million bid.

To date, See's has earned \$1.9 billion pre-tax, with its growth having required added investment of only \$40 million. See's has thus been able to distribute huge sums that have helped Berkshire buy other businesses that, in turn, have themselves produced large distributable profits. (Envision rabbits breeding.) Additionally, through watching See's in action, I gained a business education about the value of powerful brands that opened my eyes to many other profitable investments.

Even with Charlie's blueprint, I have made plenty of mistakes since Waumbec. The most gruesome was Dexter Shoe. When we purchased the company in 1993, it had a terrific record and in no way looked to me like a cigar butt. Its competitive strengths, however, were soon to evaporate because of foreign competition. And I simply didn't see that coming.

Consequently, Berkshire paid \$433 million for Dexter and, rather promptly, its value went to zero. GAAP accounting, however, doesn't come close to recording the magnitude of my error. The fact is that I gave Berkshire stock to the sellers of Dexter rather than cash, and the shares I used for the purchase are now worth about \$5.7 billion. As a financial disaster, this one deserves a spot in the Guinness Book of World Records.

Several of my subsequent errors also involved the use of Berkshire shares to purchase businesses whose earnings were destined to simply limp along. Mistakes of that kind are deadly. Trading shares of a wonderful business – which Berkshire most certainly is – for ownership of a so-so business irreparably destroys value.

We've also suffered financially when this mistake has been committed by companies whose shares Berkshire has owned (with the errors sometimes occurring while I was serving as a director). Too often CEOs seem blind to an elementary reality: The intrinsic value of the shares you give in an acquisition must not be greater than the intrinsic value of the business you receive.

I've yet to see an investment banker quantify this all-important math when he is presenting a stock-for-stock deal to the board of a potential acquirer. Instead, the banker's focus will be on describing "customary" premiums-to-market-price that are currently being paid for acquisitions – an absolutely asinine way to evaluate the attractiveness of an acquisition – or whether the deal will increase the acquirer's earnings-per-share (which in itself should be far from determinative). In striving to achieve the desired per-share number, a panting CEO and his "helpers" will often conjure up fanciful "synergies." (As a director of 19 companies over the years, I've never heard "dis-synergies" mentioned, though I've witnessed plenty of these once deals have closed.) Post mortems of acquisitions, in which reality is honestly compared to the original projections, are rare in American boardrooms. They should instead be standard practice.

I can promise you that long after I'm gone, Berkshire's CEO and Board will carefully make intrinsic value calculations before issuing shares in any acquisitions. You can't get rich trading a hundred-dollar bill for eight tens (even if your advisor has handed you an expensive "fairness" opinion endorsing that swap).

Overall, Berkshire's acquisitions have worked out well – and *very* well in the case of a few large ones. So, too, have our investments in marketable securities. The latter are always valued on our balance sheet at their market prices so any gains – including those unrealized – are immediately reflected in our net worth. But the businesses we buy outright are never revalued upward on our balance sheet, even when we could sell them for many billions of dollars more than their carrying value. The unrecorded gains in the value of Berkshire's subsidiaries have become huge, with these growing at a particularly fast pace in the last decade.

Listening to Charlie has paid off.

Berkshire Today

Berkshire is now a sprawling conglomerate, constantly trying to sprawl further.

Conglomerates, it should be acknowledged, have a terrible reputation with investors. And they richly deserve it. Let me first explain why they are in the doghouse, and then I will go on to describe why the conglomerate form brings huge and enduring advantages to Berkshire.

Since I entered the business world, conglomerates have enjoyed several periods of extreme popularity, the silliest of which occurred in the late 1960s. The drill for conglomerate CEOs then was simple: By personality, promotion or dubious accounting – and often by all three – these managers drove a fledgling conglomerate’s stock to, say, 20 times earnings and then issued shares as fast as possible to acquire another business selling at ten-or-so times earnings. They immediately applied “pooling” accounting to the acquisition, which – with not a dime’s worth of change in the underlying businesses – automatically increased per-share earnings, and used the rise as proof of managerial genius. They next explained to investors that this sort of talent justified the maintenance, or even the enhancement, of the acquirer’s p/e multiple. And, finally, they promised to endlessly repeat this procedure and thereby create ever-increasing per-share earnings.

Wall Street’s love affair with this hocus-pocus intensified as the 1960s rolled by. The Street’s denizens are always ready to suspend disbelief when dubious maneuvers are used to manufacture rising per-share earnings, particularly if these acrobatics produce mergers that generate huge fees for investment bankers. Auditors willingly sprinkled their holy water on the conglomerates’ accounting and sometimes even made suggestions as to how to further juice the numbers. For many, gushers of easy money washed away ethical sensitivities.

Since the per-share earnings gains of an expanding conglomerate came from exploiting p/e differences, its CEO had to search for businesses selling at low multiples of earnings. These, of course, were characteristically mediocre businesses with poor long-term prospects. This incentive to bottom-fish usually led to a conglomerate’s collection of underlying businesses becoming more and more junky. That mattered little to investors: It was deal velocity and pooling accounting they looked to for increased earnings.

The resulting firestorm of merger activity was fanned by an adoring press. Companies such as ITT, Litton Industries, Gulf & Western, and LTV were lionized, and their CEOs became celebrities. (These once-famous conglomerates are now long gone. As Yogi Berra said, “Every Napoleon meets his Watergate.”)

Back then, accounting shenanigans of all sorts – many of them ridiculously transparent – were excused or overlooked. Indeed, having an accounting wizard at the helm of an expanding conglomerate was viewed as a huge plus: Shareholders in those instances could be sure that *reported* earnings would never disappoint, no matter how bad the operating realities of the business might become.

In the late 1960s, I attended a meeting at which an acquisitive CEO bragged of his “bold, imaginative accounting.” Most of the analysts listening responded with approving nods, seeing themselves as having found a manager whose forecasts were certain to be met, whatever the business results might be.

Eventually, however, the clock struck twelve, and everything turned to pumpkins and mice. Once again, it became evident that business models based on the serial issuances of overpriced shares – just like chain-letter models – most assuredly redistribute wealth, but in no way create it. Both phenomena, nevertheless, periodically blossom in our country – they are every promoter’s dream – though often they appear in a carefully-crafted disguise. The ending is always the same: Money flows from the gullible to the fraudster. And with stocks, unlike chain letters, the sums hijacked can be staggering.

At both BPL and Berkshire, we have *never* invested in companies that are hell-bent on issuing shares. That behavior is one of the surest indicators of a promotion-minded management, weak accounting, a stock that is overpriced and – all too often – outright dishonesty.

* * * * *

So what do Charlie and I find so attractive about Berkshire’s conglomerate structure? To put the case simply: If the conglomerate form is used judiciously, it is an ideal structure for maximizing long-term capital growth.

One of the heralded virtues of capitalism is that it efficiently allocates funds. The argument is that markets will direct investment to promising businesses and deny it to those destined to wither. That is true: With all its excesses, market-driven allocation of capital is usually far superior to any alternative.

Nevertheless, there are often obstacles to the rational movement of capital. As those 1954 Berkshire minutes made clear, capital withdrawals within the textile industry that should have been obvious were delayed for decades because of the vain hopes and self-interest of managements. Indeed, I myself delayed abandoning our obsolete textile mills for far too long.

A CEO with capital employed in a declining operation seldom elects to massively redeploy that capital into unrelated activities. A move of that kind would usually require that long-time associates be fired and mistakes be admitted. Moreover, it’s unlikely *that* CEO would be the manager you would wish to handle the redeployment job even if he or she was inclined to undertake it.

At the shareholder level, taxes and frictional costs weigh heavily on individual investors when they attempt to reallocate capital among businesses and industries. Even tax-free institutional investors face major costs as they move capital because they usually need intermediaries to do this job. A lot of mouths with expensive tastes then clamor to be fed – among them investment bankers, accountants, consultants, lawyers and such capital-reallocators as leveraged buyout operators. Money-shufflers don’t come cheap.

In contrast, a conglomerate such as Berkshire is perfectly positioned to allocate capital rationally and at minimal cost. Of course, form itself is no guarantee of success: We have made plenty of mistakes, and we will make more. Our structural advantages, however, are formidable.

At Berkshire, we can – without incurring taxes or much in the way of other costs – move huge sums from businesses that have limited opportunities for incremental investment to other sectors with greater promise. Moreover, we are free of historical biases created by lifelong association with a given industry and are not subject to pressures from colleagues having a vested interest in maintaining the status quo. That’s important: If horses had controlled investment decisions, there would have been no auto industry.

Another major advantage we possess is the ability to buy *pieces* of wonderful businesses – a.k.a. common stocks. That’s not a course of action open to most managements. Over our history, this strategic alternative has proved to be very helpful; a broad range of options always sharpens decision-making. The businesses we are offered by the stock market every day – in small pieces, to be sure – are often far more attractive than the businesses we are concurrently being offered in their entirety. Additionally, the gains we’ve realized from marketable securities have helped us make certain large acquisitions that would otherwise have been beyond our financial capabilities.

In effect, the world is Berkshire’s oyster – a world offering us a range of opportunities far beyond those realistically open to most companies. We are limited, of course, to businesses whose economic prospects we can evaluate. And that’s a serious limitation: Charlie and I have no idea what a great many companies will look like ten years from now. But that limitation is much smaller than that borne by an executive whose experience has been confined to a single industry. On top of that, we can profitably scale to a *far* larger size than the many businesses that are constrained by the limited potential of the single industry in which they operate.

I mentioned earlier that See’s Candy had produced huge earnings compared to its modest capital requirements. We would have loved, of course, to intelligently use those funds to expand our candy operation. But our many attempts to do so were largely futile. So, without incurring tax inefficiencies or frictional costs, we have used the excess funds generated by See’s to help purchase other businesses. If See’s had remained a stand-alone company, its earnings would have had to be distributed to investors to redeploy, sometimes after being heavily depleted by large taxes and, almost always, by significant frictional and agency costs.

* * * * *

Berkshire has one further advantage that has become increasingly important over the years: We are now the home of choice for the owners and managers of many outstanding businesses.

Families that own successful businesses have multiple options when they contemplate sale. Frequently, the best decision is to do nothing. There are worse things in life than having a prosperous business that one understands well. But sitting tight is seldom recommended by Wall Street. (Don’t ask the barber whether you need a haircut.)

When one part of a family wishes to sell while others wish to continue, a public offering often makes sense. But, when owners wish to cash out entirely, they usually consider one of two paths.

The first is sale to a competitor who is salivating at the possibility of wringing “synergies” from the combining of the two companies. This buyer invariably contemplates getting rid of large numbers of the seller’s associates, the very people who have helped the owner build his business. A caring owner, however – and there are plenty of them – usually does not want to leave his long-time associates sadly singing the old country song: “*She got the goldmine, I got the shaft.*”

The second choice for sellers is the Wall Street buyer. For some years, these purchasers accurately called themselves “leveraged buyout firms.” When that term got a bad name in the early 1990s – remember *RJR and Barbarians at the Gate?* – these buyers hastily relabeled themselves “private-equity.”

The name may have changed but that was all: Equity is dramatically *reduced* and debt is piled on in virtually all private-equity purchases. Indeed, the amount that a private-equity purchaser offers to the seller is in part determined by the buyer assessing the *maximum* amount of debt that can be placed on the acquired company.

Later, if things go well and equity begins to build, leveraged buy-out shops will often seek to re-leverage with new borrowings. They then typically use part of the proceeds to pay a huge dividend that drives equity sharply downward, sometimes even to a negative figure.

In truth, “equity” is a dirty word for many private-equity buyers; what they love is debt. And, because debt is currently so inexpensive, these buyers can frequently pay top dollar. Later, the business will be resold, often to another leveraged buyer. In effect, the business becomes a piece of merchandise.

Berkshire offers a third choice to the business owner who wishes to sell: a permanent home, in which the company’s people and culture will be retained (though, occasionally, management changes will be needed). Beyond that, any business we acquire dramatically increases its financial strength and ability to grow. Its days of dealing with banks and Wall Street analysts are also forever ended.

Some sellers don’t care about these matters. But, when sellers do, Berkshire does not have a lot of competition.

* * * * *

Sometimes pundits propose that Berkshire spin-off certain of its businesses. These suggestions make no sense. Our companies are worth more as part of Berkshire than as separate entities. One reason is our ability to move funds between businesses or into new ventures instantly and without tax. In addition, certain costs duplicate themselves, in full or part, if operations are separated. Here’s the most obvious example: Berkshire incurs nominal costs for its single board of directors; were our dozens of subsidiaries to be split off, the overall cost for directors would soar. So, too, would regulatory and administration expenditures.

Finally, there are sometimes important tax efficiencies for Subsidiary A because we own Subsidiary B. For example, certain tax credits that are available to our utilities are currently realizable only because we generate huge amounts of taxable income at other Berkshire operations. That gives Berkshire Hathaway Energy a major advantage over most public-utility companies in developing wind and solar projects.

Investment bankers, being paid as they are for action, constantly urge acquirers to pay 20% to 50% premiums over market price for publicly-held businesses. The bankers tell the buyer that the premium is justified for “control value” and for the wonderful things that are going to happen once the acquirer’s CEO takes charge. (What acquisition-hungry manager will challenge *that* assertion?)

A few years later, bankers – bearing straight faces – again appear and just as earnestly urge spinning off the earlier acquisition in order to “unlock shareholder value.” Spin-offs, of course, strip the owning company of its purported “control value” without any compensating payment. The bankers explain that the spun-off company will flourish because its management will be more entrepreneurial, having been freed from the smothering bureaucracy of the parent company. (So much for that talented CEO we met earlier.)

If the divesting company later wishes to reacquire the spun-off operation, it presumably would again be urged by its bankers to pay a hefty “control” premium for the privilege. (Mental “flexibility” of this sort by the banking fraternity has prompted the saying that fees too often lead to transactions rather than transactions leading to fees.)

It’s possible, of course, that someday a spin-off or sale at Berkshire would be required by regulators. Berkshire carried out such a spin-off in 1979, when new regulations for bank holding companies forced us to divest a bank we owned in Rockford, Illinois.

Voluntary spin-offs, though, make no sense for us: We would lose control value, capital-allocation flexibility and, in some cases, important tax advantages. The CEOs who brilliantly run our subsidiaries now would have difficulty in being as effective if running a spun-off operation, given the operating and financial advantages derived from Berkshire's ownership. Moreover, the parent and the spun-off operations, once separated, would likely incur moderately greater costs than existed when they were combined.

* * * * *

Before I depart the subject of spin-offs, let's look at a lesson to be learned from a conglomerate mentioned earlier: LTV. I'll summarize here, but those who enjoy a good financial story should read the piece about Jimmy Ling that ran in the October 1982 issue of *D Magazine*. Look it up on the Internet.

Through a lot of corporate razzle-dazzle, Ling had taken LTV from sales of only \$36 million in 1965 to number 14 on the Fortune 500 list just two years later. Ling, it should be noted, had never displayed any managerial skills. But Charlie told me long ago to never underestimate the man who overestimates himself. And Ling had no peer in that respect.

Ling's strategy, which he labeled "project redeployment," was to buy a large company and then partially spin off its various divisions. In LTV's 1966 annual report, he explained the magic that would follow: "Most importantly, acquisitions must meet the test of the 2 plus 2 equals 5 (or 6) formula." The press, the public and Wall Street loved this sort of talk.

In 1967 Ling bought Wilson & Co., a huge meatpacker that also had interests in golf equipment and pharmaceuticals. Soon after, he split the parent into three businesses, Wilson & Co. (meatpacking), Wilson Sporting Goods and Wilson Pharmaceuticals, each of which was to be partially spun off. These companies quickly became known on Wall Street as Meatball, Golf Ball and Goof Ball.

Soon thereafter, it became clear that, like Icarus, Ling had flown too close to the sun. By the early 1970s, Ling's empire was melting, and he himself had been spun off from LTV . . . that is, *fired*.

Periodically, financial markets will become divorced from reality – you can count on that. More Jimmy Lings will appear. They will look and sound authoritative. The press will hang on their every word. Bankers will fight for their business. What they are saying will recently have "worked." Their early followers will be feeling very clever. Our suggestion: Whatever their line, never forget that 2+2 will always equal 4. And when someone tells you how old-fashioned that math is --- zip up your wallet, take a vacation and come back in a few years to buy stocks at cheap prices.

* * * * *

Today Berkshire possesses (1) an unmatched collection of businesses, most of them now enjoying favorable economic prospects; (2) a cadre of outstanding managers who, with few exceptions, are unusually devoted to both the subsidiary they operate *and* to Berkshire; (3) an extraordinary diversity of earnings, premier financial strength and oceans of liquidity that we will maintain under *all* circumstances; (4) a first-choice ranking among many owners and managers who are contemplating sale of their businesses and (5) in a point related to the preceding item, a culture, distinctive in many ways from that of most large companies, that we have worked 50 years to develop and that is now rock-solid.

These strengths provide us a wonderful foundation on which to build.

The Next 50 Years at Berkshire

Now let's take a look at the road ahead. Bear in mind that if I had attempted 50 years ago to gauge what was coming, certain of my predictions would have been far off the mark. With that warning, I will tell you what I would say to my family today if they asked me about Berkshire's future.

- First and definitely foremost, I believe that the chance of permanent capital loss for patient Berkshire shareholders is as low as can be found among single-company investments. That's because our per-share *intrinsic business value* is almost certain to advance over time.

This cheery prediction comes, however, with an important caution: If an investor's entry point into Berkshire stock is unusually high – at a price, say, approaching double book value, which Berkshire shares have occasionally reached – it may well be many years before the investor can realize a profit. In other words, a sound investment can morph into a rash speculation if it is bought at an elevated price. Berkshire is not exempt from this truth.

Purchases of Berkshire that investors make at a price modestly above the level at which the company would repurchase its shares, however, should produce gains within a reasonable period of time. Berkshire's directors will only authorize repurchases at a price they believe to be *well below* intrinsic value. (In our view, that is an essential criterion for repurchases that is often ignored by other managements.)

For those investors who plan to sell within a year or two after their purchase, I can offer *no* assurances, whatever the entry price. Movements of the general stock market during such abbreviated periods will likely be far more important in determining your results than the concomitant change in the intrinsic value of your Berkshire shares. As Ben Graham said many decades ago: "In the short-term the market is a voting machine; in the long-run it acts as a weighing machine." Occasionally, the voting decisions of investors – amateurs and professionals alike – border on lunacy.

Since I know of no way to reliably predict market movements, I recommend that you purchase Berkshire shares *only* if you expect to hold them for at least five years. Those who seek short-term profits should look elsewhere.

Another warning: Berkshire shares should not be purchased with borrowed money. There have been three times since 1965 when our stock has fallen about 50% from its high point. Someday, something close to this kind of drop will happen again, and no one knows when. Berkshire will almost certainly be a satisfactory holding for *investors*. But it could well be a disastrous choice for speculators employing leverage.

- I believe the chance of any event causing Berkshire to experience financial problems is essentially zero. We will always be prepared for the thousand-year flood; in fact, if it occurs we will be selling life jackets to the unprepared. Berkshire played an important role as a "first responder" during the 2008-2009 meltdown, and we have since more than doubled the strength of our balance sheet and our earnings potential. Your company is the Gibraltar of American business and will remain so.

Financial staying power requires a company to maintain three strengths under *all* circumstances: (1) a large and reliable stream of earnings; (2) massive liquid assets and (3) *no* significant near-term cash requirements. Ignoring that last necessity is what usually leads companies to experience unexpected problems: Too often, CEOs of profitable companies feel they will always be able to refund maturing obligations, however large these are. In 2008-2009, many managements learned how perilous that mindset can be.

Here's how we will *always* stand on the three essentials. First, our earnings stream is huge and comes from a vast array of businesses. Our shareholders now own many large companies that have durable competitive advantages, and we will acquire more of those in the future. Our diversification assures Berkshire's continued profitability, even if a catastrophe causes insurance losses that far exceed any previously experienced.

Next up is cash. At a healthy business, cash is sometimes thought of as something to be minimized – as an unproductive asset that acts as a drag on such markers as return on equity. Cash, though, is to a business as oxygen is to an individual: never thought about when it is present, the only thing in mind when it is absent.

American business provided a case study of that in 2008. In September of that year, many long-prosperous companies suddenly wondered whether their checks would bounce in the days ahead. Overnight, their financial oxygen disappeared.

At Berkshire, our “breathing” went uninterrupted. Indeed, in a three-week period spanning late September and early October, we supplied \$15.6 *billion* of fresh money to American businesses.

We could do that because we always maintain at least \$20 billion – and usually far more – in cash equivalents. And by that we mean U.S. Treasury bills, not other substitutes for cash that are claimed to deliver liquidity and actually do so, *except* when it is truly needed. When bills come due, only cash is legal tender. Don’t leave home without it.

Finally – getting to our third point – we will never engage in operating or investment practices that can result in sudden demands for large sums. That means we will not expose Berkshire to short-term debt maturities of size nor enter into derivative contracts or other business arrangements that could require large collateral calls.

Some years ago, we became a party to certain derivative contracts that we believed were significantly mispriced and that had only minor collateral requirements. These have proved to be quite profitable. Recently, however, newly-written derivative contracts have required full collateralization. And that ended our interest in derivatives, regardless of what profit potential they might offer. We have not, for some years, written these contracts, except for a few needed for operational purposes at our utility businesses.

Moreover, we will not write insurance contracts that give policyholders the right to cash out at their option. Many *life* insurance products contain redemption features that make them susceptible to a “run” in times of extreme panic. Contracts of that sort, however, do not exist in the property-casualty world that we inhabit. If our premium volume should shrink, our float would decline – but only at a very slow pace.

The reason for our conservatism, which may impress some people as extreme, is that it is entirely predictable that people will occasionally panic, but not at all predictable when this will happen. Though practically all days are relatively uneventful, tomorrow is *always* uncertain. (I felt no special apprehension on December 6, 1941 or September 10, 2001.) And if you can’t predict what tomorrow will bring, you must be prepared for whatever it does.

A CEO who is 64 and plans to retire at 65 may have his own special calculus in evaluating risks that have only a tiny chance of happening in a given year. He may, in fact, be “right” 99% of the time. Those odds, however, hold no appeal for us. We will never play financial Russian roulette with the funds you’ve entrusted to us, even if the metaphorical gun has 100 chambers and only one bullet. In our view, it is madness to risk losing what you *need* in pursuing what you simply *desire*.

- Despite our conservatism, I think we will be able *every* year to build the underlying per-share earning power of Berkshire. That does *not* mean operating earnings will increase each year – far from it. The U.S. economy will ebb and flow – though mostly flow – and, when it weakens, so will our current earnings. But we will continue to achieve organic gains, make bolt-on acquisitions and enter new fields. I believe, therefore, that Berkshire will annually add to its *underlying* earning power.

In some years the gains will be substantial, and at other times they will be minor. Markets, competition, and chance will determine when opportunities come our way. Through it all, Berkshire will keep moving forward, powered by the array of solid businesses we now possess and the new companies we will purchase. In most years, moreover, our country’s economy will provide a strong tailwind for business. We are blessed to have the United States as our home field.

- The bad news is that Berkshire’s long-term gains – measured by percentages, not by dollars – cannot be dramatic and *will not come close* to those achieved in the past 50 years. The numbers have become too big. I think Berkshire will outperform the average American company, but our advantage, if any, won’t be great.

Eventually – probably between ten and twenty years from now – Berkshire’s earnings and capital resources will reach a level that will not allow management to intelligently reinvest all of the company’s earnings. At that time our directors will need to determine whether the best method to distribute the excess earnings is through dividends, share repurchases or both. If Berkshire shares are selling below intrinsic business value, massive repurchases will almost certainly be the best choice. You can be comfortable that your directors will make the right decision.

- No company will be more shareholder-minded than Berkshire. For more than 30 years, we have annually reaffirmed our Shareholder Principles (see page 117), always leading off with: “Although our form is corporate, our attitude is partnership.” This covenant with you is etched in stone.

We have an extraordinarily knowledgeable and business-oriented board of directors ready to carry out that promise of partnership. None took the job for the money: In an arrangement almost non-existent elsewhere, our directors are paid only token fees. They receive their rewards instead through ownership of Berkshire shares and the satisfaction that comes from being good stewards of an important enterprise.

The shares that they and their families own – which, in many cases, are worth very substantial sums – were *purchased* in the market (rather than their materializing through options or grants). In addition, unlike almost all other sizable public companies, we carry no directors and officers liability insurance. At Berkshire, directors walk in your shoes.

To further ensure continuation of our culture, I have suggested that my son, Howard, succeed me as a *non-executive* Chairman. My only reason for this wish is to make change easier if the wrong CEO should ever be employed and there occurs a need for the Chairman to move forcefully. I can assure you that this problem has a *very* low probability of arising at Berkshire – likely as low as at any public company. In my service on the boards of nineteen public companies, however, I’ve seen how hard it is to replace a mediocre CEO if that person is also Chairman. (The deed usually gets done, but almost always very late.)

If elected, Howard will receive no pay and will spend no time at the job other than that required of all directors. He will simply be a safety valve to whom any director can go if he or she has concerns about the CEO and wishes to learn if other directors are expressing doubts as well. Should multiple directors be apprehensive, Howard’s chairmanship will allow the matter to be promptly and properly addressed.

- Choosing the right CEO is all-important and is a subject that commands much time at Berkshire board meetings. Managing Berkshire is primarily a job of capital allocation, coupled with the selection and retention of outstanding managers to captain our operating subsidiaries. Obviously, the job also requires the replacement of a subsidiary’s CEO when that is called for. These duties require Berkshire’s CEO to be a rational, calm and decisive individual who has a broad understanding of business and good insights into human behavior. It’s important as well that he knows his limits. (As Tom Watson, Sr. of IBM said, “I’m no genius, but I’m smart in spots and I stay around those spots.”)

Character is crucial: A Berkshire CEO must be “all in” for the company, not for himself. (I’m using male pronouns to avoid awkward wording, but gender should never decide who becomes CEO.) He can’t help but earn money far in excess of any possible need for it. But it’s important that neither ego nor avarice motivate him to reach for pay matching his most lavishly-compensated peers, even if his achievements far exceed theirs. A CEO’s behavior has a huge impact on managers down the line: If it’s clear to them that shareholders’ interests are paramount to him, they will, with few exceptions, also embrace that way of thinking.

My successor will need one other particular strength: the ability to fight off the ABCs of business decay, which are arrogance, bureaucracy and complacency. When these corporate cancers metastasize, even the strongest of companies can falter. The examples available to prove the point are legion, but to maintain friendships I will exhume only cases from the distant past.

In their glory days, General Motors, IBM, Sears Roebuck and U.S. Steel sat atop huge industries. Their strengths seemed unassailable. But the destructive behavior I deplored above eventually led each of them to fall to depths that their CEOs and directors had not long before thought impossible. Their one-time financial strength and their historical earning power proved no defense.

Only a vigilant and determined CEO can ward off such debilitating forces as Berkshire grows ever larger. He must never forget Charlie's plea: "Tell me where I'm going to die, so I'll never go there." If our non-economic values were to be lost, much of Berkshire's economic value would collapse as well. "Tone at the top" will be key to maintaining Berkshire's special culture.

Fortunately, the structure our future CEOs will need to be successful is firmly in place. The extraordinary delegation of authority now existing at Berkshire is the ideal antidote to bureaucracy. In an operating sense, Berkshire is not a giant company but rather a collection of large companies. At headquarters, we have never had a committee nor have we ever required our subsidiaries to submit budgets (though many use them as an important internal tool). We don't have a legal office nor departments that other companies take for granted: human relations, public relations, investor relations, strategy, acquisitions, you name it.

We do, of course, have an active audit function; no sense being a damned fool. To an unusual degree, however, we trust our managers to run their operations with a keen sense of stewardship. After all, they were doing exactly that before we acquired their businesses. With only occasional exceptions, furthermore, our trust produces better results than would be achieved by streams of directives, endless reviews and layers of bureaucracy. Charlie and I try to interact with our managers in a manner consistent with what we would wish for, if the positions were reversed.

- Our directors believe that our future CEOs should come from internal candidates whom the Berkshire board has grown to know well. Our directors also believe that an incoming CEO should be relatively young, so that he or she can have a long run in the job. Berkshire will operate best if its CEOs average well over ten years at the helm. (It's hard to teach a new dog old tricks.) And they are not likely to retire at 65 either (or have you noticed?).

In both Berkshire's business acquisitions and large, tailored investment moves, it is important that our counterparties be both familiar with and feel comfortable with Berkshire's CEO. Developing confidence of that sort and cementing relationships takes time. The payoff, though, can be huge.

Both the board and I believe we now have the right person to succeed me as CEO – a successor ready to assume the job the day after I die or step down. In certain important respects, this person will do a better job than I am doing.

- Investments will always be of great importance to Berkshire and will be handled by several specialists. They will report to the CEO because their investment decisions, in a broad way, will need to be coordinated with Berkshire's operating and acquisition programs. Overall, though, our investment managers will enjoy great autonomy. In this area, too, we are in fine shape for decades to come. Todd Combs and Ted Weschler, each of whom has spent several years on Berkshire's investment team, are first-rate in all respects and can be of particular help to the CEO in evaluating acquisitions.

All told, Berkshire is ideally positioned for life after Charlie and I leave the scene. We have the right people in place – the right directors, managers and prospective successors to those managers. Our culture, furthermore, is embedded throughout their ranks. Our system is also regenerative. To a large degree, both good and bad cultures self-select to perpetuate themselves. For very good reasons, business owners and operating managers with values similar to ours will continue to be attracted to Berkshire as a one-of-a-kind and *permanent* home.

- I would be remiss if I didn't salute another key constituency that makes Berkshire special: our shareholders. Berkshire truly has an owner base unlike that of any other giant corporation. That fact was demonstrated in spades at last year's annual meeting, where the shareholders were offered a proxy resolution:

RESOLVED: Whereas the corporation has more money than it needs and since the owners unlike Warren are not multi billionaires, the board shall consider paying a meaningful annual dividend on the shares.

The sponsoring shareholder of that resolution never showed up at the meeting, so his motion was not officially proposed. Nevertheless, the proxy votes had been tallied, and they were enlightening.

Not surprisingly, the A shares – owned by relatively few shareholders, each with a large economic interest – voted “no” on the dividend question by a margin of 89 to 1.

The remarkable vote was that of our B shareholders. They number in the hundreds of thousands – perhaps even totaling one million – and they voted 660,759,855 “no” and 13,927,026 “yes,” a ratio of about 47 to 1.

Our directors recommended a “no” vote but the company did not otherwise attempt to influence shareholders. Nevertheless, 98% of the shares voting said, in effect, “Don't send us a dividend but instead reinvest all of the earnings.” To have our fellow owners – large and small – be so in sync with our managerial philosophy is both remarkable and rewarding.

I am a lucky fellow to have you as partners.

Warren Buffett with Bill and Melinda Gates (2006)

6/26/2006

Charlie Rose: Warren Buffett, the CEO of Berkshire Hathaway and the second richest man in the world, announced yesterday he is giving much of his \$40-plus billion fortune to the largest and perhaps most admired foundation in history, the Bill and Melinda Gates Foundation. In essence, he is using that foundation to pass his money back to society. It means the foundation, which now spends \$1.5 billion per year on global health, education and libraries, will now spend \$3 billion per year. Think of the consequences for those who are poor, sick and uneducated. It means Bill and Melinda and Warren can make even more real a guiding principle that all lives are equal. It means Warren Buffett joins great names in business history and philanthropy -- Rockefeller, Ford, Carnegie and Gates -- who have given their fortune back to society. Think of the possibilities and you'll understand why this is the most important and historic announcement ever in philanthropy. I am pleased that Warren, Bill and Melinda are making their only television appearance today on this program. Warren is a very good friend and I know and have great respect and affection for Bill and Melinda. Bill and I have done many television interviews before. This is Melinda's first appearance, and I hope not her last. Finally, Carol Loomis, the great business reporter from "Fortune" magazine. She broke the story yesterday in her cover story in "Fortune" magazine. The story is entitled "Warren Buffett Gives It Away." I am pleased to have Warren, Bill and Melinda at this table. Thank you. This is as much of a win-win as I've seen in a long time.

Warren Buffett: Yeah, i doesn't get any better than this.

Charlie Rose: Tell me the significance as you see it of what's happened.

Warren Buffett: Well, it's something I've always planned. My wife Suzy and I planned that whatever I made would go back to society. And originally, I thought she would outlive me and she'd make the big decision on it, the manner. But since her death, I had to rethink the best way to get the money into society and have it used in the most effective way. And I had a solution staring me in the face. And I had seen Bill and Melinda do what they have done with their foundation. You know, they've done it with their own money. They've poured themselves into it. The decisions are great. Their goals are similar to mine. So -- so the time is now.

Charlie Rose: Bill has already given you a book to start reading about all these issues.

Warren Buffett: He gave it to me. There will probably be a quiz after the show.

Charlie Rose: What else do you know about malaria, tuberculosis?

Warren Buffett: I think he wants me to contract all these diseases just so I can work on it.

Charlie Rose: How do you two see the significance of this, for you, for the causes you serve?

Melinda Gates: Well, for us, it's just fantastic, because we look at it as doubling the impact. The diseases we've already been working on and the education and the inequities that we've been looking at for so long just basically doubled by Warren's gift. And it's incredible, the depth that we'll be able to go to on some of these global health issues.

Charlie Rose: Bill?

Bill Gates: Well, it's a huge responsibility. In some ways, if you make mistakes with your own money, you don't feel as bad about it as if it were someone else's. So now we're even more intent on doing it right.

And it's a very exciting time. The advances in medicine and other things we can do to relieve poverty -- we've been making good progress. And with the doubling of resources, we think our impact can even more than double. And so it's thrilling, but it's a huge responsibility.

Charlie Rose: I mentioned that you two believe and the guiding principle has been all lives are equal. What do you mean by that, in terms of how it affects you and how you look at the world?

Bill Gates: Well, it's a pretty simple thing. And it goes back to something Warren talks about, where you can be born anywhere in the world and your opportunities are very different.

Charlie Rose: This is ovarian lottery.

Bill Gates: Yes. And it's not really fair that we could save lives for a few hundred dollars in many countries, and yet we don't. We don't discover the drugs, or even if we have them, we don't get them out there. And it turns out that if you save those lives, that has this incredible effect on reducing population growth, surprisingly, and then you have more resources to have great nutrition and education and get this virtuous cycle going that the richer countries have experienced, and that's an amazing thing. That should happen throughout the world.

Charlie Rose: You mentioned Suzy's death made you begin to think about it because she was not going to outlive you and run the Buffett Foundation. Tell me about what led up to this? I mean, was this sort of you went to Bill and said, I've decided what I want to do? Were there a series of conversations? How did it unfold?

Warren Buffett: Well, I began to mull the various possibilities. And I wanted the money to be used effectively. And I've looked at a lot of foundations, Charlie. And there are a number that I admire, but there are none that are in the same class, in my view, as the Bill and Melinda Gates Foundation. And not just because of size. They really have looked at the world without regard to gender, color, religion, geography, and they said, how can we do the most good for the most people, and particularly the people that have gotten the short straws in life? And so, I mentioned that I was thinking about it to Bill many, many months ago. But I still was playing around in my mind the best way to do it, because I wanted something that would work well for the Berkshire Hathaway shareholders as well as for the people who are going to be the beneficiaries of the money. And finally, I came up with this plan. And when I decide on something, you know, I'm ready to go.

Charlie Rose: Truer words have never been spoken.

Melinda Gates: True.

Charlie Rose: So when you first heard this, what was your response? What did you think?

Melinda Gates: When I first heard it, it's something that's very hard to believe, that it might actually happen. But immediately turned for us to the responsibility. You know, when you give away your own money, you feel incredibly responsible as you do that. And then we look at you say, this is the body of Warren's work for his life, you feel I think doubly responsible giving away somebody else's money. And then I think immediately, we turn from that and say, OK, what can be done for the world? What can be done for good? And it's just an awesome thing to be able to think about the number of people that you could lift out of poverty with a gift like this.

Charlie Rose: Were there any issues that came up, Bill, in terms of the mechanics of this, how you do this? I mean, Warren had decided that he was going to give to five foundations, five-sixths of it going to Bill and Melinda Gates Foundation. Any logistics here that you had to overcome?

Bill Gates: Well, in the last few months, we probably paid some lawyers' bills to make sure we've got it structured the right way. But, you know, in the end, even though there's some paperwork and some of that, it's really pretty simple. One other thing that we're thrilled about is Warren's joining us as a trustee, and so there will be three trustees of the foundation. And that will be a great addition for us.

Warren Buffett: But that was not a condition of the gift, Charlie. I'd be totally happy if -- well, and the two of them are going to be running it. But --

Bill Gates: And we would have been happy to have Warren as a trustee without the gift.

Melinda Gates: Yes, exactly. That's how it turns out.

Charlie Rose: And the idea, the only condition of this is if something happens to them, if a plane goes down, as you have said, then what?

Warren Buffett: Well, that's a very, very low probability, but if they weren't available to run it, I would want to take a look at what the ongoing situation was going to be.

Charlie Rose: Take a fresh look.

Warren Buffett: Yes, take a fresh look. Doesn't mean I wouldn't be doing the same thing, but I just -- I am doing this because I have seen two extraordinarily talented people apply themselves big time to the major problems of the world. And I would want to -- I would want to see what was going to be the next act if that happened, but it isn't going to happen.

Charlie Rose: There is also this, a selfless act. I mean, didn't you have any great desire to see the Buffett Foundation and the Buffett Library and the Buffett this and Buffett that?

Warren Buffett: No. No. I like the Omaha public library.

Charlie Rose: What will be your role then? I mean, you will be a trustee, but will you sort of what?

Warren Buffett: If I have any ideas, they can use me as a sounding board. They can use me anyway they want to use me.

Charlie Rose: They're already doing that.

Warren Buffett: Well, that's true. And so, really it's not a big deal. But any time I can be helpful, fine. I won't get involved in their investments. That complicates life. So I'm totally out of that game.

Charlie Rose: Are their priorities your priorities?

Warren Buffett: Yes, overwhelmingly they mesh, yes. I wouldn't be doing it otherwise.

Charlie Rose: And you have the Susan Thompson Foundation looking at other issues.

Warren Buffett: Right.

Charlie Rose: And the kids have foundations, which are involved in a range of issues.

Warren Buffett: But I've seen what they're interested in. And I've seen the way they pour themselves into it. Bill gave a presentation at the Rainbarder (ph) in 2001, it was right after 9/11, and it was one of the best talks I've ever heard. I really wish I had had it on tape. And I've encouraged him to go on with Bill Moyers later on. I mean, it blew us all away. There were 40 or 50 of us there. And when you see a couple

of outstanding minds, you know, passionate about doing something that's in sync with what you would like to see done, you know, that's a no-brainer.

Charlie Rose: You described the brains as ungodly.

Warren Buffett: Right, right.

Charlie Rose: The idea of what impact this has, will it change priorities? Will it change obviously the size of the staff? Will it change -- will you be able to do things that you couldn't before?

Bill Gates: Absolutely. In some ways, we have the challenge of success. That is, every time we get a new drug, then you have a much bigger problem of how do you get it distributed? How do you make sure it has the impact you have in mind? I mean, if you look at the top 20 diseases, there's at least 10 of those we're making very good progress and can expect in the next five to 10 years to have solutions. And so scaling up is very important. In education, as you get one high school that's working well that's a model, you'd like to see that spread throughout the country. And so what we've got here is the opportunity now to really deepen and accelerate. We'll add some things that relate to poverty, but the top goal being going after the health and poverty issues, and then education is the second. That's not going to change.

Charlie Rose: You have found that, in fact, if you can change health, it will have an impact on how many children people have. It will have an impact on a whole range of other things beyond their health.

Melinda Gates: Absolutely. And I think what this allows us to do is deepen what we do in health. So where we're already working on medicines for malaria or tuberculosis vaccine or an AIDS vaccine, we can also start to surround those programs. You can't give somebody medicine if they don't have any food in their belly to eat, or if they don't have clean water. And so looking at some issues around, say, agriculture, to help small farmers in Africa, give them drought resistant seeds for sorghum or help them get seeds that if there's a virus in their banana, doesn't spread from crop year to year, help them get their products to market and have more information. Helping them figure out ways that they can have clean water or healthy food to lift their family up, while we're also starting to solve some of these diseases I think is how we'll deepen the impact of what we're doing in health.

Charlie Rose: Is there and has there been any kind of dilemma between spending money in terms of the future, as you did with the grand challenge, and spending money today in terms of the logistics of getting existing drugs to people?

Bill Gates: Absolutely. I mean, we have finite resources, and there's a very healthy dialogue that goes on, where some say, hey, you ought to spend more on the immediate solutions, and others say, no, you're kind of unique in being willing to fund the research, and so you should focus more on that. And that's great. Having that ongoing dialogue, people who disagree with this, getting the advisers to come in on those issues is very helpful. Take AIDS as an example. Spending money on prevention has this incredible impact, because every case you prevent prevents the cases that might have caused. But then you see the face of the tragedy, the people who are getting ill, and you want to have treatment getting to them as well. And so these problems are big problems that can absorb huge amounts of money. And in fact, that's why we need to work with governments and make sure they get involved. We've been very pleased to see many governments around the world step up and do more in this area of global health.

Melinda Gates: And I think sometimes we also look for, is there a model project that we can do to prove something out, that then can be taken to scale in other places. So we got in early with antiretrovirals in Botswana, knowing that we couldn't possibly give antiretrovirals to everybody in Africa that needs them, but if we could prove out that a country could really do it when it wasn't being done. So we got into that

in 1999 with Merck. We each put in \$50 million. And the first time Bill and I went to visit Botswana, even in 2003 there were only about 3,000 people even then with our program on antiretrovirals. But now we've taken that where you've got 62,000 people in the country on antiretrovirals, and it was a model program. So then, when the government money, the PEPFAR money came in from U.S. government, that could be expanded in other countries. So a lot of times we'll go in that way.

Charlie Rose: And the research in terms of all of these things is an ongoing huge commitment in terms of the payoff coming down the road? In terms of -- you mentioned the 20 diseases. Give me a sense of what diseases that you think we're around the corner from dramatic differences? Malaria, TB, HIV?

Bill Gates: Then there's a series of diarrheal diseases, including rotavirus that we have a new vaccine for. And other -- two other causes of diarrhea. So that's the biggest -- the two biggest killers of kids under 5 are diarrhea and respiratory disease. And we see that we can get through about five different vaccines, drastically eliminate those deaths. Over 10 million children a year die, and those are the top two causes. And so the top five -- AIDS, TB, malaria and those two childhood causes -- we're making great progress there. The other 15, like visceral leishmaniasis, are less known because they're only in the --

Charlie Rose: And less pronounceable.

Bill Gates: -- tropical areas.

Warren Buffett: He's going to be my family doctor, Charlie. I want him in the operating room.

Charlie Rose: You're an expert on tropical diseases, too. The idea of what they are doing, was it important to you to be able to make this philanthropic gift and have it pay off immediately?

Warren Buffett: Well, you certainly want it to be used intelligently immediately. The payoffs don't necessarily come that fast. And frankly, that's why they will be a lot better at this than I am. I like immediate feedback. I'm the kind of guy, if I walk in the ice cream store I want a triple-dipper right there. So you know -- -- and really (inaudible), you have to have a longer view than that. You have to take delayed results in many cases. Now, they're going to be impatient to get the best results they can, but it's a different game in that respect. And they're very well suited for it.

Charlie Rose: You weren't convinced that you would be good at philanthropy, were you?

Warren Buffett: I think I'd be terrible at it.

Charlie Rose: Why?

Warren Buffett: Well, A --

Charlie Rose: Other than the fact --

Warren Buffett: -- I like the fast feedback. But secondly, it probably requires answering to a bigger constituency, in a sense, than I like doing. I like to look in the mirror and ask myself whether I'm doing OK. You know? And there are a lot of people whose opinions I really don't want to listen to, you know. So you have to be a little more diplomatic perhaps than I am. And you know, I'm just delighted, Charlie, you know, as I said in that article, I mean, if you've got something important in life to do -- let's say I was going to play the golf match of my life, you know -- and I could get somebody to substitute for me like Tiger Woods, I would do it any time. And if I had to sing on television, you know, and I could just mouth the words and get Sinatra in the back room doing it for me, I'd do it. So the idea that you have to -- you

have various responsibilities in this world, and this money is a responsibility, but if you can get somebody better at doing something that needs to be done in your place, you know, I'm used to that.

Charlie Rose: People have been speculating, as you know, for a long time about why you haven't done this before. And you were saying you haven't done it before -- Suzy's death was one thing. What else?

Warren Buffett: Well, the big -- if you go all the way back, Charlie, I mean, Suzy and I decided when we were in our 20s that the money would go back to society.

Charlie Rose: When you told her you were going to be rich. One thing you could be sure of.

Warren Buffett: I was sure of it. She thought I was delusional. But as time went along, I've managed to convince her. But you know, it was always going to society. There wasn't any question about that. Now, my logic -- but it also went down the grate of what I wanted to do -- but my logic was that philanthropic needs would be huge today, tomorrow, 20 years from now, 100 years from now. And if people were going to devote their money to philanthropy, the ones who were high compounders should take care of the philanthropy 20 or 40 years out.

Charlie Rose: That would be you.

Warren Buffett: Yes, I really thought, you know, it made way more sense than to give \$1 million 30 years ago, which might have been all I would have had available, to have it compound. And people who were low compounders should take care of the current needs. I mean, if I ran a university and I had two wealthy alumni and they were going to supply all the money, I would take the guy who wasn't going to do much with the money and use his money currently, and I would have the other fellow compound for me. So anyway, it was a convenient way to think anyway. And you know, that has been my philosophy on it, but now is the time.

Charlie Rose: Do you think people are surprised you did this?

Warren Buffett: Probably, yes.

Charlie Rose: When you made this decision, you had to ask yourself, will there be consequences for this extraordinarily compounding that has been taking place? And will it affect Berkshire Hathaway stockholders?

Warren Buffett: Yes. And I don't think it will one iota. As a matter of fact, 31 percent of the money that Berkshire Hathaway makes, if we can make another \$100 million, 31 percent of it through my shares is going to philanthropy. So if there's any -- if you could have a greater motivation than I've had over the years -- I'm not sure you could -- but I would have it now. It's a great feeling to know that as the company becomes worth more and more money, that it actually translates into something good for people around the world.

Charlie Rose: So people put this value on it. You, just for the benefit of the audience, the Gates -- Bill and Melinda Gates Foundation, about \$30 billion, something thereabouts?

Warren Buffett: That stock is committed, and in terms of present market value it would be about \$30 billion.

Charlie Rose: What you were doing is committing about \$37 billion based on the value of shares today.

Warren Buffett: Today.

Charlie Rose: \$37 billion.

Warren Buffett: Right.

Charlie Rose: It will be given -- it starts immediately, in 2006.

Warren Buffett: Right.

Charlie Rose: It will be given over a period of years.

Warren Buffett: It will be given indefinitely, in a sense. I mean, and to the extent that Berkshire becomes more valuable, which I think it will -- -- it can be a lot bigger than \$37 billion over time, and I think it will be. And you know, the bigger the better. It can be going on 20, 30 or 40 years from now.

Charlie Rose: Bill and Melinda will agree on this point. I know of no one who loves his work more than this guy here.

Melinda Gates: Absolutely.

Charlie Rose: He loves to tap dance to work, as he says. That will continue.

Warren Buffett: Yes.

Charlie Rose: You'll go back to Omaha and tap dance to work, and make these decisions, now knowing that you are not only benefiting the Berkshire shareholders but also people's lives far away.

Warren Buffett: I knew it would benefit philanthropy eventually, but now it's very tangible.

Charlie Rose: It's tangible.

Warren Buffett: It's very tangible. And every year, I hope those shares that are committed to go that year are worth more money. And over time, you know, I think they will be. So this can be a lot bigger. And it's up to me to work to make it so.

Charlie Rose: But you do get great satisfaction from the fact that you now have made this decision and you know where it's going.

Warren Buffett: Yes, absolutely, Charlie. I mean, it's the second act of the money, you know, basically. You amass these claim checks, in effect, which money is, on society, and then you figure out the best use for them.

Charlie Rose: All right. How is your role going to change at all? Bill announced about a month ago that you were giving up chief software architect at Microsoft, leaving executive responsibilities, although you remain and will remain as chairman. Does that mean that your role at the Bill and Melinda Gates Foundation will change?

Bill Gates: Yes. I will, in June 2008, I'll switch and become full-time at the foundation. And that was actually developing in parallel with Warren's thinking --

Charlie Rose: But not connected?

Bill Gates: -- and they're unrelated. They're actually somewhat synergistic. That is, it's thrilling that as I'm going to full time, that the scope of the resources have been expanded, more than doubled, because of what Warren has done. And my role is to help us learn. Melinda and I both travel quite a bit. I'll get to go to a lot more schools, a lot more of those trips, read more of these long health books. Patty Stonecipher,

who runs the foundation, has done a fantastic job and has been thinking about this scaling up, how we grow the staff and yet keep the efficiency that we all believe in. And so I'll be helping with strategy far more than I've been able to.

Charlie Rose: So rather than one day a month, you're now going to have measured assistant-partner a lot more.

Melinda Gates: It's going to be great. We love doing this work together.

Charlie Rose: What ought to be said -- and Warren has reminded me of this in every conversation we've ever had -- this is named the Bill and Melinda Gates Foundation for a very good reason, in terms of her involvement in this from the get-go. You know, what do you do and how is it divided between, and how will this evolve in terms of you two as trustees and sort of the -- make all the decisions and set the vision, along with the people who execute it?

Melinda Gates: Well, I think you're using the right word, which is evolve, which is how our roles have evolved over the last 10 years that we've been at this together. I mean, I think it's hard to predict exactly how much time you're going to spend on something, but Bill spent more and more time over the years. I've had a bit more time, obviously, because I don't have a full-time career. Our kids are getting to where they're all at sort of school age now. But you know, I think it gives us more time to travel together. I think it really gives you a depth to the work, when you can go out to Bangladesh and be in the slums, go out to India and be there, be with the people in Africa. It gives you a real depth to understand what are the issues they're facing. There is an incredible program already in tuberculosis, that has been going on for a long time, where every day for six months if you're trying to be treated for tuberculosis, they give you a pill. So I was out in Zambia and saw this going on recently. But you know, you stand back and you ask the question, well, six months every day coming in and standing in line for two hours to get your pill with no food in your belly, that's not a successful health program. So sometimes I think you have to actually be on the ground to understand what those numbers mean. And we're already looking at how do you cut that time in half and how do you ultimately get a vaccine. But I think those are the types of trips and the types of discussion that enrich the flavor of what we do together. And today, when I come back from a trip or when we're on a trip together, we just have a whole another level of discussion about where we want to go and how we want to deepen the work.

Charlie Rose: Many people believe that because of business techniques -- demanding results, setting goals and making sure that they are met -- that you guys have introduced something new to philanthropy and -- as a model. Tell me how you think the Bill and Melinda Gates Foundation is different, or how you believe its guiding principles ought to be.

Bill Gates: Well, I think there is something to be said for being incredibly results-oriented and having the kind of optimism that if you bring great people together and set very ambitious goals, amazing things can happen. I don't think that's totally new. I think you can go back to Rockefeller --

Charlie Rose: Rockefeller, yes.

Bill Gates: -- and say he was willing to go against conventional wisdom. He was willing to take on very tough problems. You know, again and again we find things where the Rockefeller Foundation was doing it right.

Melinda Gates: Absolutely.

Bill Gates: The philosophy that Carnegie had in "The Gospel of Wealth." Warren handed that out at a get-together we had, and you know, it really helped me think about philanthropy, and, you know, how you ought to set very high goals.

Charlie Rose: This is before you created the foundation?

Bill Gates: That's right. The whole idea -- -- the whole idea that -- that leaving the wealth to your children would actually not be the best idea for society or for them, that came out of some things that Warren was talking about right around the time we met him. I was starting to think, oh, geez, this is a problem I'll have to deal with. Here is some very good advice about that. And now, here we are. But I do think energy and pulling people together the right way, getting partners to work together in new ways, it's what's allowed us to move as fast as we have.

Warren Buffett: Charlie, I've had -- in business, I had a great partnership with my partner, Charlie Munger. And I've seen what happens when you get two people together that, you know, that are totally in sync but also have different ways of looking at things but are working toward a common goal. And you could not have a better pair than Bill and Melinda running a foundation.

Charlie Rose: Which -- I wonder, do you think he'll be drawn into this and his involvement will deepen?

Bill Gates: A little bit, yes. I think Warren would be an incredible philanthropist, but he loves his job. And that's what he's going to do full time.

Charlie Rose: I know. But you love your job and you have misgivings about leaving Microsoft.

Bill Gates: No, I do. This is a tough one. It's unusual to have two things that you love and that you think are important and challenging. And so I've had this debate for several years, and I wanted to be very explicit about the change, and I don't even know what it will be like but I'm very excited about it. And this just reinforces the importance of having that time and spending it well. But we had Warren at a discussion about microfinance about a month ago, and it was great talking with these bankers, and Warren was asking about their costs and did people repay the loans. And so we're going to draw him in a little bit. We'll do our best.

Charlie Rose: I'll bet. You have said it famously about children, your own children, who you've done wonderful things and created foundations for them --

Warren Buffett: I'm very proud of them.

Charlie Rose: Exactly. You're very proud of them. And they feel the same way about you. That you wanted to leave them enough money so they could do whatever they wanted to do, but not do nothing.

Warren Buffett: Yes. They can do anything but not nothing. And I don't believe in dynastic wealth. I mean, if you contrast -- it's nice to leave something to the kids. And I mean, I can understand a person who wants to leave their farm or a small business they built and all of that to their children, but dynastic wealth, the idea that many generations should be able to go without doing a thing if they wish, simply because they came from the right womb, I mean that really strikes me as flying in the face of really what this country is about. I mean, we believe in a meritocracy and equality of opportunity. And dynastic wealth flies in the face of that. So I've really felt that if you have a choice between having a foundation like this doing tremendous things for people all over the world, or having a bunch of people, you know, as they say, that came from the lucky sperm club --

Charlie Rose: The ovarian lottery. Now, you've mentioned Charlie Munger. You called him up and said, I'm thinking about doing this. What was his reaction?

Warren Buffett: He said, "you finally had a good idea." I've been waiting for that for years.

Charlie Rose: Did he really?

Warren Buffett: It took me 40 years to get that out of him, but I finally did.

Charlie Rose: One good idea.

Warren Buffett: Yes, one good idea. He's not expecting another one.

Charlie Rose: But he believed in it and said this is the right thing.

Warren Buffett: Oh, he loved it. Yes, sure.

Charlie Rose: The idea that Warren got you to start thinking about philanthropy, then in 1993, you know, or '94 you read this report, world development report. Tell me what that said to you that seems to be linked to everything you have done since then?

Bill Gates: Well, before I read that, I thought that the world was really prioritizing how money was spent so it would go after these inexpensive ways of saving lives, and that there wouldn't be a disease I never heard of that was killing over half million children a year, rotavirus. And that if there were, all the drugs companies would be working on it. And so this fact that when people are so poor they can't afford the medicines, so nobody works to create those medicines and you have diseases that aren't in the rich world so you don't get the trickle-down benefit that you're solving it for the rich and therefore eventually it gets to the poor, I hadn't known that. And --

Charlie Rose: If you didn't know this fact, and so therefore --

Bill Gates: Right. I thought that coming into philanthropy, all the really important stuff would already be addressed, and so it would just be on the margin what could be done. And you'd have to struggle to find something really impactful. But once I read that report I said, hey, there is something here -- actually a tragedy that it's not addressed, but in terms of being the key priority that we could put our energies into and go after. It just jumped out at me.

Warren Buffett: Charlie, Bill and I sort of have a background mind-set of a market system. And a market system works awfully well. It's worked well in this country. But a market system has not worked in terms of people, poor people around the world, with something -- with a disease that should be available for just peanuts --

Charlie Rose: It doesn't work because people can't afford to participate.

Warren Buffett: Yes, the market system just fails in that case. And you have to interject yourself into that, and make sure there is a system that will deliver. I'm a big believer in the market system 95 percent of the time, but -- it's done pretty well for me. And the world, absolutely. But there are things where the market system is not going to solve the problem. And that's where Bill came in on this.

Charlie Rose: You have said to me in other conversations, you know, that when you were thinking about what foundation you might be involved in, not in terms of choosing one but in terms of what your money might -- that you wanted to choose things that had perhaps been neglected.

Warren Buffett: Yes. If the money is pouring into something and talent, you know, there's really no reason to duplicate it. There's millions of good things to do in the world. And you're looking for something that's important. You're looking for something that you'd be reasonably good at in terms of implementing any ideas that do come to mind, and you're looking for something that really needs more funding. And that's exactly the way that Bill and Melinda have come at the problem.

Charlie Rose: You know who, Bill, would -- and Melinda, you can certainly speak to this -- who would love this is Suzy. I mean, the idea of what you have done.

Warren Buffett: Yes.

Charlie Rose: Because she said to me, you know, I'm always wanting him to do more.

Warren Buffett: Right. Yes, yes. I was not holding her back --

Charlie Rose: Holding her back from speaking her mind or from giving away.

Warren Buffett: No, her -- no one could have had better instincts about doing it. And she would have liked to have started much sooner, as soon as it could be done on a good scale. And I wouldn't quarrel with that. I mean, she saw people one at a time and she saw them with needs now. And she was hit by that, obviously. I mean, I don't disagree with that -- it was perfectly natural for her to react that way. And if she -- if I died when I was 60 or something, there had been a lot of money then, I mean, she would have really gone to town with it.

Charlie Rose: And you would have been pleased that she would be running the foundation --

Warren Buffett: Absolutely. Absolutely.

Charlie Rose: -- dedicated to that.

Warren Buffett: Absolutely.

Melinda Gates: She cared a lot about -- about these issues. I mean, she talked enormously about women lifting themselves up in their situation, and particularly having access and tools to family planning was something she was very interested in. And she traveled extensively, especially to Vietnam and a lot of places in Southeast Asia. So she cared a lot about these inequities. And I keep thinking how pleased she would be that Warren made this decision.

Charlie Rose: Yes. And reproductive rights and parenthood and all these kinds of issues.

Melinda Gates: Absolutely.

Charlie Rose: What are the things that you're not doing, not beyond the things we've talked about, where you know there is an important issue out there or an important cause, that you haven't been able to get to, simply because you've been too busy with your own priorities right now?

Melinda Gates: Yes, well, I wouldn't say that it's because we're too busy. We chose at first to focus on the greatest need, where we saw these medicines could help or vaccines could help, but one of the things we've known that had also been on the back of our minds for some time is the more you travel around the world and meet these people who need the medicines, they're living in slums. I mean, the greatest amount of population growth is going to come in the cities in these countries. And so when you go to slums, there's a whole variation of what those look like, from ones that have absolutely no clean running water, no sanitation, no streets -- you know, the houses are made of reeds -- to ones that actually are getting

somewhat sophisticated, where they've built a latrine or they've got trash services or they might have a little bit of a paved road. So looking at how you can plan for that population group and getting the governments to start thinking about it so they'd put some infrastructure in place so that when people move into those cities and they are living on less than \$2 a day, that there's some place that they can go to actually have basic services.

Charlie Rose: Do you feel some urgency now, because, one, you're spending more time, B, you've got more resources, more in your arsenal as you have said, to do more with respect to governments? Because you have access to every head of state in the world, I'm sure, to get them more involved, because there are things, notwithstanding this edition, that in terms of sustaining impact, you're going to need other people to step up.

Bill Gates: Absolutely. And the last three years have been good. The United States under President Bush has stepped up with AIDS money under the PEPFAR program. A number of European governments, led by the U.K., but with France and others, have stepped up and given more money to vaccines. Norway also doing a great job there. And we need to keep that going. Bono has been a great partner in getting that dialogue going and creating the visibility. In fact, Warren and I called him up and gave him the news of what was going on.

Charlie Rose: This was last night or a week ago or --

Warren Buffett: Yesterday afternoon.

Bill Gates: Right after the story came out --

Charlie Rose: -- another possible leak. Go ahead. So you called him up and --

Bill Gates: Getting governments, the rich world governments more engaged in these issues in the right way, and then getting the developing world governments to have these priorities and get the infrastructure in place. That will make a big difference in how effective we are. We have to do that. And we're going to get more time to focus on that.

Charlie Rose: And treat it with more urgency. How much corruption is there in the delivery of health care to the poorest among us in the most difficult countries?

Bill Gates: Well, in fact, some things like building roads or building a dam, things like that, you end up with a lot of layers that lend themselves to diverting the money. With vaccines, it's not -- it's easier to have transparency. Nobody likes to horde them, because you don't need that many.

Charlie Rose: And you have to refrigerate them and all that.

Bill Gates: And being able to go out and check if they were actually delivered, to check the coverage is relatively straightforward. So we have to be vigilant on this. There's always going to be things like, you know, the jeeps that got bought and where did they end up? And -- but it's a simpler system than most development, and therefore we ought to be able to make sure that 95 percent of it gets exactly to where it should go. There is going to be a little bit of leakage, but in fact, if you're not comfortable with that, you shouldn't --

Charlie Rose: If you don't recognize leakage, that's it. You hope in what way this will in a sense spur other wealthy people?

Warren Buffett: Well, it's an interesting thing, Charlie. When people are thinking about amassing wealth, they frequently go to somebody else that they think knows more about it than they do and join in. I mean, 50 years ago -- 50 years ago last month I started a partnership, and seven people gave me \$105,000. Now, why did they do that? They thought that I would be better at accumulating money for them than they could themselves.

Charlie Rose: Good bet.

Warren Buffett: Well, good bet, it worked out OK. But why not apply that same thinking when you're eventually dispersing wealth? I mean, the idea that your old business cronies or some local pals at the country club or whomever, or even a professional staff that may take over the agenda, the idea that you can't also apply that same theory of getting people that are better than you are at doing something in dispersing wealth as well as amassing wealth, I think it's sort of obvious. So I would hope that people even of modest means that don't have something specific that they really want to do -- and if they have something specific, God bless them, if they have their alma mater or whatever -- but if they are really sort of groping for what to do with far more money maybe than they ever anticipated that they would have, they can look around. Doesn't have to be the Gates Foundation at all. But they should look around for somebody that they think will do the job better than they can do it themselves, that has somewhat similar goals, and turn the money over to them. I think it makes nothing but sense.

Charlie Rose: One thing that the Gates Foundation does that many people may not know about is that you create partners where people not willing to take, they can't, A, because they're in a market system, pharmaceutical companies, or perhaps governments, because they can't take the first step.

Melinda Gates: Right.

Charlie Rose: Tell me how that works.

Melinda Gates: Well, I'll give you an example maybe that will highlight this. There's an organization that we work with called the Institute for One World Health. There's a disease that affects a lot of people, about 200,000 people, primarily in certain states in India and Bangladesh. And this institute for One World Health had seen this drug that had been proven that they thought it worked in one place in Africa. But the drug was 50 years old. It had been created in Italy. There was only one lab in Malta that still was working on it. And they said, look, if we could really do the final stage trials of this drug and prove out that it could work on this disease, kalaazar, visceral leishmaniasis, and really get it out there, we could save a lot of lives. And so we've worked with them to help them finish the trials. Now we're helping them push it through the regulatory body in India, which takes a whole another set of learning and infrastructure to do. And then ultimately we'll actually go with the David and Lucile Packard Foundation, having an organization they work with called Genani (ph) that actually can distribute drugs out in these particular states, in this place in Bangladesh. And so we'll work through them to get the drug distributed out. So that's an example of how we took something where there really is no market for that at all in the developed world, but in the developing world it's a horrible parasitic disease that lots of people die from. And so we're going to help get that out to the people that need it, through those different organizations.

Charlie Rose: Is there much sharing of information among foundations and at the highest levels of people that are doing research on important subjects?

Bill Gates: Absolutely.

Charlie Rose: Unlike the software business.

Bill Gates: Yes, there's no rivalry, really. We're all going after the same thing. And you know, we don't do any science ourselves. You mentioned pharmaceutical companies. Well, they know how to create drugs and test drugs. And so for example, GlaxoSmithKline, GSK, has been one of our partners, where we're using their expertise, but we provide the financial resources so that they can turn to their shareholders and say, hey, this is responsible. We're doing retroviral (ph) drugs, and the resources are here for us to apply ourselves to malaria, which is one of our great partnerships with them. So in a sense, we're just a small piece of the puzzle. It's these partnerships that we create that really do all the work.

Charlie Rose: That provide the kind of manpower and money that you need for the future. Do you have any idea how many lives the work of the Gates Foundation has saved? What do people tell you about children that are alive today that might not have been otherwise?

Melinda Gates: Well particularly the easiest place to measure that is in the vaccine work. I mean, we got into that work early in 1998, 1999, and we made a large commitment to this global alliance or vaccine initiative that we actually helped create. And we got other governments to come into it.

Charlie Rose: Which has been the biggest recipient of your funds.

Melinda Gates: Exactly. We gave them \$750 million initially. And we went back just this year and announced -- or in 2005, announced another \$750 million grant over another 10 years. So we've gotten rich governments to come into that fund, and then 75 of these developing world governments come and apply for the money. But when you look at the vaccines that are out there, we know -- we think we know that 1.7 million lives have been saved just by children getting the basic vaccines that we take for granted in our country. Diphtheria, tetanus and pertussis is something every mother in the U.S. goes and gets for her child when they're under the age of 1. That, getting out some of the new vaccines, HIB, yellow fever. Those are all things that we're getting in the hands of children. So you can measure it in that way. And they estimate over the 10-year life of this thing, I think that we'll save about 10 million children's lives via those vaccines.

Charlie Rose: Ten million.

Melinda Gates: Yes.

Charlie Rose: That says it all, doesn't it?

Warren Buffett: (inaudible).

Charlie Rose: It does. Is this part of what drew you away from something you loved to where you will spend the rest of your life -- you're 50 years old. You're 75.

Warren Buffett: I've noticed.

Charlie Rose: Well, Carol Loomis' first question, she said, are you ill? Are you doing this because you're ill?

Warren Buffett: I'm in amazing health, I mean, considering the fact how I eat. I can't believe it.

Charlie Rose: Ice cream and Coca-Cola.

Warren Buffett: Absolutely, but it works.

Charlie Rose: Is the fact that you can save lives something that you never imagined when you were in, you know, as you have said, 24/7 I was a, would you say, I was a -- eyes down, software guy?

Bill Gates: Well, doing software is a phenomenally fun thing, and the empowerment it provides, that, you know, that I'll love and I'll always keep a connection to that. But as you say, for the rest of my life, starting two years from now, my full-time work is going to be this foundation. And it's thrilling, because I meet brilliant people. I give them a little bit of optimism, show them maybe a path they might not have seen. Go out in the field, see the setbacks, try and figure out a way around those. I get to work with Melinda, my dad, Patty Stonecipher, just incredible people. And so, you know, I'm doubly blessed to have had the work at Microsoft and now this foundation work. When we described to a friend what Warren was doing, you know, we were saying, wow, this is an amazing thing that the two of you met and that this could come together. And they acted like it was almost obvious that this would happen. I have to say, to me it wasn't. I mean, when Warren first mentioned it, it was like, wow, is he serious about that? Wow. Are we ready for that? And it's only hitting me today. I mean, this is the day Warren is going to actually sign -- sign these letters.

Charlie Rose: But how long ago was that, though, Bill? Do you remember? He first mentioned it to you?

Bill Gates: Over the last year-and-a-half or so, he mentioned it. At first, it was, you know, kind of in passing, just a very nice thing that, gosh, your foundation is doing well. And we'd have that ongoing dialogue. It was in the last few months that it was clear he was getting very serious. And with Warren, once he decides something, it's very crisp.

Charlie Rose: The other thing I know about you, once you make a decision, you don't look back. You have not lost one moment of sleep, because I might be doing the wrong thing. I might, maybe, maybe, maybe, maybe. Nothing.

Warren Buffett: Nothing.

Charlie Rose: Do you wish you had done this earlier?

Warren Buffett: No, I really don't. I think this is the right time.

Charlie Rose: This is the right time to do it.

Warren Buffett: Yes, I do, Charlie, yes. You know, I've had a good chance to see what they've done. I feel Berkshire's position better than ever for the future. One thing about it, if I had given the stock in a lump amount, there might be people who'd say that they were too concentrated in one stock and that sort of thing. Well, I want the well-being of their foundation to be sort of concentrated in Berkshire, because I think it's going to do very well. So I wouldn't want them to be forced to sell it and you know, buy government bonds or something of the sort. So this way, I think -- I don't see how it can be any better.

Charlie Rose: So they're sitting on stock and may or may not have to cash in the stock.

Warren Buffett: Well, yes, but they'll tend to cash in the stock as it comes, as will the other foundations. But I've got --

Charlie Rose: To raise money --

Warren Buffett: -- all the years ahead to make the stock more valuable, which is, you know, I've always wanted to do anyway, obviously, but it will be even more fun now.

Charlie Rose: But -- I'm coming back to another point. How will this change your life day to day?

Warren Buffett: Zero.

Charlie Rose: Zero.

Warren Buffett: Yes.

Charlie Rose: You'll go back to Omaha and you tap dance to work --

Warren Buffett: That's right.

Charlie Rose: You get on the phone -- Bill once said to me, you do three things. You talk on the phone. You read. You play bridge. And then watching the cable television show you like.

Warren Buffett: What else is there in life?

Charlie Rose: Well, I'll tell you what else there is in life. There is the satisfaction to know and to see that you can, while you are alive, not when you're dead and not among executors, that you can do something that you can see, because it's already taking place. Changing lives.

Warren Buffett: And see it getting done right.

Charlie Rose: The accommodation. Yes. The idea of what you have done, has it changed your thinking since you began this? In 1994, was it?

Bill Gates: Yes, absolutely. Every year, and we're going to go on learning. You know, in philanthropy, to make sure you're spending the money right is harder. You don't get a market response quite the same way. And so you're going to do things wrong. And you're dealing with partnerships and incentive systems, and so there's a lot of choices that you have to make. For example, when we started out, we didn't think of having a dialogue with governments, because we weren't sure enough about what we were doing to be able to go and say, look, put more money into vaccines, put more money into AIDS. And it was four or five years into it that we started to say, wow, even our resources are small enough that we're going to have to have advocacy. And so that's a new capability that we're getting better at. And working with partners like Bono to have that, and we need to keep learning.

Melinda Gates: I would say even in education, the U.S. education system, realizing -- I think we went into it a little bit naively at first, thinking if we could get enough of these small schools up and running, you'd get enough that the system would see how great they were that they would start to really replicate. And as we've learned more, we realized not only do you have to have of course great intermediaries to replicate those models, but you really have to work with the state and local government. You have got to work at the district level, and you've got to look at -- work at the state level if they're going to sustain those schools and grow more over time. And that's been a lesson for us. And we'll take lessons like that in every area that we work in.

Charlie Rose: Sixty percent of the Gates Foundation is directed to global health, as I understand it. And the other 40 is education, especially high school education and libraries. That pretty much would not change in terms of the percentage of what you spend in the future?

Bill Gates: That's right. The global health, which we also now include global development, so that's finance and agriculture and slums and sanitation, that is going to be 60-plus percent. And then education, which is very focused on the United States, you know, we said what's the biggest inequity in the world and what's the biggest issue for the country that we were lucky enough to grow up in, to maintain its incredible position and its incredible contributions. And so that will stay as our other big priority and be about a third of the resources. So both will be scaling up with this incredible gift.

Charlie Rose: Global health has gotten more attention, some would say. Is it simply because it's so much more visible, or have the successes there been more tangible than in education?

Melinda Gates: Well, I think you have to realize that global health is a whole mix of problems. I mean, we're talking about malaria and tuberculosis and HIV and rotavirus. So when we talk about it, it's hard to talk about it as all one thing. And I think Bill and I are both equally passionate about how do you lift up these people from poverty, about all the issues related to them. We equally -- we talk a lot about U.S. education, but I don't think it's not -- there aren't quite as many things to go and discuss as there are in global health. But we're constantly pushing in all these different areas. So, and I think also, as Bill gets more time and we're in the schools more, you'll hear us more, even more talking about the U.S. education system. We are passionate about it. And you know, I think -- you know, we give a lot of scholarships. We've got 1,000 kids a year on scholarships through one of our programs. And those are fantastic stories when you go and talk to those kids.

Charlie Rose: Thank you for coming. It's great to have you here on this program to talk about this. And I hope you'll do this again now that I've gotten you here. Bill, it's great to see you. I think you and I have done more interviews than anybody else. And it's always a pleasure to have you on the program. This is a great day for you.

Warren Buffett: It's a great day.

Charlie Rose: It really is.

Warren Buffett: Yes.

Charlie Rose: And there is a sense of excitement about it, because it is about the future. It's about changing lives. And I'm deeply, deeply thankful that you came here, because it is such an incredible story of this period, and as you said, this period of your -- your late wife Suzy is part of what's happened here today.

Warren Buffett: Thank you.

Charlie Rose: Thank you all for joining me. Thank you for joining us. The Bill and Melinda Gates Foundation as of today is a much different foundation. With the same goals, but more, as Bill would say, in its arsenal, to make an impact on people's lives around the world. Every life that is equal. Thank you for joining us.

Warren Buffett, PT. 1 (2006)

7/10/2006

Charlie Rose: I get to use whatever paint I want, paint whatever I want. I love it. Warren Buffett, the man, coming up. Warren Buffett is the second richest man in the world, worth about \$44 billion. He's chairman of the Berkshire Hathaway Corporation. He made headlines around the world on Monday, June 26th, 2006, when he announced he was giving \$31 billion of his wealth to the Bill and Melinda Gates Foundation. Together, they have created a foundation which will have more than \$60 billion to give away. It was an act of extraordinary generosity, borne out of friendship, shared values and mutual admiration. I admit it, I am prejudiced about Warren Buffett. He is a friend. He and his family have given me access and time to talk about his life, his business, his values and his philosophy -- his philosophy about everything. We have talked many times since our first interview in 2004 at the annual meeting of Berkshire Hathaway. His is a life worth talking about, because of his candor about it and his remarkable intelligence. And yes, his stunning wealth. Warren Buffett owns 31 percent of Berkshire Hathaway, a company with a stock market value of \$140 billion. His share is worth \$44 billion. Berkshire Hathaway owns part of some of America's most famous brand names -- Coca-Cola, the Washington Post Company, American Express and Procter & Gamble. And all of Fruit of the Loom, See's Candy and the Nebraska Furniture Mart. He is the subject of many, many newspaper and magazine stories, and more than 20 books have been written about him. For a man so famous and so rich, Warren Buffett has led a remarkably modest lifestyle in his hometown of Omaha.

Warren Buffett: Omaha is home. Always been home, always will be home. A lot of friends are here, but I just -- I feel good here. I mean, my kids are going to the -- my grandchildren now are going to the same public high school that my kids went to, my wife went to, my dad went to. I mean, almost 100 years. And there's a lot of continuity here. It's a great life. You feel like you're part of a community. I live in a house I bought in 1958. You know, that's 46 years ago. I'm happy there, you know.

Charlie Rose: You like the house. And so if it ain't broke, don't fix it.

Warren Buffett: Now, this office I've been in for 42 years. And it's -- everything falls into place. I do two things. Call it asset allocation. In other words, we have somewhere between \$100 million and \$150 million a week coming into Berkshire. And that's after all the needs of the operating businesses are taken care of. Because I let -- you know, if they build plants or anything, that's up to them. But then the remainder comes into Omaha. My job is to allocate that among anything in the world that makes sense to me. I can put it in marketable securities, I can put in bonds or equities, I can put it in -- I can put it in whole businesses. I can sit temporarily with it in cash. But that's my job. I mean, that is my sole responsibility. We don't do that by committee. We don't do it by advisers. That's my job. The second job I have -- and this is easier if you kind of get the ball rolling -- and that's to have talented, high-grade managers running our businesses who are happy running them. So when I buy a business, I'm usually buying the manager with it, because I don't know how to run the business. So I -- when somebody comes along and says they want to sell their business, I have got to look them in the eye and I have to decide whether they love the money or they love the business. It's OK to love the money some, but they have to love the business. They have to have a passion for it. Why am I running down here every day and can hardly wait to get to work? If it isn't for the money, it's because I get to do my job the way I like to do it. I get to paint on my own canvas. I feel like I'm Michelangelo down here and I'm doing the Sistine Chapel. Now, nobody else may think so, but they don't say, use a little red paint instead of blue paint or something like that. I get to use whatever paint I want, paint whatever I want. I love it. The second thing is they want applause. I want applause. I mean, I like it when people say that's a good job. And our managers are just

[More Compilations](#)

the same way. They have got a lot of money, most of them, and they want to be treated fairly. So you don't want -- they don't want to be taken advantage of. They want to paint their own painting. They love that. And they get it at Berkshire like no other place, and they want applause. And when they get applause from me, they're getting applause from a knowledgeable observer. I mean, it is not uninformed applause. So that keeps them. And you know, we've had remarkable success in keeping managers over the years.

Charlie Rose: Let me just talk for a moment about your skills.

Warren Buffett: We can do that in a moment.

Charlie Rose: You think one moment is enough?

Warren Buffett: Well, I'll stretch it out for you.

Charlie Rose: Let's assume we talk about energy and intelligence and integrity. Let's give those values and skills to you, all right? You have an extraordinary capacity to focus.

Warren Buffett: Absolutely, yes.

Charlie Rose: You read a lot.

Warren Buffett: Yes.

Charlie Rose: And you focus.

Warren Buffett: Yes. A lot of people I know that have done well in their own areas, focus. In fact, just about the first time I met Bill, we were at a place with 15 people eating dinner. And his dad asked -- went around the table and asked everybody what they thought the most important ingredient they brought to their game was. And I answered focus. And I saw Bill nodding his head across the table.

Charlie Rose: So you knew right there --

Warren Buffett: Yeah --

Charlie Rose: -- you were soulmates.

Warren Buffett: No, it's focus.

Charlie Rose: What do you mean by focus?

Warren Buffett: I mean just concentrating on what's important. I mean, you have to know your game. I was -- I was -- listen, I was lucky. I was born wired in a certain way, you know. I didn't have anything to do with it at all. I was born at the right time in the right place. Huge capital markets. America -- couldn't have been anything like it any place in the world. So here I am wired for it. And by focus I mean using that wiring, basically, and trying to get it so there's fewer flickers here and there and that sort of thing.

Charlie Rose (Voice Over): He was born on August 30th, 1930. His parents, Howard and Leila, lived on Barker Avenue in Omaha. (on camera): This is Barker Avenue.

Warren Buffett: Barker Avenue.

Charlie Rose: Tell me about this photograph.

Warren Buffett: Well, that's my mom and dad at 4224 Barker. And that's where I spent the first five or six years of my life. My dad, until 1931, was working for a bank, and he was selling securities. And then the

bank went broke in August of 1931. In fact, just about on my dad's birthday. At that time, my dad was paying, as I remember, \$55 a month on this house. He had no job. He had two little kids. I was one year of age at that time. And my grandfather had a grocery store. So there was at least a little food around. But it was a tough time. It was a tough time.

Charlie Rose: It was the beginning of the Depression.

Warren Buffett: It was the beginning of the Depression. Yes.

Charlie Rose: This one is?

Warren Buffett: That would be my sister Doris and me together.

Charlie Rose: And this one? This has to be --

Warren Buffett: I was big on costumes when I was a kid. My dad would go to New York, and when he came back he would usually --

Charlie Rose: Bring a costume.

Warren Buffett: -- bring you a costume. So I'd be a fireman or a cop or whatever.

Charlie Rose: Or a cowboy.

Warren Buffett: Or a cowboy, yes, right.

Charlie Rose: Did you have an entrepreneur spirit? Were you the kind of kid that wanted a paper route and wanted to sell lemonade and wanted to do all those things?

Warren Buffett: Yes, I did. I enjoyed it. And many years ago, I read about a study -- and I don't know whether the study is any good or not -- but somebody was trying to correlate business success with various factors, whether it was your grades in business school or, you know, what your parents did or anything. And it said it correlated best with the age at which you first got into your own business.

Charlie Rose: And when did you first get into your own business?

Warren Buffett: Well, I'm not sure exactly. But it was probably when I was maybe 6 or something like that.

Charlie Rose: Doing what? Do you remember?

Warren Buffett: Well, I would buy six packs of Coke from my grandfather's grocery store for a quarter and sell them for a nickel each.

Charlie Rose: That's a 5-cent profit right there.

Warren Buffett: Absolutely. Absolutely. And I had the whole Coca-Cola Company behind me pushing it.

Charlie Rose (Voice Over): Howard Buffett, his father, was elected to Congress in 1943, and the Buffett family moved to Washington. (on camera): He was your hero.

Warren Buffett: Absolutely.

Charlie Rose: Because? Yes.

Warren Buffett: You know, just everything about him. I mean, growing up with him. We were pals. You know, never saw him doing anything in his whole life that you couldn't put on the front page of a paper.

Charlie Rose: Why did he get into politics?

Warren Buffett: Well, he was a man of political ideas. But I don't think he ever had any ambition to get into politics. He was introverted. He basically didn't like to give speeches or anything of the sort. But he had strong ideas about political systems and about the individual and --

Charlie Rose: And about service?

Warren Buffett: Yes. And he had a strong political philosophy and a philosophy of life. And it was religious based to a significant degree. And he -- he was -- he thought the government should play a very minor role in people's lives, to almost an extreme degree. He may have gotten a little more extreme as he went over the years. I didn't agree with him totally on political philosophy even as I was growing up, and then I grew further from that. But it didn't change my feelings about him.

Charlie Rose: What do you see in yourself that most reminds you of your father?

Warren Buffett: Well, certainly, listen, if I could be three quarters of the man he was, I'd be very pleased with myself.

Charlie Rose: Why do you say that?

Warren Buffett: I just think he was the best human being I've known.

Charlie Rose: The best human being you've known?

Warren Buffett: Yes.

Charlie Rose (Voice Over): When he came back to Omaha, he met Suzy Thompson. (on camera): The Buffett family knew the Thompson family.

Suzy Buffett: Oh, my, yes. They were like this. The parents, the parents. The children didn't know each other, because Warren and his sisters lived in Washington from the time he was 13.

Charlie Rose: His father was a congressman.

Suzy Buffett: Right.

Charlie Rose: So when you first met him --

Suzy Buffett: I first met him, I was going to be his youngest sister's roommate at Northwestern. So I walked into their house, and he was sitting in this chair in the living room. And he made some sarcastic quip. I hadn't even met him. So I made one back. I thought, who is this jerk? And that's how we met, yes.

Charlie Rose: Here is the story. He chased you and you were dating other people.

Suzy Buffett: Um-hum.

Charlie Rose: He would come over to the house.

Suzy Buffett: Right. He -- my dad --

Charlie Rose: And sit with your father.

Suzy Buffett: Yeah, and --

Charlie Rose: And you'd gone off on a date.

Suzy Buffett: Right. My dad fell in love with him. Listen, Warren is smarter than you even know. My dad had a mandolin up in the attic. Warren said, Doc, get out your mandolin and I'll play with you with my ukelele. So they played together. And my father fell in love with Warren. And he kept saying to me, you don't understand this boy. He has a heart of gold. No pun intended. And that's what went on for quite a while. You know, I mean, but doesn't Warren always get what he wants?

Charlie Rose (Voice Over): Suzy and Warren Buffett were married, and they soon moved to New York to study and work with Ben Graham, a professor at Columbia University. Next to his father, Ben Graham remains an intellectual influence and a hero.

Warren Buffett: There are half a dozen that had a tremendous influence. And certainly Ben Graham influenced me enormously in terms of giving me the investment framework to work -- to go forward. I wouldn't be remotely where I am without Ben Graham.

Charlie Rose: Graham gave you the principle.

Warren Buffett: He gave me the foundation.

Charlie Rose: And you read the book first.

Warren Buffett: I read the book.

Charlie Rose: And said, I want to meet this guy?

Warren Buffett: Well, I was where I was. I wanted -- and I didn't understand he was teaching. Charlie, when I read the book and when I finished Nebraska, I was leafing through a catalogue of Columbia and his name popped out at me. And that's when I wrote and said, will you take me? But I had no notion about that.

Charlie Rose: Why were you willing to leave Omaha and go to New York? Was it that this guy knows something?

Warren Buffett: Oh, yes. I wanted to -- you know, if I was going to be a disciple, I wanted to see the messiah.

Charlie Rose: And you sort of viewed it that way.

Warren Buffett: Yes, I did.

Charlie Rose: Investing.

Warren Buffett: Sure.

Charlie Rose: When you read the book, you said to yourself --.

Warren Buffett: I said, this makes sense.

Charlie Rose: Makes sense.

Warren Buffett: It makes sense. Nothing up to then had really made sense.

Charlie Rose: And the principles are still the same.

Warren Buffett: The principles are absolutely the same.

Charlie Rose: Having changed what, though, as you changed circumstances?

Warren Buffett: Well, you just see more ways to apply them. I mean, the applications come up in different forms. But the principles remain the same.

Charlie Rose: Help me understand the operative idea about Ben Graham, of value investing.

Warren Buffett: Well, Ben just says, look at a stock not as some thing that wiggles around or is quoted in the paper every day or is up there on a ticker. Look at it as a piece of a business. Figure out what the business is worth. If you can't figure out what the business is worth, you have got no business buying the stock. And I had never thought of it that way. And so I started looking at businesses instead of stock charts and volume and all that kind of thing. And it was amazing, what kind of an edge that gave me. And then, secondly, he said the stock market is there to serve you, not to instruct you. So you don't look at stock prices as telling you whether you're right or wrong. You're there to take advantage of stock prices when they get out of line with reality. And then thirdly, he said always have a margin of safety. Don't try and drive a 9,800-pound truck across a bridge that says limit 10,000 pounds. Leave yourself room for error, because you don't know everything. So you always leave that margin of safety.

Charlie Rose (Voice Over): Buffett works in this office building with a staff of 16 and a collection of memories. (on camera): This is Gillette Safety Razor company.

Warren Buffett: Right. This goes back to the patent for the razor, going back I guess, well, this is 70 years ago roughly on that particular razor.

Charlie Rose: And how did Gillette come about? Or why did you decide to get involved in Gillette?

Warren Buffett: Well, Gillette, you know, here's a company that after 100 years of being in the razor and blade business has 70 percent or so of the value of razors and blades throughout the world. Now, when you have that kind of permanent advantage, obviously, with the consumer, it's not going to go away in a few years. It's not going to go away in decades. This is a company that really has something.

Charlie Rose: Meets the Buffett test.

Warren Buffett: It meets the test. It meets it. Durable competitive advantage. Durable competitive advantage.

Charlie Rose: And all night as you go to -- while you're sleeping, you know --

Warren Buffett: When I sleep at night, I know that hair is growing on the faces of billions of men around the world, and that hair is growing on twice as many legs of women around the world. But I don't think too much about the women's legs. I wouldn't get to sleep.

Charlie Rose: Here is the Omaha Royals.

Warren Buffett: The Omaha Royals, yes. Maybe 10 or so years ago, maybe a little more even, the owner of the Omaha Royals was going to sell, and probably move the team out of town. So at the time, it was the Union Pacific Railroad and Walter Scott and I bought the team, primarily to keep it in Omaha.

Charlie Rose: And it's still in Omaha?

Warren Buffett: It is still in Omaha.

Charlie Rose: And you suit up ever?

Warren Buffett: Oh, yeah. No, they count on me.

Charlie Rose: I've seen pictures of you in a uniform.

Warren Buffett: I've started several games, but they seem to pull me after one pitch.

Charlie Rose: Before the first pitch.

Warren Buffett: Yes, right.

Charlie Rose: We have a change in the starting lineup. Buffett will not be pitching today.

Warren Buffett: Nobody's got (inaudible). That was our first purchase. You can barely read it, because the ink has gotten faded.

Charlie Rose: By the partnership?

Warren Buffett: The first purchase of Berkshire stock by the partnership in 1962. And this is the trading record of a firm called at that time Tweedy, Brown and Riley (ph). And they were the brokers I used. A wonderful fellow named Howard Brown (ph) bought all my Berkshire for me at this small firm called Tweedy Brown (ph). And then many years later, they pulled off the trading card related to that first purchase and sent it to me.

Charlie Rose: This is what? Tom Osborne has signed this.

Warren Buffett: Yes. And Frank Solich too. And that's the record of Nebraska during the Devaney-Osborne-Solich --

Charlie Rose: 1962 to 2003.

Warren Buffett: It was quite a record.

Charlie Rose: They won a lot of football games.

Warren Buffett: They won a lot of football games.

Charlie Rose: That's a passion, the University of Nebraska.

Warren Buffett: I mean, you're not allowed to reside in Nebraska unless you're a little bit of a fanatic on the subject.

Charlie Rose: When you take Gates to a game in which they're playing against Washington?

Warren Buffett: He doesn't really respond very well. But in Nebraska, I mean, when there's a divorce in Nebraska, they don't argue about the kids. They argue about the football games.

Charlie Rose: Who gets the tickets. Here we have the New York Stock Exchange. And this is, let it be known that Berkshire Hathaway, Inc., Omaha, Nebraska listed on the New York Stock Exchange.

Warren Buffett: We had problem doing that because of the price of our stock and everything. It took a little special action by the Exchange, which I appreciated.

Charlie Rose: Explain that to me.

Warren Buffett: Well, it's just that they had some rowant (ph) requirements and all that, that were designed for lower-priced stocks. And we didn't have the number of 100-share owners that were required at the time. So they redefined it a little bit to allow Berkshire to be --

Charlie Rose: There are always people who want to know why you've never split the stock.

Warren Buffett: Well, we don't split the stock because we're not -- we don't want to encourage the kind of buyer who is excited by stock splits. And this way, it keeps it more of a business atmosphere and less of a day-to-day stock atmosphere around it.

Charlie Rose: And is there any sense that the people that you want to invest in Berkshire Hathaway, you want them to come in for a long time --

Warren Buffett: Definitely.

Charlie Rose: -- and you want them to take seriously the decision to buy Berkshire Hathaway.

Warren Buffett: We want them to join in the business with us, with the intention of holding it forever. Now, all kinds of reasons why they might not, but that's the goal.

Charlie Rose: Do you check the price of the stock every day?

Warren Buffett: I probably know about it sometime during the day, maybe at the close, but I'm not checking --

Charlie Rose: And if there's some movement, you're not interested why there is movement, who might be selling or who might be buying?

Warren Buffett: Doesn't make any difference.

Charlie Rose: Doesn't make any difference?

Warren Buffett: No.

Charlie Rose: So on this wall, here's Tom Murphy -- and you were in a soap opera.

Warren Buffett: I was in about four soap operas. That's because every time I got invited, they hadn't seen the earlier ones. And Susan Lucci was terrific. I mean, she -- she -- and Tom Murphy and I were there. We couldn't remember our lines or anything. She carried us through.

Charlie Rose: Now, you played yourself?

Warren Buffett: Yeah.

Charlie Rose: Buffett and Murphy show up on the set of All My Children.

Unidentified Male: May I introduce my friend, Warren Buffett.

Unidentified Female: Oh, my, I am so thrilled to meet you. I have been such a fan of yours for such a long time. But I must tell you that your photographs do not do you justice at all, Mr. Buffett.

Warren Buffett: Please call me Warren.

Unidentified Female: Well, thank you. If you'll call me Erica.

Charlie Rose: Susan Lucci is the long-time star of that show.

Warren Buffett: Right.

Charlie Rose: Now, they paid you for this.

Warren Buffett: They paid me for this. I tried to negotiate for more, but I didn't have much luck. The mural says a wardrobe allowance, which they gave me for \$10. And that was in 1991. I haven't spent it yet. Some day, something will come along.

Charlie Rose: This is funny. This is the story about Gorbachev when he was ousted. "Hard-liners declare emergency, tanks rolled into Moscow streets." And the man that they were assuming to be, Gennady Yanayev, is not in fact -- it is Warren Buffayev (ph).

Warren Buffett: He may be my long-lost twin. I don't know. But this was the day after I took over at Salomon, and I thought some of the -- A, they got my picture mixed up, then there's "hard-liners declare emergency," (inaudible) --

Charlie Rose: It would have fit for Salomon?

Warren Buffett: It kind of fit, yes.

Charlie Rose: This is you batting against Bob Gibson?

Warren Buffett: Bob Gibson, right.

Charlie Rose: You take your life into your own hands.

Warren Buffett: I only play against the best.

Charlie Rose: What was it, (inaudible) that's ever been --

Warren Buffett: Yes, we're friends, but I wasn't sure how far that would carry me.

Charlie Rose: So Brokaw sends you a note saying, copy, but Gibson --

Warren Buffett: May object or something.

Charlie Rose: May object.

Warren Buffett: Baseball -- I've always liked baseball. I mean, I don't follow it the way I used to, when I was a kid, but baseball is, you know, I love sports generally.

Charlie Rose: Everywhere I look, there's you in a uniform. There's a hockey thing over there. Here is a man that you referred to because of his approach to hitting represents what to you as a metaphor?

Warren Buffett: Well, Ted Williams was all about discipline in hitting. He said the most important thing was waiting for the right pitch. And he illustrated -- in his book, "The Science of Hitting," he illustrated that. And you know, he looked at hitting as something that he thought about morning, noon and night. You know, and always was looking for how to do it better. But discipline, he said swinging -- waiting for the right pitch is the most important thing in batting.

Charlie Rose: And you think about morning, noon and night Berkshire Hathaway in what way?

Warren Buffett: Well, we keep waiting for the right pitch. And we're not going to swing at some pitch that some other fellow might like. I mean, if our favorite pitch is two inches above the naval, some other guy likes it, you know, around the letters or a little lower or something, that's fine. But in business, unlike

baseball, there are no called strikes. So you can sit there and the pitcher can throw you IBM at 62 or General Motors at 28 and all kinds of things, and nobody is going to call a strike. If you swing at one of those pitches when it comes across, Berkshire Hathaway at 748, you know, and you miss, it's a strike, but it's a terrific game that way because you can sit there and wait and wait and wait for the right pitch. And there are not many things in life where you get that option.

Charlie Rose: And that's exactly what you're doing now.

Warren Buffett: That's what I do now. And I did it before.

Charlie Rose: In anticipation of this annual meeting, you have to say to the stockholders, I've been waiting for the right pitch and I haven't seen it.

Warren Buffett: That's right. That's right. And some pitch somebody else can hit out of the park, you know, but I don't think I can. You know, that's my problem, but I'm not going to -- I am not going to think I can hit a pitch that I can't.

Charlie Rose: Does it kill you to know that we've got \$40 billion there, not earning huge interest rates in today's market?

Warren Buffett: Yeah, well, I don't like it. But I like it better than swinging and missing. And the problem for most managers is that they've got all these people up in the stands yelling "swing, you bum." You know, but we've got a group of shareholders who not very often yell out "swing, you bum."

Charlie Rose: In fact, they're yelling out swing when you're ready. And that's the confidence that you developed.

Warren Buffett: That's right.

Charlie Rose: Why do they come to this annual meeting?

Warren Buffett: I think they have fun. I mean, it's, you know, they see people they like. I think they -- they learn more about Berkshire. It's kind of a reunion for many of them. There's all kinds of little clubs develop and friendships develop out of it.

Charlie Rose: A little shopping on the side.

Warren Buffett: Yes, shopping on the side.

Charlie Rose: Get to see a free movie.

Warren Buffett: In the end -- yes, that's about it, though. We don't give them goodies or anything like that. I mean, they come because they want to come.

Charlie Rose: And here is Babe Ruth.

Warren Buffett: That's the Hall of Fame after the second year minus Ty Cobb, who was late.

Charlie Rose: Now, this is up here simply because you love baseball?

Warren Buffett: I just think those are -- you know, those are the champs. They were the first people put in the Hall of Fame.

Charlie Rose: And Ty Cobb --

Warren Buffett: He was late for the picture. And whoever took it wouldn't wait.

Charlie Rose: But he actually knew your great friend, Carol Loomis.

Warren Buffett: He dated her.

Charlie Rose: He dated her?

Warren Buffett: He dated her, right. Now, bear in mind --

Charlie Rose: A little bit of her history we didn't know.

Warren Buffett: To be honest about it, I mean, he was 40 or some years older than she was at the time. But his nephew called her and said my uncle Ty has been watching you on television -- she was on a quiz show -- and he would very much like to take you out. She went a couple of times.

Charlie Rose: She said, it's worth getting to know Ty Cobb.

Warren Buffett: Right, right.

Charlie Rose: So here's when Tiger Woods -- to Warren, he says, "I thoroughly enjoyed our day together and look forward to doing it again. Signed, your friend Tiger." Was he caddying for you?

Warren Buffett: No, no, I was caddying for him. And if I had my back here, on the back of it, it says "Woods." I mean, that was --

Charlie Rose: Oh, I see.

Warren Buffett: Then on the 18th hole, he said, now, Warren, he said, I understand you play this game. And I said not the game you're talking about, Tiger. He said we're going to play the 18th hole and we're going to play it for serious money. And I said, Tiger, all money is serious money. He said, no, we're going to play for \$5. I said, that's serious money. And then he got down on his knees. He played me on his knees.

Charlie Rose: So every stroke he hit was on his knees.

Warren Buffett: I mean, he was all the way down on his knees.

Charlie Rose: And how did he do?

Warren Buffett: Well, he hit his drive about 260.

Charlie Rose: On his knees?

Warren Buffett: On his knees. It was unbelievable. Straight out.

Charlie Rose: He's out like this when he --

Warren Buffett: Yeah, he didn't even adjust himself after he was down. So I went over and I handed him \$5. And then I said, Tiger, I think you're forgetting something. He said, what's that? I said, the caddy gets 10 percent of your winnings. I'm still waiting for the 50 cents.

Charlie Rose: One day he'll caddy for you.

Warren Buffett: He's a terrific guy. He is one terrific guy. I can tell you that. It was part of a charity deal. And I mean, he went all out, delivered value to the people that bought the right to play with him.

Charlie Rose: And as Jack Nicklaus says, he plays a game I'm not familiar with.

Warren Buffett: I remember when he said that.

Charlie Rose (Voice Over): If you go to Omaha, Nebraska to see Warren Buffett, one of the things you might end up doing is going to Gorat's restaurant, one of his favorites. We did that and we talked with him about a typical day. (on camera): Walk through a day for me.

Warren Buffett: The day is -- you wouldn't believe the day. I mean, I come down and I --.

Charlie Rose: At what time?

Warren Buffett: Well, I do some reading -- I usually read a lot of the papers at home. I get up around 6:45.

Charlie Rose: Paper or online?

Warren Buffett: Mostly regular paper, but I also click on some things.

Charlie Rose: Yes. You have a favorite list, too?

Warren Buffett: Yes, right. I've even got THE CHARLIE ROSE SHOW up there. I want to see who's on your -- I really do. So I get up about 6:45 usually. But I may get to the office at 9:00. And I may get there at 8:00. But I have no schedule to speak of. I mean, here's my date book, you know, just take a look.

Charlie Rose: Can I do this? This is not jam packed with appointments.

Warren Buffett: 8:00, 9:00. I just don't do it. So -- I don't want to live that way.

Charlie Rose: You decided that a long time ago.

Warren Buffett: A long, long, long time. I decided that when I was delivering papers, you know, when I was a kid. I knew what I enjoyed and what I didn't enjoy. I like delivering papers. I'd still would like to deliver up. But I don't want to be head of IBM or General Motors.

Charlie Rose: Why not? Because --

Warren Buffett: Your life is too taken up by things that you don't really have choices about.

Charlie Rose: Meetings and agendas and --

Warren Buffett: Yes, I just don't want to do it.

Charlie Rose: Take me -- 9:45. You get in at whatever.

Warren Buffett: I do more reading. I read five newspapers a day. I read all kinds of annual reports and magazines and 10Ks and 10Qs. And so I would say I spend 75 percent of the day at least, maybe 85 percent reading. And I spend the rest on the phone. And I make -- I buy or sell stocks or bonds or foreign currencies. I mean, I -- but that doesn't take much time. Because we're not doing that on a broad scale. And then I go home and I play bridge or I read some more.

Charlie Rose: Go home at 5:00 or 6:00?

Warren Buffett: Yeah, although that can be -- there is no -- I don't like to have structure.

Charlie Rose: You have no schedule.

Warren Buffett: I don't like to be structured.

Charlie Rose: So if you want to go home at 3:00, you go home at 3:00. If you want to go home at 7:00, you go home at 7:00.

Warren Buffett: Exactly.

Charlie Rose: And read more.

Warren Buffett: Yes, usually, or play bridge now more.

Charlie Rose: Online.

Warren Buffett: Online. I would pay -- and I don't mind saying this to the people that own it because they don't know how to get it from me. I would pay \$5 million a year for the ability to play online bridge 12 hours a week. It's worth it to me. You know, if I compare it to the cost of the second home, which wouldn't mean a thing to me to speak of, or the cost of a boat or whatever it might be. I mean --

Charlie Rose: (inaudible) is to be able to play --

Warren Buffett: If you deliver 12 hours of joy, playing with my sister in Carmel (ph) or whoever it may be, you know, doing it in a few seconds, clicking on, great, you know, interface on it, I'd pay it. But they can't -- so I'm paying about \$95 a year.

Charlie Rose: (inaudible) and bridge and friends. Those two things.

Warren Buffett: And the bridge and the friends intersect, of course. I mean, this Saturday I'll play with Bill at 10:00 my time, 8:00 his time. We'll play for a couple of hours.

Charlie Rose: And you always win?

Warren Buffett: No. I'd tell you so, but you'd check with everybody --

Charlie Rose: That's -- I would, too.

Warren Buffett: Yeah.

Charlie Rose: The notion of investing for you. What are you looking at when you read? You are looking for an interesting company? You are looking for --

Warren Buffett: I'm looking for business I can understand. I'm like a basketball coach. If I walk down the street, the first thing I look for is seven footers. And now, once I find a seven footer, I still have got to figure out whether he's coordinated and whether I can keep him in school and all those things. But if some guy comes up and he says, you know, he's 5'6 and he says, you know, wait until you see me handle the ball and all that, I'm not looking for those kinds.

Charlie Rose: You want to look up at your players.

Warren Buffett: Yes. When I first started, I used to find a lot of seven footers. Harder to find seven footers now, because my universe isn't as big. But I look for things I can understand. I think I know what the economics of the business will look like five or 10 or 20 years from now. And it doesn't mean, you know, I understand what a computer does, but I don't know who is going to be making lots of money off the computers 10 years from now any more than I knew who was going to be making a lot of money off of television sets back in 1960. Turns out nobody was.

Charlie Rose: But you've always, always taken the position that really you don't want to make speeches except to business students and to kids.

Warren Buffett: Just to students, yes.

Charlie Rose: What's the idea?

Warren Buffett: The idea is that they listen. And you may change some lives. I mean, I -- the things I heard when I was 20 from somebody I wanted to listen to changed my behaviors in ways. And the people I listen to at age 74, I want to be entertained, all that, you know.

Charlie Rose: But it's not going to change your life.

Warren Buffett: That's not going to change anything. So if I talk to a bunch of 50- or 60-year-olds, basically they want to be entertained and they want predictions. But if I talk to 20-year-olds, A, they ask - or 25-year-olds, they ask me the questions, what's on their mind. And they really get to what's on their mind, and they listen. And you can see it in their faces. And then they write me afterwards, and it changes some lives. The biggest thing we talk about, and I know it resonates with them, because a lot of them are thinking they ought to go into this line or that line, because it will look good on their resume or they'll get a little more experience. I tell them, if you wait until you're 80 to do something you like, I say that's like saving up sex for your old age. You won't have a passion for what you do. Why go through life waiting for the big moment when you're 82?

Charlie Rose: Preparing for something else.

Warren Buffett: Yes, right. It doesn't make any sense. It doesn't make any sense. I tell them, you know, basically unless Shirley MacLaine is right, you only live once. And we go from there.

Charlie Rose: No evidence yet that she's right.

Warren Buffett: I hope she's right.

Charlie Rose: I do too. Talking to students about life and business is one of Warren's passions. He does it more and more these days. From all over the world, they make a pilgrimage to Omaha. One such appearance that was filmed for public television was at the University of Nebraska in Lincoln, where he appeared with his friend Bill Gates.

Unidentified Female: Hi. My name is Nicole Brockhaus (ph). I am a senior business administration major here at the university. And I was just wondering, what is the best piece of advice you've ever been given and how has it impacted your personal or professional lives?

Warren Buffett: I think that, you know, I got an awful lot of good advice from my dad. And he didn't lay it on me. I mean, he just, you know, you picked it up from him. But there was never any of this, you know, do this, do that type of thing at all. But I think he really taught me that it's more important in terms of what's on your inner scorecard than your outer scorecard. Some people get into a position where they're thinking all of the time of what the world is going to think of this or that instead of what they themselves think about it. If your inner scorecard, if you're comfortable with that, I think you're going to have a pretty happy life. And I think the people that strive too much for the outer scorecard sometimes find that it's a little hollow when they get all through.

Unidentified Female: Hello. My name is Kim Martin (ph). I'm a senior finance major here at the university. My question is, how do you instill ethical leadership throughout your organization? And to

begin with, how do you know that the management one level below you is making decisions that would parallel your own?

Warren Buffett: We have all the money we need. You know, we'd like to have more, but we can afford to lose money. But we can't afford to lose reputation, not a shred of reputation. And therefore I ask the managers, I ask them to judge every action they take not just by legal standards, although obviously that's the first test, but also by the test -- what I call the newspaper test. How would they feel about any given action if they knew it was to be written up the next day in their local paper to be read by their family, by their friends, by their neighbors, written by a smart but kind of unfriendly reporter. And if it passes that test, it's OK. And I tell them if anything is close to the lines, it's out. And they can always call me if they wanted to check something. But if they call me, there's something wrong with it probably anyway. And that's about it.

Bill Gates: In Microsoft's case, our top management team, the majority of them joined us right after whatever degree they got, if any.

Warren Buffett: I should mention that I am the only college grad up here.

Charlie Rose: You've made a point to see almost any group of students who will come to Omaha. What is it about that? What do you get out of it and what do you think they get out of it?

Warren Buffett: Well, I like teaching. I mean, I taught my first class when I was 21. And I just enjoy it. I enjoy the interaction. I mean, it's fun to sit there and have them throw questions at me. And so I've always enjoyed doing it. And I do as much of it as I can.

Charlie Rose: Where is their curiosity?

Warren Buffett: Where is it?

Charlie Rose: Yeah. What is it -- what questions do they ask?

Warren Buffett: They ask a lot of -- they're business students, a lot of them, and so they're interested in markets and business and all that. But they're also interested in their own lives. And that's when it gets the most interesting. They ask me personal, a lot of personal questions, and I answer them. And it's interesting to know what's on their mind, because they're groping. I mean, they're looking for the road they're going to take in life. And a big part of that is the business and making some money and all of that, but that isn't the only part of the road. And we have good discussions about that. And I enjoy it.

Charlie Rose: And about values and about the notion of friendship and the notion of --

Warren Buffett: And how you're going to feel about yourself when you're 70 years old, and what -- looking back, what you'll feel good about and how you get there. I mean, I want them to reverse engineer their life, you know, basically.

Charlie Rose: To look at what you would like for it to be at the end.

Warren Buffett: Sure. And work backwards.

Charlie Rose: And then ask yourself, how do I work. Buffett tells students about the inherent advantages of where you were born.

Warren Buffett: Let's imagine that it's 24 hours before you're born. And a genie comes and he says, Charlie, you really look like you've got good judgment. I'm going to give you an enormously important

task. I'm going to let you design the world into which you're going to be born in 24 hours. And you say to the genie, I appreciate the responsibility. You picked the right guy. But what's the catch? I mean, there has got to be. The genie says, there's just one catch. Before you arrive into that world, after you've designed the rules, you're going to go over that big barrel over there, and there's 6 billion tickets in it, and you're going to pull a ticket out. That ticket may say male, female, may say rich, poor. What kind of a world do you want to have not knowing what ticket you are going to get? I call that participating in the ovarian lottery. I got a ticket that said United States. You did too, you know. I got a ticket that said smart about certain things. All of that helped me. But I say, you should design a political system that will deliver lots of goods and services to people, but then will search for fairness in how those are distributed. So I come into this and abundance is just showered on me, because I have a talent. Gates says if I had been born at some other time or some other place a long time ago, I would have been some animal's lunch, because I don't run very fast and I can't climb trees. So I would be talking about allocate capital and that (inaudible) would be coming right at me.

Charlie Rose: And he offers a profound definition of success.

Warren Buffett: Let me tell you a story. It gets there. I have a friend here in Omaha. She's my wife's best friend. Sixty-odd years ago, she was in Auschwitz. She's a Polish Jew. Her whole whole family did not come out. If you talk to her today and you ask her about friendship, she would say she would define it as who would hide me. She says, that's the bottom line. I would say that if you get to be my age, or much younger for that matter and you have a lot of people who will hide you, the people who you want to have hide you would do so, you're going to feel very good about your life. It's the real test. I mean, it's a referendum on how you've lived your life. And you can't fake the ballot box on it. I mean, it's all important. And you certainly want to feel that way with your kids, but it's wonderful when you feel that way with your business associates and those who work around you.

Charlie Rose: Friends, real friends are important to Warren Buffett. And here are three of the closest -- Tom Murphy, former CEO of ABC Capital Cities; Charlie Munger, vice chairman of Berkshire Hathaway; and Don Keough, chairman of Allen & Company. TOM MURPHY, FORMER CEO, CAPITAL CITIES/

Abc: Warren would never take advantage of anybody. He's never looking to make a bad deal for the other guy. And he's completely honest and fair with everybody.

Charles Munger: It's the nature of life, that as the old Germans say, you're too soon old and too late smart. Anybody that helps you get smarter a little earlier enormously improves your life. And all we do is prove these simple old adages like that German saying. Warren got me smarter in some ways a little earlier. And that helps me.

Charlie Rose: How close did you live to the Buffetts?

Donald Keough: Well, I lived across the street.

Charlie Rose: Across the street?

Donald Keough: Across the street. We -- I bought a house there around 1959. A three-story house, brick house, tiled roof. Paid \$27,500 for it, and there was a young fellow living across the street in another house, big house. He paid \$30,000, I think, for his. His name was Warren Buffett. Nobody knew who he was. He was a nice guy. He had -- I think he and Suzy had three kids. We had four, working on five. And you know, I got to know him. He wasn't easy to know, because you didn't see much of him, but my kids did. Of course, the real story is that he came across the street one day and he said, Don, I love your kids. I

said, I know. And he said, you know, I was thinking about college, you know, getting kids through college isn't easy. And I said, Warren, I'm working on grade school right now. I'll get around to college a little later. He said, I've started a little fund, people putting a little money into it. And if you gave me, say, \$10,000, I think I could build that up into something. Well, Charlie, I didn't give it to him. For two reasons. One, I didn't have it. I could have borrowed it from my father. But I went in to Meckie (ph) and said, can you imagine giving \$10,000 to a guy who doesn't get up and go to work in the morning? It was one of my great decisions of my life.

Charlie Rose: If you had given him that \$10,000 --

Donald Keough: Don't ask.

Warren Buffett: Yeah, probably over \$400 million.

Charlie Rose: About \$400 million.

Warren Buffett: Yes. We're still friends, incidentally.

Charlie Rose (Voice Over): Suzy, Warren's beloved wife, unexpectedly died in 2004, one month after she sat down with me for her only television interview and talked about their unique relationship. (on camera): According to him, to me, he would not have made it without you. You gave him something.

Suzy Buffett: Well, I feel really good about that, Charlie, because whoever you are in this life, you don't want to think you've wasted a lot of your energy and love and time on something useless. Warren is phenomenal. And I felt that the best thing I could give him was unconditional love, and I have. And he says, you're like a little watering can, you know, and I'm the flower. And how could you not feel good about that?

Charlie Rose: He made you feel needed.

Suzy Buffett: Very much so.

Charlie Rose: And you knew he loved you.

Suzy Buffett: Oh, I don't know that anyone has ever been more loved. It fits me to be needed and to know that what I have to give is the right thing. And if you have two people -- we just had a lot of love and respect for each other. And that's never changed. PETER BUFFETT, COMPOSER/

Producer: Again, I can't help but relate it to art, because any great novelist, painter, musician is going to need the room to allow that to grow. And something is going to grow if it's in the right soil. And my mother gave him the soil. That's really what it is.

Charlie Rose: Did you get more mothering than fathering because he was so into reading and --

Susan Buffett: Yes, yes. I mean, my mother was there, and she was there and more present, in the sense that my dad was, you know, sitting in his office or room doing a lot of reading.

Charlie Rose: Why did you move away from Omaha?

Suzy Buffett: I'll tell you, I am a person who likes a private life. And I thought, you know, I would like to have a place where I could have a room of my own. It would be nice. Because, you see, physical proximity to Warren doesn't always mean that he's there with you. I mean, you can -- there hasn't been any change in anything because -- which he has -- it took him a while to figure it out, but he figured it out. I said, I'm not leaving you, because I'll be wherever you want me when you want me. But most of the

time, when you're in the same house he is or whatever, he's up reading. And that's why I learned to have my own life. We were two parallel lines, and -- but very connected when he was open to connecting.

Peter Buffett: You just got this sense that there were two people that were very much in love, but were sort of becoming disconnected in a certain way. Because my mom loved life. And my dad loved what he's always loved, you know, his work.

Charlie Rose: He loved his work.

Peter Buffett: Absolutely. And so I think what my mom was starting to see coming was this idea of, you know, I don't want to be Mrs. Warren Buffett in Omaha, because she doesn't -- she just can't think of herself that way. She's an independent, strong-willed, giving human being that needs to be connected to a lot more things than what Omaha I think would have to offer after her kids were gone. I mean, she really gave us and my dad everything.

Charlie Rose: Are you responsible for Astrid?

Suzy Buffett: Well, yes. I mean, well, I'll tell you. I call her Aya, that's a term of endearment.

Charlie Rose: You call her what?

Suzy Buffett: Aya.

Charlie Rose: Aya.

Suzy Buffett: It's a term of endearment. When I was singing at the French cafe in Omaha, I was maitre' d, the woman that met you at the door. And she is a very helping, giving person. And between sets, she would always bring me tea and we would sit and talk. And we became very good friends. Then when I moved to San Francisco -- I mean, it would have been all right for some other person, but Warren can't find the light switch, and it's probably my fault. But I don't take all the blame (ph) for that. So then I called Astrid, I said, Astrid, will you make Warren -- make him some soup, go over there and look after him, because he's not going to make it. I mean, he's different than a lot of guys. Because we see each other all the time and we do things. But he just can't -- no, he can't function.

Charlie Rose: She went over and stayed.

Suzy Buffett: Yes. And stayed. And that was -- she's done me a great favor, let me tell you.

Charlie Rose: She took care of your man for you.

Suzy Buffett: She did. And she takes great care of him. And he appreciates it and I appreciate it. She's a wonderful person.

Charlie Rose: And they go out to dinner and everything.

Suzy Buffett: Yes, they just do.

Charlie Rose: She's a companion.

Suzy Buffett: They do what they do.

Warren Buffett: This is real parmigiana.

Unidentified Female: This is the reason he comes. The hash browns.

Warren Buffett: The has browns, yes.

Susan Buffett: They were really good friends. I mean, I think it's true, they loved each other. I know Astrid loved my mother and my mother adored her. Yes.

Charlie Rose: So your mother's death was tough for her too.

Susan Buffett: Oh, it was very hard for her. Yes.

Charlie Rose: But even more important for her to be strong because --

Susan Buffett: Yes.

Charlie Rose: It's one of those things that is so strange, it works.

Susan Buffett: That's exactly right. I mean, I always think, you know, this is one of those things that unless you're in it, you may not get it. But it works, and it's great.

Peter Buffett: She knew that my dad would need somebody, certainly. And I don't know or I don't remember the exact details, but I do know that there was essentially a -- do you mind making him chicken soup? And one thing led to another, basically, which is phenomenal. I mean, it is extraordinary how that worked out I think for everybody.

Charlie Rose: He was devastated by Suzy's death.

Susan Buffett: Oh, that's an understatement, yes.

Charlie Rose: Couldn't even get out of bed.

Susan Buffett: Well, he did get out of bed. I was proud of him. I didn't know if he would be able to get out of bed for a few months, but he did.

Charlie Rose: I mean, he was just -- because it was so sudden.

Susan Buffett: It was a huge shock. I mean, my mother, you know, she got sick in October of 2004, went through this really awful operation and very difficult radiation and recovery and was doing really well. It was slow, but she was doing really well. And she had an MRI I think just a few days before she died. And she was very excited. She was doing great. And --

Charlie Rose: And didn't die from cancer. Died from a stroke.

Susan Buffett: No, she didn't die from the cancer.

Howard Buffett: You know, I think that for any of us, it was hard to imagine her ever being gone. I'm sure that's probably natural --

Charlie Rose: He said to me he thought he would go first.

Howard Buffett: I think we all thought that. I mean, I would have said the same thing if you'd have asked me that question. And I don't know why that is. But you know, she was the true matriarch of the family. And so I think we just -- for some reason, we felt that way. And for not any logical reason, but you know, that was just a -- I never asked Suzy or Peter how they felt, but I mean, that would have been my answer to the question, is that I just thought that she would have been around towards the end. And I think that, you know, he's still adjusting to it. I mean, it probably takes years to adjust.

Charlie Rose: Five years, he said I'll be the same. He told me five years from now, I'll feel the same way.

Howard Buffett: And that's probably true.

Charlie Rose: Can't talk about it, though.

Howard Buffett: Well, that doesn't surprise me. I mean, you know, she was something very special.

Charlie Rose: Has he changed?

Peter Buffett: I think he has a little bit. He's never too busy or uninterested, which is fantastic. And that has only increased. I think that's the biggest thing over time, and specifically since my mom's death.

Charlie Rose: That he's more available?

Peter Buffett: Well, just greater interest in being in touch. You know, my show was on the Mall in Washington when the Smithsonian opened their National Museum of the American Indian. And I called him up and I said, you know, normally I would call my mom and I'd tell her how excited I was, and then she would call you and tell you how excited I was. So I'm calling you and telling you, you know, because she's not here anymore.

Charlie Rose: He has said there's nothing more important in life than to have someone you love who you know loves you back.

Howard Buffett: Well, I mean he would know that with her. There's no question about it.

Charlie Rose: This is a remarkable woman.

Warren Buffett: Yes.

Charlie Rose: You know, and the pictures of her -- every picture I would see of Suzy, she's smiling.

Warren Buffett: It's going to be hard to talk about.

Charlie Rose: I know. But you've got to talk to me about it, because she talked about you.

Warren Buffett: Charlie, I'd like to talk about it, but I can't.

Suzy Buffett: There's no finer human being than who he is. So I overlooked the money.

Charlie Rose: Two years later, Warren Buffett decided to give \$31 billion to the Bill and Melinda Gates Foundation and \$6 more billion to family foundations. What surprised you about the reaction? And I'll tell you what surprises me.

Warren Buffett: Well, it just surprises me that there was so much reaction, to tell you the truth.

Charlie Rose: The whole thing.

Warren Buffett: Yeah.

Charlie Rose: But when you think about it, I mean, it has so much drama, that the second richest person wants to give his money to the first richest person.

Warren Buffett: I could see that angle. Yes.

Charlie Rose: Yes, that makes it --

Warren Buffett: If it was the 20th or something like that, it wouldn't have had the same impact. Yes.

Charlie Rose: And its' so far ahead of everybody else that it is just, you know, that makes it -- the other thing that surprises me --

Warren Buffett: We haven't heard from the sultan of Brunei, incidentally.

Charlie Rose: Yes, exactly. Where is he? The other thing is everybody asks about the kids as if somehow the kids are going to be pissed off. It was sort of a surprising thing to me that somehow -- and to know your kids and how much they love you and what a great family it is, it's like the thought never occurred, yet everybody wonders, what about the kids.

Warren Buffett: They think it's the best thing that ever happened. Two of the three kids have told me in the past -- I'd set up these small foundations seven or eight years ago for them, and they had a little -- they have told me they would rather have me give more money to the foundation than to give that same money to them. They're more -- they'd say they don't need money. And they consider themselves ungodly blessed, and they love working with the foundation. Literally two of the three have said, come up to me, you know, at a Christmas time when they thought I might have been adding to the foundation, they said, don't give money to me, give money to the foundation.

Charlie Rose: You also had a wonderful marriage.

Warren Buffett: Right.

Charlie Rose: Have the things that have happened since 2004, given you a sense to put all that in context?

Warren Buffett: It's always tough, Charlie.

Charlie Rose: But this in a sense, it seems to me, and I've said this on a previous conversation we had here at this table, is so in touch with the spirit.

Warren Buffett: Yeah, it's the right thing to do. And Suzy would have thought it was the right thing to do.

Charlie Rose: When you think about the future, is it just continuing to paint the picture?

Warren Buffett: Absolutely. It doesn't get any better than this. I mean, I don't know how long you can do it, but you're just plain lucky in life if you get to do something that you love doing with people that you love being around.

Warren Buffett, PT. 2 (2006)

7/11/2006

Charlie Rose: This is the Berkshire Hathaway annual meeting. 20,000 people come from all over the world to Omaha, Nebraska, for a weekend of fun, shopping and to see their hero in person.

Unidentified Male: Warren Buffett! (MUSIC)

Buffett: See my agent.

Charlie Rose: They even get to see a movie about him.

Warren Buffett: It all began with the key strategic alliance. A merger 100 years ago between Microsoft, Wal-Mart, and Starbucks. Microwallbucks (ph). However, an elite rebel force of investment bankers created me, a biogenic being who can travel back in time and stop the strategic alliance from ever taking place. I am the warrenator!

Charlie Rose: This is the annual meeting in April, 2004, and Warren Buffett is front and center. (on camera): What do you think they most want to hear this morning?

Warren Buffett: Well, that's the nice thing about taking unfiltered questions is you find out.

Charlie Rose: Yeah.

Warren Buffett: I mean, you know, the press is naturally on governance issues --

Charlie Rose: Right. Right.

Warren Buffett: -- but in the end, you know, we'll talk about what shareholders want to talk about.

Charlie Rose: Yeah. It is a kind of weather vane --

Warren Buffett: Yeah. It's - yeah.

Charlie Rose: -- of where they are in terms of --

Warren Buffett: Because, you know --

Charlie Rose: -- what their concerns are.

Warren Buffett: Yeah, we'll get 50 or 60 questions by the end of the 3:10 this afternoon, and --

Charlie Rose: Yeah.

Warren Buffett: -- interestingly enough, every question almost comes from somebody outside of Omaha. The Omaha people don't -- they seem to defer to the out of - and but we'll find out what's on their mind.

Charlie Rose: Near the end of April in 2005, we went inside to see what happens. Warren Buffett and his partner Charlie Munger sat on stage and answered questions for more than four hours.

Warren Buffett: We work together. We really don't have any choice, because he can hear and I can see. A few years ago, we have a dinner at Gorat's the day after the meeting and we were in having -- the whole family was there having dinner, the place was packed, and it started raining cats and dogs. And a waitress came to me, we were eating, the waitress said - said "I've got to tell you" she said, "It's raining like crazy outside and there's a long line and Michael Eisner is standing out there getting soaked." So I turned to

Suzy -- and Michael and Jane are friends of mine, good friends -- and I said to Suzy, why don't you go out there and help them out before they get drenched. And she looked at me and said, "I've waited in line at Disneyland."

Unidentified Female: My name is Molly Faner (ph). I'm 11 years old and from Long Island, New York. What is your view on PetroChina?

Warren Buffett: If you come up at the break, Charlie and I will have taken all the pieces out of here that we like best, and you will be - you will get the rest. Charlie, do you have anything to add to that?

Charlie Munger: She wants to know what you think about PetroChina.

Warren Buffett: We have real owners on our board and what they make for being board members is really inconsequential, as I get reminded occasionally. Compared to their investment. And they're friends of mine, they're smart, they're very smart. I mean, they are hand-picked in terms of business brain power and quality of human being. And I really think that, you know, we have the best board in the country, but the people who want to make their evaluations by checklist, you know, whether either in terms of diversity or in terms of supposed independence -- although I don't know how anybody that's getting half of their income from board memberships is going to be independent, you know, we don't -- we may not stack up so well, but - but it's - it's a kind of board that I want to have, knowing that if I die tonight that virtually everything I have goes to a foundation. I want the foundation to have as much money over the years to spend as possible, and there's no group of people I'd rather have in charge of the decisions subsequent to my death than the people that we've got on our board.

Charlie Munger: The correct system is the LAU Brook system. LAU (inaudible) three different cabinet appointments if I remember right. Said no man was fit to hold public office who wasn't perfectly willing to leave it at any time. And the fellow who wrote didn't approve of something the government asked him to do; he could always go back and be the most sought after lawyer in the world. He had an identity to go back to and he didn't need the government's salary. And I think that ought to be more the test in corporate directorships. Is a man really fit to make tough calls who isn't perfectly willing to leave the office at any time? My answer is no.

Warren Buffett: Yeah, we have one of our directors who was -- who's been removed twice from compensation committees of other corporations because he had the temerity to actually question whether the compensation arrangement being suggested was the appropriate one. I mean, it - it's not -- it's being put on the comp committee of American corporations, as I've said, they're not -- they're looking for Chihuahuas and - and not Great Danes and Dobermans and -- and I hope I'm not insulting any of my friends that are on comp committees.

Charlie Munger: You're insulting the dogs.

Warren Buffett: The degree to which the administration or other people are worrying about the deficit and Social Security, 25 years out when they have a \$500 billion deficit excluding the Social Security surplus now, I mean, it just strikes me as nonsense. Here we are deploring something that's going to happen in 20 years that's a fraction of what is happening right now while they're cheering, you know, basically. And Charlie, what do you say?

Charlie Munger: Well, that's the view from Berkshire's Democratic chairman. And the odd part of Berkshire on this issue was that the right-wing Republican who is speaking feels more strongly than Warren that the Republicans are out of their cotton-picking minds to be taking on this issue right now. Remember that the annual meeting of Berkshire as it has evolved is without an equal or precedent in the

history of the world. No capitalist enterprise had ever had an annual shareholders meeting anything like the one we have. We just morphed by accident into this enormous event that everybody loves so.

Warren Buffett: Charlie is the best partner a guy could have. Now, Charlie is -- he's in Los Angeles, I'm in Omaha, and Charlie has got multiple other interests, but anytime on anything important that I want to have the world's best brain working on-- and he can usually get the answer in about 15 seconds-- I can pick him up and talk to him about. He understands everything about me; he understands everything about Berkshire. He doesn't spend all day thinking about it like I do. He's got plenty of other thing he does. But when he's needed, he's there and he's right.

Charlie Rose: Berkshire Hathaway is now \$140 billion company. It began when Warren Buffett came back from New York after working with his intellectual mentor Ben Graham. When you came back from New York in '56 --

Warren Buffett: '56.

Charlie Rose: -- I think it was. Having studied and worked with Ben Graham, what was the dream? What was the ambition?

Warren Buffett: Well, it was kind of disgustingly low. I - I didn't know what I was going to do. I had about \$150,000 at that time, and I felt, you know, if I earned 10 percent it would be \$15,000 a year and I could live big on that at the time. I was - I was interested in reading and taking courses at the university. I took my father-in-law's course in psychology, and I thought I might go to law school. I knew there were a whole bunch of subjects I wanted to read about, and then I sort of stumbled into this partnership a few months later because seven members of the family said we want to -- we want you to handle our investments and I didn't want to do it one at a time or tell them what I was doing so I put the seven together in a partnership that had \$105,100 in it. You can guess who the \$100 was.

Charlie Rose: Yes.

Warren Buffett: And - and I thought that was it. And a few months later, a fellow named Homer Dodge, who had been a stockholder at Graham-Newman came out, saw me in Omaha and he said -- Graham Newman was liquidating and - and he said he'd asked Ben where to put his money and Ben said maybe Warren would be a good choice. So he joined me for I think about \$100,000 at the time. And then four months later, some fellow in Omaha that read the legal notice actually, a friend of mine called me up and said what are you doing? And I told him and he did it. So I just kind of stumbled along.

Charlie Rose: You kind of stumbled along --

Warren Buffett: Yeah.

Charlie Rose: -- all of a sudden you have a partnership . . .

Warren Buffett: Right. I've never --

Charlie Rose: -- and you're making money.

Warren Buffett: And I couldn't sell (inaudible) now, but the partnership did well, and part of the partnership was buying what looked like cheap stocks, Berkshire Hathaway looked like a cheap stock. It wasn't a very - it was a terrible business.

Charlie Rose: What was your ambition then? Now you have a vehicle.

Warren Buffett: Yeah. Well, I started out by thinking I was a textile expert, but I was disabused of that notion fairly fast. I really did. I thought, you know, well, you know, what do these guys know about making textiles? They've only been doing it a few hundred years - I mean the Egyptians, I think, figured out how to weave. So, but I --

Charlie Rose: You've been in Omaha for a while or --

Warren Buffett: That's right.

Charlie Rose: I know a little bit about it.

Warren Buffett: Just turn me loose in the plant and see what happens. So, anyway, what happened was right at that period the textile business was good for a very short period of time, and so I was like a duck floating on a pond when it was raining. I was going up in the world, but I thought it was because I was flapping my wings but it was that damn rain that was coming down. And - and then when it quit raining, I mean I found out what do I know. Right.

Charlie Rose: Yes.

Warren Buffett: And then - then we went into other businesses.

Charlie Rose: Yeah. And what -- so all of a sudden -- I mean, was it -- you went into other businesses, many -- you have some cash flow coming in.

Warren Buffett: We had some cash, not - not very much.

Charlie Rose: Yeah.

Warren Buffett: But we had some cash around, and when Jack Ringwalt decided to sell his insurance companies in early '67, we paid \$8.7 million, I think. \$8.4 million I guess it was. \$8.4 million, and we had -- in Berkshire we had, I don't know, maybe \$4 or \$5 million around. Maybe we borrowed a few million.

Charlie Rose: But that was your first entry into the insurance business?

Warren Buffett: That was the insurance --

Charlie Rose: Why was the insurance business attractive?

Warren Buffett: Well, it - it does control money and - and - and if you've got somebody that's doing a decent job on the insurance end and underwriting, it gives you money to invest on my end.

Charlie Rose: How much of your revenue comes from the insurance business?

Warren Buffett: Well, a lot comes from insurance, and then we have a lot of money that's generated by insurance.

Charlie Rose: Yes.

Warren Buffett: Insurance has propelled our growth, there's no question about that.

Charlie Rose: Because it gave you money to work?

Warren Buffett: It gave us money to both invest in marketable securities and also money to buy businesses outright.

Charlie Rose: And then in 1965, you have a chance to take over.

Warren Buffett: Right.

Charlie Rose: Berkshire. What happened?

Warren Buffett: After I while I realized what a lousy business I was in and we didn't get out of the textile business but I decided that - that to the extent we could, we'd try to add on other things. Interestingly enough, Charlie, I would have been better off if I did all the subsequent things without putting them in Berkshire originally. We just talked financially. Berkshire -- the textile business was a drag for 20 years, so if I instead of buying these things for Berkshire we just bought them in the separate entity, the --

Charlie Rose: Then why didn't you do that?

Warren Buffett: I don't know. But - but it worked out fine. And I've got --

Charlie Rose: But everything worked out.

Warren Buffett: Yeah.

Charlie Rose: If you look back --

Warren Buffett: Looking back, it was - it was - it was a big fundamental wrong decision from a financial standpoint.

Charlie Rose: To get involved in the textile business at all?

Warren Buffett: Yeah. I should have just gotten out of that and going on and done these other things, but -
-

Charlie Rose: But you tell me why you didn't?

Warren Buffett: I kind of stick with things.

Charlie Rose: It's that?

Warren Buffett: Yeah, I mean you do. Here are the things -- It's just my personality, you know? I mean, I'm driving a car after eight years, I'm living in the same house after 47 years.

Charlie Rose: Your net worth about that time was about \$6 or \$7 million.

Warren Buffett: That probably is about right, yeah. That's probably around right, because in 1962 when I formed - when I put all the partnerships together, it was about a million and when I wound up it was about \$25. So, it probably was.

Charlie Rose: What are you thinking? I mean I'm just going to continue finding investments that I can make and everything will turn out all right?

Warren Buffett: In the mid '60s, I was running this partnership. So, I thought I was going to keep running --

Charlie Rose: Right.

Warren Buffett: -- the partnership, and then I - I got to where I didn't think I could do that well and --

Charlie Rose: Why did you think that?

Warren Buffett: Well, the market in the '60s --

Charlie Rose: Oh, the stock market.

Warren Buffett: The stock market just went crazy and - and it was a little like, you know, in 1999 and 2000. I mean, I was left behind and I didn't want to do things I didn't understand and that didn't make sense to me, but I also didn't like sitting there while everybody else was, you know, running rings around me, and my partners were probably not saying it but they might think, you know, has this guy lost it? So - so I gave them all the money back and I gave them the shares at Berkshire and got a lot of them myself as part of that. And then I -- I just kind of got more involved in Berkshire. You know, it - it became my painting. I was only painting an hour or two a day at the start and I started painting like crazy.

Charlie Rose: So you had a stake in Berkshire.

Warren Buffett: Right. And I actually bought more, but I just decided I'd put all my money in Berkshire and ride with it.

Charlie Rose: And ride with Berkshire as a vehicle, just as a vehicle?

Warren Buffett: As this is - yeah, as a kind of an extension, a corporate extension of me.

Charlie Rose: And are you out of the textile business by then?

Warren Buffett: We got out of it -- No. We did not get out of the textile business for 20 years. I even bought another textile company. I mean, this is a-you know, I'm going to confess, I --.

Charlie Rose: Yes.

Warren Buffett: This is like - this is like a revival meeting now. I'm - I'm going to just go up to you --

Charlie Rose: We need that.

Warren Buffett: Forgive me, will you, because I -- I - I bought another textile company. I bought something called Wamback (ph) Mills in Manchester, New Hampshire.

Charlie Rose: Why did you do that?

Warren Buffett: Only my psychiatrist knows. Again, I thought I was going to solve something by doing it. Maybe I --

Charlie Rose: Solve something?

Warren Buffett: Well, you know, I thought that these two put together would do better or some crazy thing, I mean. I did it myself, too, no management consultant told me to do it. So it was - it was 19-about '85, I mean 20 years later before we got out of --

Charlie Rose: The textile business?

Warren Buffett: We got out of the textile business. And I said it's a little bit like watching a parade with all these other textile companies, and you stand up on your tiptoes and then everybody else stands up on their tiptoes and all -- you don't see any better and your legs hurt. And that's what happened with textiles.

Charlie Rose: In 1973 was maybe your first big -- first run at the "Washington Post," you began to buy shares.

Warren Buffett: Yeah.

Charlie Rose: How did you come to the conclusion?

Warren Buffett: I'd looked at the prospectus in 1971, when Charlie and I first met Katie Graham one time, and they were going public, right at the time of the Pentagon Papers. And then in 1973, the stock got very cheap because their television licenses were under challenge by Bibi Rebozo (ph), Nixon's friend. And then the stock went from I think like \$38 to \$16 or so in a very short period of time. And when it got down to around 20, just in a few blocks, we bought almost 10 percent of the company, and that now is about 18 percent because they've repurchased shares. When it got to about \$20, that meant the whole Washington Post Company-- it had 4,800,000 shares -- the whole Washington Post Company was selling for \$100 million. Now they owned the "Washington Post," they owned "Newsweek", they owned four big network television stations --

Charlie Rose: Including Washington --

Warren Buffett: --

Cbs In Washington: Jacksonville, Florida.

Warren Buffett: I mean everything, and they didn't owe any money. And if you had taken those separate parts, you literally could have been out in the middle of the Atlantic Ocean, you know, at midnight in a row boat and you could have sold them for \$500 million. People would have been swimming out in shark-infested waters if necessary to buy them.

Charlie Rose: And you could have had all of it for \$100 million.

Warren Buffett: For \$100 million. And you weren't going to get all of it, but - yeah.

Charlie Rose: Here's what I don't understand. How come 95 people didn't see that?

Warren Buffett: It was amazing. We were buying it from big institutional investors. And they were bailing out of it. And if you'd asked any one of them what the pieces were worth, they would have said something close to what I would say, but they thought the stock was going to go down. So - so what? You know. And the stock did go down. In fact, after we bought it, it went down a little more.

Charlie Rose: So what? Warren Buffett believes that I'm not looking at the price of the stock; I'm looking at what the value of this is.

Warren Buffett: I'm looking at the property, and I'm looking at the Graham family. I mean, that stock we paid about \$10 million for is probably worth \$1.5 billion or more today. And they haven't --

Charlie Rose: \$10 million into \$1.5 billion?

Warren Buffett: 1.5 billion. And they haven't struck oil, they have not invented a cure for cancer. You know, they've just taken those properties and kept doing reasonably intelligent things and sometimes very intelligent things, but the money generated by it, and they've developed the properties they've had and they've been terrific stewards of the money. But there's -- there's no miracles involved.

Katharine Graham: Warren bought into the company without my knowing, and that's why I say luck really plays a role in people's lives. It just does. A lot of people said stiff arm him, he's buying too much stock, he means you no good. And my native instinct was, let's take a look. Let's see what he's like. And everything I learned about him was very good. So I asked him to come and take a look at the company in which he just bought these shares. He had to write me a letter when he owned 5 percent of the company saying "Dear Mrs. Graham, I just bought 5 percent of your company, and I mean you no harm. And I

think it's a great company and I know it's Graham owned and Graham run, and that's fine with me." And so I got to know him and I thought, whoa, this guy's really terrific. So after he joined our board, he used to come to board meetings with about 20 annual reports and he would take me through these annual reports. I mean, it was like going to business school with Warren Buffett.

Charlie Rose: You couldn't have a better teacher.

Katharine Graham: No, it was wonderful.

Charlie Rose: Kay Graham told me that you did -- when she met you, she'd never even understood how to read an annual report, but that's what you brought to her, some sense of being - and helping her come to grips with the idea of making business decisions.

Warren Buffett: Kay was very, very smart but she thought -- because she -- this had been pushed into her by her mother and her husband to some extent in the past, she - she thought only males who had been to business school could run businesses. I mean, she - she had been -- She had the intellect; but she didn't have the confidence. And I told her my job was to get her away from looking into that funhouse mirror that she was looking into about herself and distorting it and looking into a real mirror. And when she looked in the real mirror, she'd see a person who was perfectly capable of running the "Washington Post" or any other company.

Charlie Rose: How long did it take her to learn that?

Warren Buffett: Well, it was, you know, fits and starts over time.

Charlie Rose: Yeah.

Warren Buffett: But - but she -- I had the right raw material. I mean she was good. She was good. And - and she'd had beaten into her over such a long period of time that that wasn't what she could do in life, that it took some convincing. And she had to see evidence of success and all that sort of thing. I said, Mrs. Graham, I said, you know, you control this company lock, stock, and barrel, but you're still worried about me. So I said what you're doing is you're looking at me and you're seeing fangs and I'm telling you these are baby teeth. And I said, they really are baby teeth, but they always look like fangs to you and there's nothing I can do except even - except take them out. I said even though they're baby teeth, I'm going to just take them all out. So I'm probably willing -- you call George Gillespie up here, your lawyer, and I said I'll sign an agreement that I'll never buy another share of stock in "Washington Post" unless you give me the OK, and I said I'm fine -- I want you happy with me. I don't want you nervous about me. And so George came up and I took out the baby teeth and she saw fangs falling to the floor and we got along great ever since.

Charlie Rose: OK. But then - but you already had --

Warren Buffett: We had - we had --

Charlie Rose: -- 10 million invested or not?

Warren Buffett: Yeah, we had \$10 million invested. We had nine - we had 9 percent -- nine and a fraction percent of the stock. And I told her the smart thing is to repurchase your shares. I mean - and the shares I would otherwise buy you should buy for the company, and - and we'll all get richer if you do that. And - and she had a lot of other people advising her otherwise, but she finally -- she decided to do it and that's the reason we now own almost 18 percent, I believe, of the company instead of nine and a fraction percent. The "Buffalo Evening News" was bought in 1977 --

Charlie Rose: '77.

Warren Buffett: And I gave Kay first shot at that.

Charlie Rose: You did what?

Warren Buffett: I gave Kate first shot at that.

Charlie Rose: You said, I'm - if you - if you don't want to buy it, I am.

Warren Buffett: If you don't want it - yeah, I'm going to buy it.

Charlie Rose: Why would you do that?

Warren Buffett: I just felt that, you know, she'd been good to me and - and we were a big holder and they were in the newspaper business, and - and she wanted to buy things. So I just said, you know, I'm not going to - I'm not going to fight. Then I went up to see Vince Mann (ph) on a Sunday and bought this thing away from you, so -- that she otherwise would have bought, so I gave her a shot at it.

Charlie Rose: In 1983, you purchased Nebraska Furniture Mart --

Warren Buffett: Right.

Charlie Rose: -- for \$60 million.

Warren Buffett: Mrs. B.

Charlie Rose: Tell me about her.

Warren Buffett: She was the woman that walked out of Russia, got on a peanut boat, landed in Seattle with a tag around her neck, couldn't speak a word of English, and the Red Cross got her out to Fort Dodge, Iowa, which is what the tag said. She couldn't learn the language. She moved to Omaha, because there were more Russian Jews here that she could talk with. Her oldest daughter started school, came home and taught her the words that she learned. She took 16 years to save \$500 so she could start this company, selling used clothing, bringing her siblings and her mother and her father over here at \$50 at a crack, and in 1937 took \$500 and went into business and competed against all these people who had all kinds of advantages over in every way, and she killed them. And --

Charlie Rose: She killed them?

Warren Buffett: Yeah.

Charlie Rose: How was she able to kill them?

Warren Buffett: She heard about -- she was smart. She knew the limitations of her knowledge and she - she was confident within her circle of competence. She didn't get outside of it and she took care of her customer, she sold cheap, and it took her a long time, but she built the largest home furnishing store in the country in a town like Omaha with 700,000 people.

Charlie Rose: So, how did you come to buy it?

Warren Buffett: Well, I was in love with this operation. I mean, that's my kind of woman. I bought it when she was 89. She worked until 103. There was a period there where she left for a couple of years. If you went over to Mrs. B's house as I did, and you -- very nice house and you'd go in and on her sofa, her lamps, her bed there would be little green tags hanging down, because it made her feel like she was at the

store. I mean, this is a remarkable, remarkable woman, and the punch line, Charlie, is, she couldn't read or write. And I - and I think every business school in the United States ought to study her. I mean --

Charlie Rose: What would they learn?

Warren Buffett: They would learn the essence of business. They would learn that taking care of your customer is what it's all about. Taking care of -- and by that I mean giving them good deals, you know, which nobody would touch and she -- and working, working like crazy. I mean, she was there day after day after day and she - she - she had a passion for it. And the truth is, if you took the "Fortune" 500 CEOs and I gave you first draft pick on 10 of them, and I'd put them in competition with Mrs. . , she'd have -- she'd win.

Charlie Rose: No doubt?

Warren Buffett: She'd win. Yeah. Michael Eisner was here, I told him the story, he loved it, and Michael wanted to - to get the movie rights. And Michael could be very persuasive, but - but I saw him stand there with Mrs. B's daughter, the same daughter I referred to earlier, you know, who's now -- who at that time was probably close to 80 or so, and - and Frances is this tall and Michael is that tall and Frances is saying "My mother wants a piece of everything." When you're an 80-year-old saying your mother wants a piece of everything, I mean --

Charlie Rose: That's great. So Mrs. B. - Mrs. B wanted them -- whatever they were going to do --

Warren Buffett: Whatever --

Charlie Rose: -- she wanted a piece of the action herself.

Warren Buffett: If they were going to make Mrs. . dolls, she wanted to own a piece of that.

Charlie Rose: And they didn't teach that in any business school to her? She picked that up from --

Warren Buffett: That's right. That's exactly right.

Charlie Rose: -- from understanding ownership was everything.

Warren Buffett: She understood business. She understood people awfully well, too.

Charlie Rose: In 1988, you started buying Coca-Cola. How come?

Warren Buffett: I don't remember exactly. Probably I read their annual report. Probably read the 1987 annual report. I'd been -- I'd watched it some. But there just comes a point, there's a tipping point, you know, in terms of knowledge you've accumulated over a period of time, price changes in the stock which had gone down some. There were heavy repurchases of their own stock. Roberto (ph) and Don (ph) were doing a terrific job. Nothing bad was going to happen to Coca-Cola, so I started buying it. Most of that in that period from the middle of '88 to early '89, but then a little program, but we put overall about \$1 billion into it and it's probably worth about \$8 billion now.

Charlie Rose: And you have no intent to sell?

Warren Buffett: No.

Charlie Rose: You have said, though, that in -- during the bubble --

Warren Buffett: It got overpriced.

Charlie Rose: There were some things that you might have sold

Warren Buffett: Sure.

Charlie Rose: -- and would have been wise to have sold them at that time.

Warren Buffett: If I was running the partnership like I did back in the '60s, I definitely should have sold those stocks. I mean, they -- stocks went crazy, and --

Charlie Rose: But you do not today look back and say "I should have sold Coca-Cola when the bubble was there", because

Warren Buffett: It just -- it wasn't me. I mean, I wouldn't -- you know, I - I -- I knew it was selling at a very fancy price and I even wrote about it, same way with Gillette, but -- but, you know, I - I don't do that very often. I'm not saying I wouldn't ever do it. I mean, if we went into the wildest speculative orgy in history - orgy in history and some of these things went crazy, maybe I would sell some. But I - it's not mine -- it goes against the grain. For one thing, wonderful businesses are not that common. And if you get a big position in a wonderful business, not a bad thing.

Charlie Rose: What is this single best investment on a large scale that you have made?

Warren Buffett: Geico, twice in my life. Three times in my life has been a good investment. I mean, it was a good investment when I was -- when I was really 20 years of age and when I -- when I bought -- I put three quarters of my net worth in - in Geico when my net worth was, like, \$10,000. And - and that caused my net worth probably to double or something like that. And that was - that was great at the time. In 1976, the company got in trouble, and we bought what turned out to be half of the company for, like, \$40 million. And then in 1995 or so, we bought the other half for \$2 billion. And that was a good deal. So it's been a triple play.

Charlie Rose: Help me understand this. You -- you're sitting with more than \$40 billion essentially in cash --

Warren Buffett: Right.

Charlie Rose: You could buy some big businesses, I would assume, for \$40 billion --

Warren Buffett: Right.

Charlie Rose: -- but you don't see any at a price that you want to own?

Warren Buffett: That's right. And - and when I look at the deals that have been made in the last year, there's not one I'm envious of. So I mean, it isn't like we missed them. It may turn out that - that I should have bought one of them, but I mean there's none that I feel, gee, I wish I'd bought that last year. But I hope I'll buy one tomorrow.

Charlie Rose: I mean if there's nothing, you know. You don't look at General Motors and say --

Warren Buffett: I look at General Motors. General Motors is selling for about \$15 billion now. There's 500 million shares; 28 or 29 something like that. You know, and the whole General Motors company, \$15 billion, and of course, that was the most powerful company in the world, you know, back when I was a kid, Charlie.

Charlie Rose: And you could - you could have it in a second.

Warren Buffett: Well, I don't know about that. But - but I certainly could buy - I could buy plenty of it.

Charlie Rose: What don't you know about that?

Warren Buffett: Well, I mean I -- buying the whole company is a different story.

Charlie Rose: How much is the whole company?

Warren Buffett: The whole company would cost \$15 billion, 100 percent of the stock.

Charlie Rose: So why couldn't you pay \$15 billion and get General Motors?

Warren Buffett: Well, they might not like me doing it and some other things --

Charlie Rose: Oh, sure, sure. I understand.

Warren Buffett: But nevertheless, I could buy a lot of stock at a valuation of \$15 billion.

Charlie Rose: And you think it's a good buy today?

Warren Buffett: I think it's too tough to figure.

Charlie Rose: Too tough to figure?

Warren Buffett: Yeah. You know, it is a company that sells 25 percent of all the vehicles in the United States and one seventh of all the vehicles in the world and employs hundreds of thousands of people, but it's got some terrible obligations outside outstanding.

Charlie Rose: Like Fiat or --

Warren Buffett: Well, Fiat's I probably -- well, the Fiat deal they solved for \$2 billion. But still \$2 billion out the door.

Charlie Rose: Things like that.

Warren Buffett: But the big problem was that they really entered into contracts with the UAW that were based on their -- the economics of market dominance, and they don't have market dominance anymore. But they still have got the contracts. And I don't blame the UAW. I mean, you know, it was a free will negotiation, but they signed up. I think they're paying like two and a half people that don't work for every person that works or something like that, you know, in terms of retirement and health care, and that gets to be crushing if you're competing with people that don't have the same obligations.

Charlie Rose: You've looked at this closely.

Warren Buffett: Oh, I look at all the things.

Charlie Rose: When you read eight hours a day, you have a chance to cover a lot of --

Warren Buffett: Yeah. But General Motors -- listen, I think they're doing a great job considering the hand they're dealt. But General Motors is a huge annuity and health insurance company with a major auto company attached. And unfortunately, the huge annuity and health company has got a terrible bunch of contracts on them. It is worth some big minus number. And the question is whether the auto company is worth a big enough plus number to offset that big minus number. But you can't separate the two.

Charlie Rose: And you can't figure it out?

Warren Buffett: Well, I can figure it out, but I can't --

Charlie Rose: No, no, you can't what?

Warren Buffett: Well, in the end I can't come to a conclusion that it's obvious that --

Charlie Rose: Well, that's what I mean. You can't come to a conclusion?

Warren Buffett: Right.

Charlie Rose: Because you don't have all the facts or --

Warren Buffett: No, I've got the facts.

Charlie Rose: What don't you know? Why can't you reach your conclusion?

Warren Buffett: I don't know whether you can exist with the kind of obligation they've got and 25 percent of the market and very tough people like Toyota and all kinds of people coming at them who don't have those costs, they call them legacy costs.

Charlie Rose: Here is the dilemma. You've got \$40 million in cash.

Warren Buffett: \$40 billion.

Charlie Rose: \$40 billion, I'm sorry.

Warren Buffett: There's a difference.

Charlie Rose: There's a difference. And you've gotten so big that you've got to make a big play.

Warren Buffett: Right.

Charlie Rose: That's your problem.

Warren Buffett: That's my problem. And I thought it was a problem when we were a lot smaller, and it was, but it's a bigger problem now. And if I'm lucky, it will be an even bigger problem five years from now.

Charlie Rose: And you.-- so tell me how the dilemma plays itself out for you.

Warren Buffett: The odds are good, Charlie, that one way or another we will find reasonably intelligent things to do with most of the money. But they won't be as intelligent as the things that we could find 30 or 40 years ago with much smaller amounts of money. Nowhere close to that.

Charlie Rose: Because there are fewer there.

Warren Buffett: Right. It just won't happen.

Charlie Rose: What's the test? What test does it have to meet?

Warren Buffett: It has to be a business I understand. It has to be a company that I think has some kind of enduring competitive advantage. It has to be a management that I like and trust, and it has to be a reasonably attractive price. Price is the least important, but it's still important.

Charlie Rose: And you'd like to own all of it?

Warren Buffett: I'd like to own all of it.

Charlie Rose: But not necessarily?

Warren Buffett: But not necessarily.

Charlie Rose: A very small -- that's a small field to --

Warren Buffett: It's a small field when you get to have as much money as we have. It was a big field 30 or 40 years ago. When I bought the Washington Post stock in 1973, and '74 there were hundreds of companies that met my test. It was just a question of..

Charlie Rose: Choosing the best.

Warren Buffett: Deciding. Absolutely.

Charlie Rose: And the one you liked the most, the combination.

Warren Buffett: Yes.

Charlie Rose: You don't have any single candidate right now?

Warren Buffett: That's true. That's why you see these tears in my eyes.

Charlie Rose: It is. Tell me the emotional feeling.

Warren Buffett: No, no, no..

Charlie Rose: I don't mean tears, but there is a certain sense of --

Warren Buffett: It's happened before. I mean, I closed up my partnership in '69 because I didn't feel there were any opportunities then in what I was doing, managing money, and there weren't. I mean, at least for me. And, you know, in 1990 and in 2000 in the general stock market, there was certainly nothing attractive and we found some businesses then. But it happens from time to time. I mean, I am not in a business where you can do something smart every day. I'm not even in a business where you can do something smart every year. But I may be in a business where you can do something smart every three or four years.

Charlie Rose: But I read every day about one more big deal by a group of private equity guys in the paper today.

Warren Buffett: Right. And they're using other people's money, and they get an override (ph), and their calculus is not the same as my calculus. And right now that enables them to pay way more.

Charlie Rose: Tell me how their calculus is different.

Warren Buffett: Well, they just -- it's money that they get from somebody else that they get paid quite a bit of money on if they don't do anything, and then they get a percentage of the upside and they don't take the down side. That is a different calculus than Berkshire's.

Charlie Rose: You have the upside and the downside.

Warren Buffett: The upside and the downside, and I'm going to keep them forever and I'm not going to dress up the accounting or rearrange things a little and resell it --

Charlie Rose: And not going to take a big fee for doing it?

Warren Buffett: No, so I don't have an exit strategy, and I'm not getting paid just to sit with a whole bunch of other people's money. It's my money.

Charlie Rose: We sat down again with Warren on June 29th, 2006, after he had made some acquisitions since we last spoke with him. Let's talk about the future of Berkshire Hathaway.

Warren Buffett: Right.

Charlie Rose: The last time we talked about the rise of Berkshire Hathaway, you were sitting on, give or take a billion dollars, about \$44 billion. You didn't find anything that you were very interested in making an investment. Since then, you've made some investments.

Warren Buffett: Yeah, we've spent over \$10 billion this year.

Charlie Rose: One was Iscar.

Warren Buffett: One was Iscar, which was \$4 billion, 80 percent of a \$5 billion business. Pacific Corps was five and a fraction billion. And we're finding a few things. The important thing is to find big things.

Ok: I'm looking for elephants.

Charlie Rose: But my question is, did anything change between, say, 2004 and 2006? I mean, because you don't look at the economy as much as you look at the business.

Warren Buffett: I only look at the business. There's never been a business that I've passed up that I liked because I had some view on the economy that maybe it would be better next year. There's never been one I've bought because I thought the economy was going to do particularly well this year. You know, I look at -- I look at a business, we're going to hold it forever. If I hold -- let's say I live 20 years. That's pretty optimistic, but let's just say I do. In those 20 years, there can be a lot of good years, there can be a few bad years in the economy, but what difference does it make? It's like playing 18 holes of golf. There's some par threes and par fives, and the only way to get to the clubhouse is to play them all. If you like golf, you play them all. I like business. So we're going to play the tough years, we're going to play the easy years. And if we got the right businesses and the right managers, it's going to work.

Charlie Rose: Why couldn't you have seen Iscar in 2004? Because it was just that company. Nothing happened to them, or nothing happened to you to make the investment in 2006 rather than 2004 except the CEO wrote you an e-mail.

Warren Buffett: That's right. I've never heard of the company in 2004. Very hard to do it if you haven't heard of the company. And I'd never heard of Eitan Wetheimer. But he wrote me a letter --

Charlie Rose: This is the guy who was the CEO.

Warren Buffett: He's the CEO and the owner and his family. And he wrote me in October of 2005. And he said -- he told me a page and a fraction about the company, and he said Berkshire's a logical home for us. And he said, I'd like to talk to you. So he came over from Israel and we talked. But if he'd written me in 2004, we would have made the deal. It would have been cheaper, too. It would have been cheaper in 2004.

Charlie Rose: But my point is understanding why you didn't see companies was nothing having to do with the economy, nothing having to do with anything other than you just simply hadn't seen one.

Warren Buffett: Yeah. Yeah. It's availability. It's availability. Sometimes it's something that happens in a family, you know, there may be more people or they may owe taxes or who knows what. I mean, we buy when they're ready to sell. And I don't go out prospecting. I let my interests be known, but I get a lot of people saying why don't you call in this person, why don't you call on that one, you know, soften them up. You know, and I don't do it, because my batting average would be terrible. You'd just -- you've got to wait until they're ready to do something. And that's when we hear about companies.

Charlie Rose: They come to you when they're ready?

Warren Buffett: When they're ready. My phone rings.

Charlie Rose: At this stage in your experience, you know pretty quickly if it's right.

Warren Buffett: Yeah, like about two minutes. I read the letter from Kathie, I knew it was right. You can tell. Have you ever met girls, Charlie, that you knew it was the right thing? I mean, I don't want to get personal, but there's some, you know --

Charlie Rose: And you know that other people would like them, but it's just not for you.

Warren Buffett: They're just not for you. They're just not for you.

Charlie Rose: Yes, exactly. But that has to do with -- I mean, you can see the numbers immediately, you've got to make an evaluation of the management. How can you do that so quick? You just have at this time in your life an instinctive knowledge.

Warren Buffett: Yeah. It's not going to always be right, but it's usually going to be right.

Charlie Rose: One more time for the criteria. It is, in terms of earnings that --

Warren Buffett: We're looking at earning \$75 million pre-tax.

Charlie Rose: \$75 million. You're looking at management, you're looking at --

Warren Buffett: A simple business, one I can understand, which really means simple. And we're looking for management in place, and we're looking for a seller that knows the price he wants for his business.

Charlie Rose: The seller must know the price?

Warren Buffett: Yeah.

Charlie Rose: Is it a hard negotiation or is it pretty quick?

Warren Buffett: Very quick, because they know -- I mean, if I like the price -- if it meets the test, I can say yes very fast. I mean, it doesn't take any time really, Charlie. Now, there's others if I spent two years on them I wouldn't know the answer at the end of two years, but I do know the difference between the ones that take two years and the ones that take two minutes.

Charlie Rose: And you like the ones that take two minutes?

Warren Buffett: Yeah.

Charlie Rose: And you don't go to some investment bank to do the due diligence?

Warren Buffett: No. No. If I need them -- you know, I need a doctor maybe to tell me about my health, but if I need them to tell me about a business, they ought to be running Berkshire. I did not take money

from 400,000 people to essentially start farming it out and say, well, I lost your money but this guy, I thought he was good. He just happened to be wrong. It's my job to know what I'm doing. And if I don't know what I'm doing, I don't do it.

Charlie Rose: Well, we have established that you know what you're doing.

Warren Buffett: No, no, not always.

Charlie Rose: Coca-Cola is one example. The value of your holding has gone down by about \$8 billion, haven't they?

Warren Buffett: That's -- you hit it right on the button. Let's keep this quiet.

Charlie Rose: I mean, does it ever -- do you ever say, man, what am I doing here? My commitment to the end is --

Warren Buffett: No, I -- looking back, I made a mistake by not selling Coca-Cola stock when the stock was \$80 a share or something. Yes, but I don't look back on things.

Charlie Rose: OK, but let me just stay with that idea. So you look back and you say when it was \$80 a share I should have sold it, because that was at its top, say, or close to its top.

Warren Buffett: Fifty plus times earnings.

Charlie Rose: Fifty times earning. But it's not in your blood to want to sell.

Warren Buffett: No. But I do sell marketable securities sometimes. I don't sell businesses. But I do sell marketable security.

Charlie Rose: Sure, and this is a marketable security.

Warren Buffett: That was a marketable security.

Charlie Rose: As is American Express. As is --

Warren Buffett: Yes. But I don't sell See's Candy or the Buffalo News. I don't sell businesses.

Charlie Rose: So you're married to them for better or worse?

Warren Buffett: Yes. I've got one section in the annual report and I put it in every year, that if a business like that promises to lose money indefinitely or if they have major labor problems or something, but just because I don't think it's going to do very well or I could use the money better elsewhere or because I get offered a crazy high price for something, I don't sell them. I got offered a crazy high price for something here recently that we own, and I told the fellow that called me. I said, "I don't do it. You can look in the back of the annual report, and you'll see, I don't do it." And he said "well, I read it, but I didn't believe it." I said "Believe it now."

Charlie Rose: He thought he could buy it.

Warren Buffett: He (inaudible). He named a number to me.

Charlie Rose: And it was a good number?

Warren Buffett: It was a good number. If I was the trustee of a children's home and that was the only asset of the children's home, and it was my responsibility simply to get the best economic result for the children's home, I would have had to sell it to them.

Charlie Rose: Exactly. Since I last talked to you, you have with the consent with the -- in concert with the other members of the board, have chosen the successor?

Warren Buffett: Well, what we have, Charlie, is we have three that could do it, and every meeting of the board -- we don't have many meetings, but every meeting of the board, that's the subject. And the question is, if something happens to me that night, who do they put in charge? So they always go away knowing what they would do the next day. Now, there's -- there may be a pool of three, but we have settled on one at any time. And so if something happened to me tonight, tomorrow morning the board of directors at Berkshire would convene and they would know exactly who they were going to put in charge.

Charlie Rose: You will run Berkshire as long as --.

Warren Buffett: As long as I keep my marbles.

Charlie Rose: And you have somebody that will come to tell you that you don't have them if necessary?

Warren Buffett: Well, I -- yes, I've assigned that job to my children. I tell them they are better off if all three come in together, because if just one comes, I'm cutting them out of the will.

Charlie Rose: You have said that you want to keep -- if you could find \$30 billion in acquisitions, you're prepared to do that. You just want to keep in reserve \$10 billion.

Warren Buffett: About \$10 billion, yes.

Charlie Rose: Now, why that break-up? Why the divide?

Warren Buffett: I think the company that writes the catastrophe insurance and all of that sort of thing that we do should have plenty of liquidity. I want Berkshires always to be the rock of Gibraltar. We've got 400,000 shareholders. We have got people who have worker's compensation claims against us who are quadriplegics that are going to be getting a check from us 60 years from now. I've got no business fooling around with anything close to the solvency of Berkshire. So I will keep it way, way over on the safe side in every respect, and having a lot of money around, you know, when you're in the insurance business like we are, I don't want to depend on letters of credit from banks or anything of the sort, you know? I don't want to -- no too big to fail doctrine to bail us out. I really want us to --

Charlie Rose: And \$10 billion is the right number? Thereabout?

Warren Buffett: Well, it's the right number --

Charlie Rose: Is the insurance business still as attractive to you today as it was from the beginning?

Warren Buffett: It's always been a business that sort of fits me. I mean, it gives you the money first, so it -- the investment element is important. It also is a business that, you know, you're calculating odds on things --

Charlie Rose: That's what you like.

Warren Buffett: -- and I guess I was probably destined to be a bookmaker, but my dad wouldn't let me.

Charlie Rose: You can calculate odds. But, I mean, in the insurance business, there is the increasing number of hurricanes, increasing number of terrorism as a fact of life today.

Warren Buffett: I think so.

Charlie Rose: No matter how you can write a policy against all those things, I mean, does it make it any less --

Warren Buffett: Well, you have to get the right -- you have to calculate the odds right. You've got to get the right premium. And you never know whether you've gotten the right premium. I mean, you know over a lifetime whether overall you've gotten the right premiums for things, but you lose on some policies, and on other policies nothing happens. So you don't know at any given day or week or month whether you're doing the right thing, but over time you'll see whether your judgment has generally been right. And it's an interesting game.

Charlie Rose: Has the scandal affected it at all?

Warren Buffett: No, I wouldn't say so.

Charlie Rose: All of the controversy about AIG -- I mean?

Warren Buffett: We do a lot of business. We've got a lot of different irons in the fire in the insurance business. We've got Geico, the auto insurance, so we've got a lot of different insurance businesses, and it will be the most important business of Berkshire throughout my lifetime and probably a long time thereafter.

Charlie Rose: One thing you're doing is looking to international companies. Is it for the first time?

Warren Buffett: No, I've always been interested, but we haven't been on the radar screen very much for entire businesses abroad. People did not think of us in Germany or the U.K. or -- up to now Israel if they had a business to sell. Now, I've always looked at international stocks, and we've always owned some international stocks.

Charlie Rose: Tell me how you see the economy today.

Warren Buffett: Well, the economy is still pretty good as we sit and talk today. You know, people, they've taken lots of equity out of their -- or they've taken -- they have extracted the equity that's appreciated in their houses big time in the last few years and all that. But if you looked at the economy right today, you'd have to say it's good. Now, we've got plenty of problems, but they are not manifesting themselves in business today.

Charlie Rose: Do you worry about inflation?

Warren Buffett: I worry some about inflation, sure. Sure. Inflation is never gone, it's always in remission. And, you know, it's very easy..

Charlie Rose: Never dead but always --

Warren Buffett: It's never dead. But it -- and it's something that is man-made and governments can create, and it often times seems preferable to some alternative that's in the here and now. So you have to worry about -- any time you have governments, you have to worry about inflation.

Charlie Rose: And what about oil prices?

Warren Buffett: I'm no good on oil prices. We're using 84 million barrels a day or so in the world of oil, and if something disrupts three or four million barrels a day of supply, like something happening in Iran, perhaps, the marginal barrel will go crazy.

Charlie Rose: We're on the edge.

Warren Buffett: Yeah, yeah. We've got less reserve capacity by far than we had 15 or 20 years ago.

Charlie Rose: When you think about the dollar --

Warren Buffett: I think the dollar over time will go down, because I think we're following policies that the -- in connection with trade that will cause the dollar -- I don't know whether it will be in six months, six years, 10 years, but the policies we're following as a country will cause the dollar in my view to decline.

Charlie Rose: Primarily our trade deficit?

Warren Buffett: Our trade deficit, right. And the flip side of our trade deficit is when we consume more than we produce, we have to trade the rest of the world something for that, and we give them our assets. We give them IOUs of the government, we give them dollars initially, and then they can convert those into other assets in this country. So we are trading away assets in order to overconsume.

Charlie Rose: As you said to me earlier, we're giving away pieces of the farm.

Warren Buffett: Yeah. We're giving away pieces of the farm. We want to consume more than we produce, and so we trade away a little bit of the farm. And we've got such a big farm. I mean, you know, this is one prosperous country. So we can trade away -- we don't see it day by day. But it adds up. And it has consequences.

Charlie Rose: More severe to you than the fiscal deficit?

Warren Buffett: That's true. Yeah. Fiscal, our national debt in relation to GDP is not extraordinary. We've had plenty of times in the past when it's been higher, particularly after World War II. And I don't like it when it keeps going up as a percentage of GDP, but a very rich country can stand more debt than a poorer country, and we can handle a lot more debt than in the past. Now as that debt gets to be more and more owned by the rest of the world because of the trade deficit, it can cause problems down the line. But if you -- if you ask me whether I'd rather cure one or the other, I would rather largely cure the trade deficit.

Charlie Rose: Do you accept the argument that countries like China are locked into this dance with us because they need our markets so they're unlikely to dump American securities?

Warren Buffett: Oh, yeah, if they wanted to sell American securities, if they sell them to somebody in the United States, they get dollars with them, so they have to buy something else for the dollars. If they sell them to the French, the French now have them, you know, and the Chinese have got a claim on France. But they can't really get rid of them. They can change their asset preference about the American assets they own, but China can't get rid of American assets, basically, or the rest of the world can't unless we start exporting as much to them as we're importing, and that day is not coming.

Charlie Rose: But there are people who will suggest that there may be some catastrophic day, and we had that little tremor from the South Koreans about a year ago.

Warren Buffett: There could be a catastrophic day. I don't know the answer to that. But any time you have huge imbalances in the world and you have lots of people on hair-triggers trading currencies and stock and bonds, you have the potential for catastrophic days.

Charlie Rose: Back to the fiscal deficit and your sense of where we are. A lot of people look at the budget that they see today and they look 10 years out, and they say with the baby boom generation coming in and Social Security and Medicare, that we are looking at a huge problem downstream, that either we've got to raise taxes, cut spending, or change the age of the beneficiary.

Warren Buffett: We have to change the promises. A lot of what you see coming down the road as really large looming problems revolve around promises. And we won't in my view ever change the promise on Social Security. We may change it when you get into Medicare, something of that sort.

Charlie Rose: No politician will suggest that.

Warren Buffett: No, they wouldn't. But this country has incredible resources. It has more resources per capita than it had five or 10 or 20 years ago. I mean, we're not going backwards economically as a nation, but we have made a lot of promises. And we can have a very rich family, Charlie, and our income could keep going up. But if I promised the elder members of the family that they would all live like multimillionaires, we could get in trouble.

Warren Buffett: The Gift (2006)

7/12/2006

Charlie Rose: but not quite at that level. Warren Buffett, Bill and Melinda Gates, next. On June 26th, 2006, Warren Buffett, Bill Gates and Melinda Gates came to New York to make an historic announcement, that Warren Buffett was giving \$31 billion to the Bill and Melinda Gates Foundation. The logical question is why?

Warren Buffett: It's something I've always planned. My wife Suzie and I planned that whatever I made would go back to society, and - and originally I thought she would outlive me and that she'd make the big decision on it, the manner. But - but since her death, I had to - had to rethink the best way to get the money into society and have it used in the most effective way. And I had a solution staring me in the face. I had seen Bill and Melinda do what they have done with their foundation. They've - you know they've done it with their own money. They poured themselves into it. The decisions are great. Their goals are similar to mine so - so the time is now.

Melinda Gates: Well, for us it's just fantastic because we look at it as doubling the impact. That visas we've already been working on and the education and the inequities we've been looking at for so long, just basically doubled by Warren's gift. And it's incredible the depth that we'll be able to go to on some of these global health issues.

Charlie Rose: Bill?

Bill Gates: Well, it's a huge responsibility. In some ways if you make mistakes with your own money, you don't feel as bad about it as if it was someone else's. So, now we're, you know, even more intent on doing it right. And it's a very exciting time. The advances in medicine and other things we can do to relieve poverty. We've - we've been making good progress. And with the doubling of resources, we - we think our impact can even more than double. And so it's - it's thrilling but it's a huge responsibility.

Warren Buffett: Well, I began to mull the various possibilities. And I wanted the money to be used effectively. And - and I've looked at a lot of foundations, Charlie. And there are number that I admire, but there's none that in the same class in my view as the Bill and Melinda Gates Foundation. And not just because of size. They really have looked at the world without regard to gender, color, religion, geography. And they said how can we do the most good for the most people and particularly to the people that have -- have gotten the short straws in life. And - and so I - I mentioned that I was thinking about it to Bill many, many months ago.

Charlie Rose: Yeah.

Warren Buffett: But I still was playing around in my mind the best way to do it, because I wanted something that would work well for the Berkshire Hathaway shareholders as well as for the people who were going to be the beneficiaries of the money. And - and finally I came up with this plan. And when I - when I decide on something, you know, I'm ready to go.

Charlie Rose: This friendship that led to this remarkable gift had an interesting beginning. Take me back to the first time the two of you met.

Warren Buffett: Well, he didn't want to come. Let's start with that.

Charlie Rose: You didn't want to come meet Warren Buffett?

Bill Gates: Well, I wasn't sure what I was going to talk to him about. And I was very busy, but my mom had a great group of people coming out, including Kay Graham and Warren, and kind of insisted that I come out there. So I actually took a helicopter out thinking, OK, once I've done what my mom expects, a couple of hours, I'll - I'll be back to my work. But then it was fantastic.

Charlie Rose: I want to get to fantastic. But why didn't you want to meet Warren Buffett?

Bill Gates: Well, I am --

Warren Buffett: Everybody wants -- all my life I have been looking for somebody who didn't want to meet me.

Charlie Rose: No, we found the first person who didn't.

Bill Gates: No, I was just a heads-down software engineer.

Charlie Rose: Right.

Bill Gates: And I wasn't quite sure that he'd be interested in what I was interested in. But then, you know, as soon as we met, talking about companies and trends and things, you know, we could have gone on for days.

Warren Buffett: We couldn't - we couldn't stop.

Charlie Rose: But what was that conversation about?

Warren Buffett: About everything in the world.

Charlie Rose: Business and --

Warren Buffett: Yeah, everything in the world. I was interested in what he was doing. He was interested in what I was doing, and we were both interested in what the world was doing.

Charlie Rose: How did the friendship evolve? I mean, you knew right that night there was something special --

Warren Buffett: Yes.

Charlie Rose: An affinity. What?

Bill Gates: Right. That - that it would be a lot of fun if we could have a chance to talk more and see how the world evolved. And it was just a few weeks later that I got to come to a gathering that Warren was having of a bunch of his friends and sit around and talk about things like, you know, why one session was about the companies that were most valuable in 1960 and 1970 and 1980 and how that had changed and should people have been able to see that and why those things happened, you know, why did the companies on the top not been able to maintain their strength?

Charlie Rose: Most people have -- you and I have talked about this before -- a few friends in which the friendship is so rare, it's almost beyond definition. This is one of those.

Warren Buffett: That's what you want in life. I mean, if you have a dozen terrific friends in life, I mean, you've got a great life, Charlie. That's true. And - and - and you don't get that many shots at it. I mean, you've got to - you've got to be - or that you just have to be in sync. And you know when it happens. And I've been blessed with a number of them, and then the --

Charlie Rose: (inaudible).

Warren Buffett: Yeah, absolutely. Absolutely.

Charlie Rose: Different age.

Warren Buffett: Yeah, right.

Charlie Rose: Different areas of the country. Different educational experiences.

Warren Buffett: Right.

Charlie Rose: But at the same time, it has what?

Warren Buffett: It just -- it works. We find each other interesting. We find each other funny sometimes. And I - I can't recall a time when in any kind -- I mean, we go on trips together and different things, but I can't recall a time when we didn't have a good time together.

Charlie Rose: Pull jokes on each other?

Warren Buffett: Me -- he pulls them on me.

Charlie Rose: Tell me about the time there was a dinner somewhere.

Warren Buffett: Yeah. It was in Carmel.

Bill Gates: And we had a group of friends who were traveling around the country a little bit. And we had gone to this resort, and we said to the friends that unfortunately we couldn't take over the whole dining room that night, that there was a couple who would have to sit with us because they - they traditionally always came that time of year. And so this couple started to drink a little bit, and a little insulting to the people that --

Charlie Rose: This is not the version I've heard. He was insulting, you know, the University of Nebraska.

Warren Buffett: The guy was slobbering all over everybody. And his wife was - and his wife was sitting next to me. And I wanted to punch her. And the owner had set me up for this, because he called Bill over. He said, gee, this couple showed up, you know, we weren't expecting them. Bill very graciously said, well, they can join us. So, they were getting more and more and more obnoxious. And - and the guy is sitting straight across. And at some point he says, where are you from? And I said Nebraska. And he is insulting Bill too. But he - and he says, oh, that's where the convicts play football. At that point, I just walked off --

Charlie Rose: When you insult the Cornhuskers --

Warren Buffett: Yeah, he said he was from Colorado too.

Bill Gates: He knew the fight song and made fun of it. Well, anyway, it turned out they were comedians we had hired --

Charlie Rose: You'd hired?

Bill Gates: We had prepped them for all the things that our guests might be sensitive to.

Warren Buffett: But we all fell for it.

Charlie Rose: Did you try to get back at him for that? I mean --

Warren Buffett: Who knows what I'll do.

Charlie Rose: The night is young.

Warren Buffett: You'll read about it in the paper, Charlie.

Charlie Rose: Most friendships come in a variety of ways. Is there competition here between the two of you?

Bill Gates: No, that's one thing that's nice. The only area we ever overlapped in was in encyclopedias.

Warren Buffett: That's true.

Bill Gates: And that was kind of fun, because Warren would say that his encyclopedia smells better than ours. You know, even though ours is a little CD. So, he put --

Warren Buffett: Yeah, a little

Cd A Little Cd: You were selling books and he had a little CD.

Warren Buffett: And I said we were developing this musty old smell that would kill him.

Charlie Rose: But no competition at all?

Warren Buffett: Not at all. Not at all.

Bill Gates: We have - we have a \$1 bet.

Charlie Rose: You can play - play bridge, and you play golf.

Warren Buffett: We play bridge and play golf. We have a dollar bet when we play golf.

Charlie Rose: You're adding to his net worth, are you?

Warren Buffett: Well --

Charlie Rose: -- or vice versa?

Warren Buffett: Yeah, yeah - I think, well, lately I've been adding to his.

Charlie Rose: But competition just in that way.

Bill Gates: Well, usually in bridge we play on the same team. It's only in golf --

Charlie Rose: Yeah.

Bill Gates: -- that we sometimes get to win or lose a dollar against each other.

Charlie Rose: Did he get you to play bridge?

Bill Gates: I had played growing up, but there's no doubt I'd sort of given it up. And my re-addiction and seriousness about bridge came because it was something Warren enjoyed doing. And I got drawn in.

Warren has friends that I got to know who are very good bridge players. And it's an incredible game.

Warren Buffett: Bill and I have worked on projects, or talked about working projects. I mean, (inaudible). Now, the problem with the game is, I was talking to Bill about this, you've got to play for or work at it for

30 hours maybe before you know what the game is all about. Now, from that point, you just - it's nothing but fun and --

Charlie Rose: But the learning curve --

Warren Buffett: Yeah, but the first, you don't learn it in an hour, two hours or three hours. So - so people really have to stick with it while they're kind of confused and get through that period.

Charlie Rose: Learn the language.

Warren Buffett: And a lot of people -- you see, when my daughter Susan and her then husband Alan, they took bridge lessons for a while, but they just didn't cross, they didn't get that far.

Charlie Rose: Yeah.

Warren Buffett: They didn't cross the line.

Charlie Rose: What have you learned from this young man?

Warren Buffett: All kinds of things, Charlie. I mean, obviously, in his own field I've learned things from him. But you learn from all your friends. And you learn good things. That's - that's the nice thing about friendships. So, it's -- you know, it's a continuous process.

Charlie Rose: You and I much have talked frequently about values --

Warren Buffett: Right.

Charlie Rose: -- some sense of how important it is.

Warren Buffett: Yeah.

Charlie Rose: You have to share values.

Warren Buffett: Right.

Charlie Rose: Otherwise there's no --

Warren Buffett: Yeah.

Charlie Rose: You know, sense of integrity or sense of -- but also a sense of - of the way -- he is --- are you the student in this relationship?

Warren Buffett: No, no.

Bill Gates: As much as I can be. Absolutely. I would say yes.

Charlie Rose: Because you once said to me, I study him.

Bill Gates: Well, I've learned an incredible amount from Warren. And some of them are things you can express, like, you know, really looking at the time on your calendar and valuing having as much free time as you can. I love it when Warren gets out his calendar book.

Charlie Rose: There's nothing in there.

Bill Gates: Empty days in there. And I think --

Warren Buffett: I put (inaudible), just to show that somebody knows I'm still alive.

Bill Gates: That is the way - the way to do things.

Warren Buffett: But Bill, I mean, I - I consider, for example, I consider Bill, it's not only the size of the Gates Foundation, but I consider it the best run philanthropy in the world that I know about. I mean, I really admire what he's done in the last-- and Melinda with him -- in the last five years. So, it's - you know, I'm learning from him all the time.

Charlie Rose: But in a sense of how he's approached philanthropy in the --

Warren Buffett: Just how he thinks.

Charlie Rose: But you'd probably talked to him about that too. Don't you?

Bill Gates: We've had a lot of fun talking about philanthropy. In fact, the idea that giving money to children could actually be a detriment to them. I hadn't started thinking about that. And then when I first met Warren and, you know, he said that - that was going to be his approach, that really convinced me, that made sense. Then of course, it created the issue of how to give it back in the best way.

Warren Buffett: His kids still like me, incidentally.

Bill Gates: Wait until they grow up.

Warren Buffett: Yeah

Bill Gates: Yeah.

Charlie Rose: Here is some ice cream. Don't worry about the (inaudible) --

Warren Buffett: Yeah, the fact that he just cut them out of the will --

Charlie Rose: There is no more. There's only a modicum amount coming.

Bill Gates: And my daughter refers to Warren as the man who works at Dairy Queen.

Charlie Rose: Don Keough refers to him -- his kids used to refer to him as the man who was upstairs playing with trains.

Warren Buffett: Playing with trains, yeah.

Charlie Rose: It's a strange life you've led.

Warren Buffett: I'm big with kids.

Charlie Rose: But the difference about philanthropy, which everybody talks about and everybody is admiring of the way you did it and - and how you came to it, what have you learned other than the way he's approached it and how he has organized to do it and Melinda, of course, together?

Warren Buffett: They're both incredibly rational in terms of thinking, you know, what -- what can produce the best results from society for society from this significant chunk of money? And so they - they set a framework first, and then they both become extremely smart about the best way to execute within that framework so as to get the best results. And - you know, they're both young. So the world is going to benefit enormously, you know, for decades. But I've seen a lot of people give away money and some of them -- and there's nothing wrong with any of the ways as far as I'm concerned -- but people generally aren't as thoughtful about it, in my opinion, as - as Bill and Melinda have been. And - and they get better at it all the time.

Charlie Rose: Is it also part for both of you, in a sense that if there is two people who have certain similarities in terms of wealth and then certain similarities in terms of IQ and intelligence, there is someone who you feel comfortable with that you can express ideas to and bounce things off, with respect?

Warren Buffett: Well, we're totally comfortable with each other. Yeah. You don't -- I mean, you don't have any worry about violation of confidence or misunderstandings or anything of that sort. So as it --

Charlie Rose: And someone who can grasp the idea that you think about.

Warren Buffett: Oh, yeah. Right. Right.

Bill Gates: That's right. When there's something that I don't get in business, it seems strange to me. I love to say to Warren, does this seem strange to you too? You know, why does it work this way? Why is - you know, this business like this and this other one like that? And it's so much fun to - to think about why that might be and explore it. And Warren will send me lots of articles, you know --

Charlie Rose: Rip - rip various things out -- You're reading something --

Warren Buffett: Yeah, I just write right on the publication, yeah.

Charlie Rose: And send it to Bill?

Warren Buffett: Yeah.

Bill Gates: It's the low-tech approach to email.

Warren Buffett: I don't send emails.

Charlie Rose: You know, I was going to ask that. Why don't you guys email each other?

Bill Gates: Well, I can email to his administrative assistant. And sometimes she'll - he'll have her email stuff to me. So --

Charlie Rose: But you don't put your hands on the keys.

Warren Buffett: It's all a mystery. I don't know what's going on out there.

Charlie Rose: It's not a mystery.

Bill Gates: That's part of his act.

Charlie Rose: He has said Bill can do everything I can do.

Warren Buffett: That's true.

Charlie Rose: But I can't do some things he can do.

Bill Gates: Oh, that's not true.

Warren Buffett: It is true.

Bill Gates: That's not true. Now, it is interesting how - how curious minds have a few things they're very good at in a special way. Like Warren looking at values and companies. And then -- but that - that intelligence can apply to a lot of interesting problems. And, so each - and have domains that we're very focused on our whole lives, which I think helps - helps you to be good at something. But then we're

interested in all the things about business and politics that our experience in our special areas give us some - some ability to think about those.

Charlie Rose: Has he led you to sort of investigate Ben Graham and try to understand what it is that is at the core of his fundamental outlook about investing?

Bill Gates: Definitely. Soon after I met Warren, I went back and read "The Intelligent Investor." I said, oh, this is about bond yields. I mean, this is pretty basic here.

Warren Buffett: That's why he doesn't go into competition with me.

Charlie Rose: It - it is also part of the lore of the two of you. You have never invested significantly in Microsoft.

Warren Buffett: After I met him, I bought 100 shares. No, it - it's - it's --

Charlie Rose: He's spent a day explaining his company to you.

Warren Buffett: Yeah, well, if I had -- if somebody told me I had to bet on anybody or any company in the business, that's the one I would have bet on. But it's just not a business or an industry where I think I can see 10 years out as to how the world --

Charlie Rose: Change is happening so fast.

Warren Buffett: Yeah.

Charlie Rose: And if change is part of a business, then you're a little bit --

Warren Buffett: Maybe I think I'm 60 percent sure of the answer or 65 percent sure, but when I can go some place else and think I'm 95 percent sure, that's where I'm going to go.

Bill Gates: And I've never, you know, said to Warren he should buy Microsoft. It does not fit his model. Technology is - is a sorting game. It makes it fun to be part of.

Charlie Rose: Yeah.

Bill Gates: And it means when you do get things right, the returns can be pretty phenomenal. But --

Charlie Rose: That means -- Phenomenal would be what the returns are.

Bill Gates: You know, the history of our business is where fantastic companies -- Wang, Digital Equipment --

Charlie Rose: Right.

Bill Gates: -- missed a turn in the road and off they went.

Charlie Rose: Right.

Bill Gates: You know, so we all study those things.

Charlie Rose: So, he's right then, I mean --

Bill Gates: Oh, absolutely he's right.

Charlie Rose: With technology, there is change, and with change there is risk.

Warren Buffett: Change is wonderful for the world, but sometimes it's not so wonderful for investors.

Charlie Rose: His friends have said to me, Carol Loomis and others, that what he understands better than anyone is price. Ben Graham understood that too. Cheap price.

Warren Buffett: Value.

Charlie Rose: Value is a better word.

Warren Buffett: But he did use --

Charlie Rose: Yeah. And you -- tell me some of the other things that -- about him that you haven't seen or you rarely see in a businessperson?

Bill Gates: Well, when there was a crisis at Salomon, Warren got called in over the weekend. And during that course of the weekend, he had to explain to regulators why they shouldn't shut the place down.

Charlie Rose: Why the shouldn't shut it down, yes.

Bill Gates: Because it would have created this financial crisis. He had to go in and pick a new CEO. And he had to deal with all the questions the press might ask about what had taken place there. No one else could have done that. You know, he picked a fantastic person to lead - lead the company. He got the regulators to understand the chain of events. And there were many different regulators, some of whom weren't that easy to get a hold of. You know, that's - that's just a unique thing. The world - it's very lucky that Warren had enough of a connection so that he could be called in to put out something that could have turned into a real problem.

Charlie Rose: And that's about judgment.

Bill Gates: Judgment of people. Judgment of values. Ability to communicate. It's part of the story is he gets someone on the phone and says, this is maybe one of the most important phone calls.

Warren Buffett: I said it's the most important day of my life.

Bill Gates: Yeah.

Warren Buffett: That call was with Nick Brady, who was then secretary of the treasury. And - and we had received this terribly adverse order from the Treasury, which would have put us out of business on a Sunday morning. The U.S. Treasury does not normally issue things on Sunday mornings. And Tokyo was going to open in the afternoon. And they were going to throw --

Charlie Rose: Yeah.

Warren Buffett: -- billions of dollars of liability at us. So, I spent that day trying to get that order at least modified. And - and the Treasury Department wouldn't tell me where Nick was, so I would call them but he had to call me back. And the phones didn't ring on Sunday, so there -- I had to stare at this damned phone to see whether a little green light would go on. But at one point I said to Nick, I said to Nick at one point, I've been trying to get through, you know, the problems we were going to have when Tokyo opened, which was at 6:00 in the afternoon. And I -- I made the statement, this is the - this is the most important day of my life. And Nick - and he knew me. And my voice was probably cracking and everything. And he knew that whether I was right or not, I believed I was right on that point. And he made a modification, which in effect allowed the firm to be saved.

Charlie Rose: Because he had confidence in you?

Warren Buffett: Well, he knew I wasn't --

Charlie Rose: Right, Bill? That's what it was.

Bill Gates: The integrity.

Charlie Rose: The whole sense of --

Bill Gates: Yeah.

Charlie Rose: Paul Murphy told me a story about you. This is amazing to me. When you invested in Cap Cities, you gave him, without telling him, voting rights.

Warren Buffett: Yeah, sure.

Charlie Rose: -- for the stock. Without telling him. I mean, this is a quality of a man.. You-- they don't come like this.

Warren Buffett: It's not -- Tom Murphy is the quality of man --

Charlie Rose: I know. But you had confidence in him.

Warren Buffett: Oh, absolutely.

Charlie Rose: But I'm just - the point of not telling tell him. I mean, you did it because it was the right thing to do, but -- I want to come back to another quality you believe strongly about, and I think Bill reflects that. It is this time management idea. I mean, you have - you try to tell people-- reflect on this -- the sense of how you -- this is a man with enormous IQ, you are a guy with enormous IQ. But there are a lot of people with big IQs who don't get as much accomplished, because of what? They're not?

Warren Buffett: They have a 500-horsepower motor, and they get a 100 horsepower out of it, you know, because they have all these things that are throwing sand in the gears. And it's - it's amazing how -- you see a lot of that on Wall Street. It's amazing how people, you know, can play three-dimensional chess and solve all kinds of tough problems get - get tied up in, you know, in sort of elementary aspects of behavior and all of that that are so self-destructive.

Charlie Rose: Beyond the business acumen, beyond the investment philosophy and execution, there is, it seems to me, and I just -- think about this, because you know him so well, better than anybody, or better than most -- that quality of someone who has formed a philosophy of life.

Bill Gates: Well, someone who loves life. I mean, a lot of people have a philosophy --

Charlie Rose: That's true. That's true.

Bill Gates: The thing that stunned me the most about after I met Warren -- of course, you know, that he was brilliant --

Charlie Rose: Right.

Bill Gates: -- and interesting but that he really was having fun.

Charlie Rose: Yeah.

Bill Gates: And that, you know, I - I know how to have fun, but not quite at that level.

Charlie Rose: So that's the thing that he gave to you, a sense of insight.

Bill Gates: Right. That if you pick the things where you can make a difference, if you pick your time the right way, you pick your friends the right way, you pick the things that you really can contribute to, that that can be so much fun. You know, I'm not as good at it as Warren. But that's one of the best lessons I've learned.

Charlie Rose: That sense of --

Bill Gates: That - that you can enjoy - enjoy these things.

Charlie Rose: Yeah.

Bill Gates: And it's --

Charlie Rose: But you - but you --

Warren Buffett: We're lucky, too, Charlie. You know, I mean - we're -- if we had been born in a different place or wired differently, I mean, if we - if we don't have fun, then something is wrong with us.

Charlie Rose: If the three of us don't have fun.

Warren Buffett: You're right. Exactly. Exactly.

Charlie Rose: Do each of you in a friendship that is so strong tell each other when you're wrong if you think you're wrong? Is it that kind of candor a part of this --

Warren Buffett: We wouldn't hesitate to do that.

Charlie Rose: If it was necessary. (inaudible).

Warren Buffett: Sure, sure.

Bill Gates: And anything that I'm troubled about, for example, when Microsoft was - was having some challenges in court, there were parts of that where just talking it through with Warren . . .

Warren Buffett: Yeah.

Bill Gates: -- you know, not that he would tell me necessarily to do something completely different, just to talk through, how should I think about it? You know, that was an incredible gift for me.

Charlie Rose: Did you buy your wedding engagement ring in Omaha, Nebraska?

Bill Gates: Absolutely.

Warren Buffett: Yeah.

Bill Gates: What happened was, Melinda and I were in California. And she thought we were flying to Seattle. And so when we started to land, I distracted her by saying that my schedule is really messed up, got her a little riled up about a schedule thing, so she wasn't noticing that we landed in Omaha.

Charlie Rose: She didn't look out the window.

Bill Gates: No - no. I had her - I had her distracted. So then when the jet landed Warren was there. And he took us over to Borsheims, and he had a little advice for us.

Warren Buffett: Yes.

Charlie Rose: What was the advice?

Warren Buffett: Well, I said, look, Bill, I said, this is none of my business, but - but I said, when - when I got married, you know, I spent 6 percent of my net worth on the ring. And I said, I don't know how much you love Melinda, you know --

Charlie Rose: But 6 percent is the place to start.

Warren Buffett: Well, let's quantify it.

Charlie Rose: And we have the ring just for you. You both -- you're at different stages in your life. You both can do anything you want to do, buy anything you wanted to. Life has been good in terms of family, in terms of --

Warren Buffett: Incredible.

Charlie Rose: The - the ovarian lottery has been good to both of you.

Warren Buffett: We - we won the lottery the day we were born.

Charlie Rose: Are you optimistic about America today?

Bill Gates: Absolutely. I'm optimistic about the entire world, and, you know, the United States as part of that. We won't on a relative basis be as unique as we had been, but our wealth will continue to go up. The medical breakthroughs, the computer breakthroughs that will let people pursue their curiosity. This is a great time to be alive. The improvements that will take place will be great for everyone.

Warren Buffett: Bill is an American, but he - he is basically a citizen of the world. I mean, he - he has a world view. He thinks that the child in India is as valuable as the child next door. And he lives it. And it comes out in how his foundation operates, and that . . .

Charlie Rose: Did you come to that because of - because of the obligation you put on yourself?

Bill Gates: Well --

Charlie Rose: In terms of giving away the money?

Bill Gates: The - when we thought about giving away the money, the issue of what is the greatest inequity in the world came up. You know, in our -- the United States has been great about thinking through gender equity, racial equity, you know, trying to reduce those things, but the idea that the greatest inequity was the lack of having health intervention that would let children live, it comes from a sense of - of trying to level things out and let these advances benefit the world broadly, 6 billion instead of just, say, one billion.

Charlie Rose: Anything else I should say about this friendship? I mean, it's so unique. And everybody is fascinated by it of what makes it up and how it's so satisfying for both of you?

Warren Buffett: Well, we're sort of the odd couple to the rest of the world, I'm sure. But nevertheless, it couldn't work better.

Charlie Rose: Warren Buffett made an historic gift of more than \$30 billion to the Bill and Melinda Gates Foundation.

Warren Buffett: By letters which were delivered earlier today, I've committed 12,050,000 shares that are earmarked, held by me. But every July, I will be giving a million shares to the Bill and Melinda Gates Foundation. Did I say 10 million? I meant to say 10 million. And a million shares to the Susan Thompson Buffett Foundation, and 350,000 shares each to the three foundations headed by my children, Susan,

Howard and Peter. And that will continue throughout my lifetime, subject only to one -- at least one of Bill and Melinda being active in their foundation.

Melinda Gates: Bill and I are absolutely honored and humbled by Warren's gifts. It's really unprecedented in terms of what we can do to do good in the world. And it's something that we take very seriously. We have -- feel an incredible responsibility. I think when you give away your own wealth it's one thing, but to give away the body of somebody else's life's work is really quite something.

Bill Gates: We've known Warren since 1991. And it was his thought that wealth should go back to society that got us thinking about doing our foundation the first place. And as that's grown, we've had a chance to share how that's worked out. I remember one time in 2001, where I got to give a talk to Warren and some of his friends about global health, and you know, how excited I was about the opportunity to do something there.

Charlie Rose: There is also this. A selfless act. I mean, didn't you have any great desire to see the Buffett Foundation and the Buffett Library and the Buffett this and Buffett that?

Warren Buffett: No. I like the Omaha Public Library.

Charlie Rose: What will be your role then? I mean, you'll be a trustee, but will you sort of what?

Warren Buffett: If I have any ideas, they can use me as a sounding board. They can use me any way they want to use me.

Charlie Rose: They're already doing that.

Warren Buffett: That's true. And so, there really -- it's not a big deal. But if I, you know, any time I can be helpful, fine. I won't get involved in their investments. That complicates life. So I'm just totally out of that game.

Charlie Rose: Are their priorities your priorities?

Warren Buffett: Overwhelmingly they mesh. Yes, or I wouldn't be doing it otherwise.

Charlie Rose: And you have the Susan Thompson Foundation looking at other issues and the kids' foundations, which are involved in a range of issues.

Warren Buffett: Sure. But I've seen what they're interested in. And I've seen the way they pour themselves into it.

Charlie Rose: Will you be able to do things that you couldn't before?

Bill Gates: Absolutely. In some ways, we have the challenge of success. That is, every time we get a new drug, then you have a much bigger problem of how do you get it distributed? How do you make sure it has the impact you have in mind? If you look at the top 20 diseases, there's at least 10 of those we're making very good progress and can expect in the next five to 10 years to have solutions. And so scaling-up is very important. In education, as you get one high school that's working well that's a model, you'd like to see that spread throughout the country. And so what we've got here is the opportunity now to really deepen and accelerate. We'll add some things that relate to poverty, but the top goal being going after the health and poverty issues, and then education is the second. That's not going to change.

Charlie Rose: You have found that, in fact, if you can change health, it will have an impact on how many children people have. It will have an impact on a whole range of other things beyond their health.

Melinda Gates: Absolutely. And I think what this allows us to do is deepen what we do in health. So we're already working on medicines for malaria or tuberculosis vaccine or an AIDS vaccine, we can also start to surround those program. You can't give somebody medicine if they don't have any food in their belly to eat, or if they don't have clean water. And so looking at some issues around, say, agriculture to help small farmers in Africa, give them drought resistant seeds for sorghum or help them get seeds that if there's a virus in their banana, doesn't spread from crop year to year, help them get their products to market and have more information. Helping them figure out ways that they can have clean water or healthy food to lift their family up, while we're also starting to solve some of these diseases I think is how we'll deepen the impact of what we're doing in health.

Charlie Rose: Is there and has there been any kind of dilemma between spending money in terms of the future, as you did with the grand challenge, and spending money today in terms of the logistics of getting existing drugs to people?

Bill Gates: Absolutely. I mean, we have finite resources, and there's a very healthy dialogue that goes on, where some say, hey, you ought to spend more on the immediate solutions, and others saying, no, you're kind of unique in being willing to fund the research, and so you should focus more on that. And that's great. Having that ongoing dialogue, people who disagree with this, getting the advisors to come in on those issues is very helpful. You know, take AIDS as an example. Spending money on prevention has this incredible impact, because every case you prevent prevents the cases that might have caused. But then you see the face of the tragedy, the people who are getting ill, and you want to have treatment getting to them as well. And so there's -- these problems are big problems that can absorb huge amounts of money. And in fact, that's why we need to work with governments and make sure they get involved. We've been very pleased to see many governments around the world step up and do more in this area of global health.

Charlie Rose: Was it important to you to be able to make this philanthropic gift and have it pay off immediately?

Warren Buffett: Well, you certainly want it to be used intelligently immediately. The pay-offs don't necessarily come that fast. And frankly, that's why they'll be a lot better at this than I am. I like immediate feedback. I'm the kind of guy, if I walk in the ice cream store, I want a triple dipper right there.

Charlie Rose: You don't want to (inaudible), yes.

Warren Buffett: And really, you have to have a longer view than that. You have to take delayed results in many cases. Now, they're going to be impatient to get the best results they can, but it's a different game in that respect. And they're very well suited for it.

Charlie Rose: You weren't convinced you'd be good at philanthropy, were you?

Warren Buffett: I think I'd be terrible at it.

Charlie Rose: Why? Other than the fact that --

Warren Buffett: I like the fast feedback, but secondly, it probably requires answering to a bigger constituency in a sense than I like doing. I like to look in the mirror and ask myself is what I'm doing OK? And there are a lot of people whose opinions I really don't want to listen to. So you have to be a little bit more diplomatic perhaps than I am. And I'm just delighted. Charlie, you know, as I said in that article, I mean, if you have got something important in life to do, let's say I was going to play the golf match of my life and I can get somebody to substitute for me like Tiger Woods, I would do it. And if I had to sing on television, you know, and I could just mouth the words and get Sinatra in the background doing it for me,

I'd do it. So the idea that you have to -- you have various responsibilities in this world, and this money is a responsibility. But if you can get somebody better at doing something that needs to be done in your place, you know, that's -- I'm used to that.

Charlie Rose: People have been speculating, as you know, for a long time about why you haven't done this before. And you were saying you haven't done it before -- Suzy's death was one thing.

Warren Buffett: No, but if you go all the way back, Charlie -- I mean, Suzy and I decided when we were in our 20s that the money would go back to society.

Charlie Rose: When you told her you were going to be rich. One thing you could be sure of.

Warren Buffett: I was sure of it. She thought I was delusional. But as time went along, I managed to convince her. But you know, it was always going to society. There wasn't any question about that. Now, my logic -- but it also went down the grade of what I wanted to do -- but my logic was that philanthropic needs would be huge today, tomorrow, 20 years from now, 100 years from now. And if people were going to devote their money to philanthropy, the ones who were high compounders should take care of the philanthropy 20 or 40 years out.

Charlie Rose: That would be you.

Warren Buffett: Yeah, I really thought I, you know, it made way more sense than to give \$1 million 30 years ago, which might have been all I would have had available, to have it compound. And people who were low compounders should take care of the current needs. I mean, if I ran a university and I had two wealthy alumni and they were going to supply all the money, I would take the guy who wasn't going to do much with the money and use his money currently, and I would have the other fellow compound for me. So anyway, it was a convenient way to think anyway. And you know, that has been my philosophy on it. But now is the time.

Charlie Rose: Do you think people are surprised you did this?

Warren Buffett: Probably. Yes.

Charlie Rose: When you made this decision, you had to ask yourself will there be consequences for this extraordinarily compounding that has been taking place? And will it affect Berkshire Hathaway stockholders?

Warren Buffett: Yeah. And I don't think it will one iota. As a matter of fact, 31 percent of the money that Berkshire Hathaway makes, if we can make another \$100 million, 31 percent of it through my shares is going to philanthropy. So if there's any -- if you could have a greater motivation than I've had over the years -- I'm not sure you could -- but I would have it now. I mean, it's a great feeling to know that as the company becomes worth more and more money, that it actually translates into something good for people around the world.

Charlie Rose: So I know of no one who loves his work more than this guy does. He loves to tap dance to work, as he says. That will continue.

Warren Buffett: Yeah.

Charlie Rose: You'll go back to Omaha and tap dance to work and make these decisions, now knowing that you're not only benefiting the Berkshire shareholders, but also people's lives far away.

Warren Buffett: I knew it would benefit philanthropy eventually, but now it's very tangible. It's very tangible. And every year, I hope those shares that are committed to go that year are worth more money. And over time, you know, I think they will be. So this can be a lot bigger. And it's up to me to work to make it so.

Charlie Rose: But you do grow a great satisfaction from the fact that you have now made this decision and you know where it's going.

Warren Buffett: Absolutely, Charlie. I mean, it's the second act of the money, basically. You amass these claim checks in effect, which money is on society. And then you figure out the best use for them.

Bill Gates: The philosophy that Carnegie had in "The Gospel of Wealth." Warren handed that out at a get-together we had. And, you know, it really helped me think about philanthropy and how you ought to set very high goals.

Charlie Rose: This is before you created the foundation?

Bill Gates: That's right. The whole idea -- The whole idea of not, that leaving the wealth to your children might actually not be the best idea for society or for them, that came out of some things that Warren was talking about right around the time we met him. I was starting to think, oh, gees, this is a problem I'll have to deal with. Here is some very good advice about that. And now, here we are. But I do think energy and pulling people together the right way, getting partners to work together in new ways, it's what's allowed us to move as fast as we have.

Warren Buffett: Charlie, I've, you know, in business I've had a great partnership with my partner, Charlie Munger. And I've seen what happens when you get two people together that, you know, that are totally in sync but also have different ways of looking at things, but are working toward a common goal. And you could not have a better pair than Bill and Melinda running a foundation.

Charlie Rose: I wonder, do you think you'll be drawn into this and so his involvement will deepen?

Bill Gates: A little bit. I think Warren would be an incredible philanthropist, but he loves his job and that's what he's going to do full time.

Charlie Rose: But you love your job and you have misgivings about leaving Microsoft.

Bill Gates: No, I do. This is a tough one. It's unusual to have two things that you love and that you think are important and challenging. And so I've had this debate for several years. And I wanted to be very explicit about the change, and I don't even know what it will be like, but I'm very excited about it. And this just reinforces the importance of having that time and spending it well. But we had Warren at a discussion about microfinance about a month ago. And you know, it was great talking with these bankers. You know, Warren was asking about their costs and did people repay the loans. And so we're going to draw him in a little bit. We'll do our best.

Charlie Rose: I'll bet. You said it famously about children, your own children, who you've done wonderful things and created foundations for them.

Warren Buffett: I'm very proud of them.

Charlie Rose: Exactly. You're very proud of them. And they feel the same way about you. That you wanted to leave them enough money so they could do whatever they wanted to do, but not do nothing.

Warren Buffett: Yes, they can do anything but not nothing. I don't believe in dynastic wealth. I mean, if you contrast -- it's nice to leave something to the kids. I can understand a person who wants to leave their farm or a small business they built and all of that to their children. But dynastic wealth, the idea that many generations should be able to go without doing a thing if they wish, simply because they came from the right womb, I mean, that really strikes me as flying in the face of what this country is about. I mean, we believe in a meritocracy and equality of opportunity, and dynastic wealth flies in the face of that. So I really felt that if you have a choice between having a foundation like this doing tremendous things for people all over the world or having a bunch of people, you know, as they say, that came from the lucky sperm club.

Charlie Rose: The ovarian lottery. Now, you've mentioned Charlie Munger.

Warren Buffett: Yeah.

Charlie Rose: You called him up and said I'm thinking about doing this. What was his reaction?

Warren Buffett: He said, you finally have a good idea. I've been waiting for that for years.

Charlie Rose: Did he really?

Warren Buffett: More or less, yeah. Bill and I sort of have a background mind-set of a market system. And a market system works awfully well. It's worked well in this country, but a market system has not worked in terms of people, poor people around the world with a disease that should be available for just peanuts.

Charlie Rose: It doesn't work because the people cannot afford to participate.

Warren Buffett: The market system just fails in that case. And you have to interject yourself into that, and make sure there is a system that will deliver. I'm a big believer in the market system 95 percent of the time. But the -- it's done pretty well for me.

Charlie Rose: And the world.

Warren Buffett: And the world. Absolutely. But there are things where the market system is not going to solve the problem. That's where Bill came in on this.

Charlie Rose: You have said to me in other conversations, you know, when you were thinking about what foundation you might be involved in, not in terms of choosing one but in terms of what your money might -- that you wanted to choose things that have perhaps been neglected.

Warren Buffett: If the money is pouring into something and talent, you know, there's really no reason to duplicate. There's millions of good things to do in the world. And you're looking for something that's important. You're looking for something that you'll be reasonably good at in terms of implementing any ideas that do come to mind, and you're looking for something that really needs more funding. And that's exactly the way that Bill and Melinda have come at the problem.

Charlie Rose: You know who Bill and Melinda can certainly speak to this, who would love this is Suzy. I mean, the idea of what you have done.

Warren Buffett: Yes.

Charlie Rose: Because she said to me, you know, I mean, I'm always wanting him to do more.

Warren Buffett: You know, I was out -- I was not holding her back, we'll put it that way.

Charlie Rose: Holding her back from speaking her mind or giving away --.

Warren Buffett: No, her -- no one could have had better instincts about doing it. And she would have liked to have started much sooner, and as soon as it could be done on a good scale. And I wouldn't quarrel with that. She saw people one at a time. And she saw them with needs now. And she was hit by that, obviously. So I mean, I don't disagree with that. It was perfectly natural for her to react that way. And if she -- if I died when I was 60 or something, there would have been a lot of money then, I mean, she would have really gone to town with it.

Charlie Rose: And you would have been pleased that she would be running a foundation dedicated to that.

Warren Buffett: Absolutely.

Melinda Gate: And she cared a lot about these issues. I mean, she talked enormously about women lifting themselves up in their situation, and particularly having access and tools to family planning was something she was very interested in. And she traveled extensively, especially to Vietnam and a lot of places in Southeast Asia. So she cared a lot about these inequities. And I keep thinking how pleased she would be that Warren made this decision.

Charlie Rose: You hope in what way this will in a sense spur other wealthy people?

Warren Buffett: When people are thinking about amassing wealth, they frequently go to somebody else that they think knows more about it than they do, and join in. I mean, 50 years ago -- 50 years ago last month, I started a partnership, and seven people gave me \$105,000. Now, why did they do it? They thought I would be better at accumulating money for them than they could themselves.

Charlie Rose: Good bet.

Warren Buffett: Well, it has worked out OK. But why not apply that same thinking when you're eventually dispersing wealth? I mean, the idea that your old business cronies or some local pals at the country club or whomever, or even a professional staff that may take over the agenda, the idea that you can't also apply that same theory of getting people that are better than you are at doing something in dispersing wealth as well as in amassing wealth, I think it's sort of obvious. So I would hope that people even of modest means, that don't have something specific that they really want to do -- and if they have something specific, God bless them. I mean, if they have their alma mater or whatever. But if they really are sort of groping for what to do with far more money maybe than they ever anticipated that they would have, they can look around. It doesn't have to be the Gates Foundation at all, but they should look around for somebody that they think will do the job better than they can do it themselves, that has somewhat similar goals, and turn the money over to them. I think it makes nothing but sense.

Bill Gates: When we described to a friend what Warren was doing, we were saying, wow, this is an amazing thing that the two of you met and that this could come together. And they acted like it was almost obvious that this would happen. I have to say to me, it wasn't. I mean, when Warren first mentioned it, it was like, wow, is he serious about that? Wow, are we ready for that? And you know, it's only hitting me today. I mean, this is the day Warren is going to actually sign these letters.

Charlie Rose: But how long ago was that, Bill? Do you remember? When he first mentioned it to you?

Bill Gates: Over the last year-and-a-half or so, he mentioned in. And at first, it was just kind of in passing, just a very nice thing, that gosh, your foundation is doing well. And we had had that ongoing dialogue. It was in the last few months that it was clear he was getting very serious. And with Warren, once he decides something, it's very crisp.

Charlie Rose: The other thing I know about you, once you make a decision, you don't look back. You have not lost one moment of sleep because I might be doing the wrong thing, maybe, maybe, maybe, nothing?

Warren Buffett: Nothing.

Charlie Rose: Do you wish you had done this earlier?

Warren Buffett: No, I really don't. I think this is the right time.

Charlie Rose: This is the right time to do it?

Warren Buffett: Yes, I do, Charlie. I've had a good chance to see what they've done. I feel Berkshire's position better than ever for the future. One thing about it, if I had given the stock in a lump amount, there might be people that say they were too concentrated in one stock and that sort of thing. Well, I want the well-being of their foundation to be sort of concentrated in Berkshire, because I think it's going to do very well. So I wouldn't want them to be forced to sell it and buy government bonds or something of the sort. So this way, I think -- I don't see how it could be any better.

Charlie Rose: How will this change your life day to day?

Warren Buffett: Zero.

Charlie Rose: Zero. You go back to Omaha, and you tap dance to work. Get on the phone -- Bill once said to me, you do three things. You talk on the phone. You read. You play bridge. And then watching the cable television shows you like.

Warren Buffett: What else is there in life, Charlie?

Charlie Rose: Well, I'll tell you what else there is in life. There is the satisfaction to know and to see that you can while you're alive -- not when you're dead and not among executors -- that you can do something that you can see because it's already taking place. Changing lives, saving lives.

Warren Buffett: And see it getting done right, which is really sort of --

Charlie Rose: Make accommodations, yeah. This is a great day for you.

Warren Buffett: It's a great day.

Charlie Rose: It really is. When you think about this gift and the reaction to it, which has been overwhelming, tell me how --.

Warren Buffett: Well, I've been surprised at the reaction, Charlie, because what else could you do in my position that made as much sense? I mean, it isn't like this required any brilliance or anything. It was just the logical thing to do to get a great, I hope --

Charlie Rose: But I think that's an interesting point. Because a lot of people say it is only because of Warren that you would come to that kind of conclusion. No other foundations are giving their money to the Bill and Melinda Gates Foundation.

Warren Buffett: Well, they haven't yet. And it shouldn't necessarily be them. But the idea of getting somebody that's better than you are, younger than you are, spent more time at it, is going to spend more time and who has common ends to actually handle your money for you, people do it all the time on the accumulation side. Why not do it on the distribution side?

Charlie Rose: You said to me in another conversation -- and help me understand this -- you would give up -- the future was so exciting, you would give up a year or two or whatever, if you could know what was going to happen the next 40 years.

Warren Buffett: If I could be an observer. I would give up being a participant for a few years at the end to be an observer for 40 years.

Charlie Rose: Sit there and be --

Warren Buffett: I find the world so interesting. And there's so many things I want to see -- I'd like to see how they come out and how they play out and everything. Those last two years, I'm probably not going to be much of a participant anyway, but I would give up a few years as a participant to be able to sit in the stands for 40 years or 50 years and see how this game plays out.

Charlie Rose: Just the convergence of all the forces everywhere in the world --

Warren Buffett: Oh, everything. Everything going on.

Charlie Rose: And the extraordinarily technological advances.

Warren Buffett: The world -- it's going to change so much, Charlie. It may not be for the better, unfortunately. But I still would like to -- I'd like to see the rest of the movie or a good portion of it.

Charlie Rose: We conclude this three-part look at Warren Buffett with this observation. Here is a man of great passion for his work, of great love for his friends, and who will see his life's work have a tremendous impact on the lives of others. Thank you for joining us.

Warren Buffett (2007)

5/10/2007

Charlie Rose: Buffett for the hour, next. Warren Buffett is here. He is the chairman & CEO of Berkshire Hathaway. It is a very successful company. It just had one of its most successful years ever. Warren Buffett has been CEO for 42 years. He has become perhaps the most admired investor in the world. We first began a series of conversations in 2004, and they have continued since then, as we have talked about his company, his life, his extraordinary gift to the Bill and Melinda Gates Foundation, and how he sees the world. I'm pleased to have him here for a continuation of that conversation. Thank you for coming to this table again. We began these conversations in 2004, and then 2005 and 2006, and now 2007. I hope they will continue for a long time.

Warren Buffett: I hope they will too, Charlie.

Charlie Rose: This has been a remarkable year since the last time we talked. The largest philanthropic contribution, which we talked about, in August, in the history. Too, you have had -- you've been married to a wonderful companion, Astrid Menks. Three, you have had the most extraordinary year in 2006. But most importantly, you are doing and continue to do what you love most, which is running Berkshire.

Warren Buffett: That's the ultimate luxury in life. I mean, if you get paid for doing something that you are paid to do, and have the time of your life, surrounded by people you love, doing every day what you love doing, I mean, it doesn't get any better than that.

Charlie Rose: 2006 was a great year.

Warren Buffett: It was a good year, yes.

Charlie Rose: Tell me about it.

Warren Buffett: Well, just, you know, we made some good acquisitions. Our managers all came through for us. And nothing went wrong. I think that's the best way to put it.

Charlie Rose: But this is the largest growth, 2006, for you, for Berkshire Hathaway, the largest growth in net worth of any company in the history of American business, except for Exxon, which pays mostly dividends, and some people who grew by acquisition.

Warren Buffett: Yes, and there are other people who earn more money, but they pay it out. But in terms of the actual gain in dollar net worth, I think we set the record last year.

Charlie Rose: People will pay a lot of money to have lunch with you.

Warren Buffett: If I don't sell it too often.

Charlie Rose: That's right. There's supply and demand.

Warren Buffett: Yes, supply and demand.

Charlie Rose: So what is it -- what is the most expensive lunch that you have been to?

Warren Buffett: Well, I am going to leave here and go to a lunch that a fellow has paid \$610,000 for. And Samantha Wolinsky (ph) has paid another \$10,000 to give us the lunch, so the charity will get \$620,000. This fellow will -- he's Chinese-American, he has become an American citizen, and he is bringing, in this

case, seven other people with him as well as his wife, his very talented wife. And we'll talk about whatever is on their mind. But I have enjoyed every one of these lunches so far.

Charlie Rose: How many have you done, 20, 25?

Warren Buffett: I guess about 10 maybe or something like that. And -- but since we went on eBay, the prices have really, really escalated, in terms of what it brings. This fellow is an interesting fellow, because he didn't want to bid earlier because he didn't feel his English was good enough. But this past year, he felt good enough, so he bid \$610,000. And he gave eBay a limit of 650,000, and he was going to keep topping anybody until the last second. But I have learned -- I have met some very interesting people in the process of doing this. So I get a lot out of it myself.

Charlie Rose: And I bet you they don't ask you, because you wouldn't tell them, specific stocks, what do I invest in.

Warren Buffett: No.

Charlie Rose: It is much more about tell me -- share with me some sense of what the kids are interested in.

Warren Buffett: Well, yes, and I met with one young couple where the guy's successful, very successful investment manager. He didn't need to know how to make money, but he wants to talk about raising his kids. And because he's going to have -- he has a lot of money, and it's a lot of questions. And whatever they want to talk about is fine with me. And the lunches have lasted as long as three hours, you know. I am there for as long as they want.

Charlie Rose: As you have gotten bigger, what are the risks of being big and what are the downsides of being big, and what are the upsides of being big?

Warren Buffett: Well, size is the anchor to performance. You can't run 100 billion or 200 billion the way you can run 100 million or \$1 million. So it is an anchor to performance. When I was running a few hundred thousand dollars, the whole world was my universe. Any idea, thousands and thousands of companies, any single one of them that was a good idea would have an impact on our net worth. Now, that universe has just kept shrinking, because if we do something brilliant with \$100 million and we make \$100 million on it, after taxes that is 65 million, and in relation to 160 billion, it doesn't move the needle. So I have to look at a very large companies, and that means that relatively few companies. That means that all kinds of things that would make sense for me to do, if I was running \$1 million or \$10 million, no longer makes sense.

Charlie Rose: The priority is acquisition rather than equity position?

Warren Buffett: Absolutely. I hope -- we have 73 businesses now. And they go all the way from Dairy Queen and the deli bars, you know, to 737s at NetJet. So we've got a little bit of everything. But I want more of everything. I would -- you know, I hope that 73 becomes a much bigger number. I like buying stocks too, and it is a game I know to some degree. But the real goal at Berkshire is just keep building more and more earning power from operating businesses with terrific managers doing -- that means I don't have to do a damn thing. I just sit there in the office and, you know, play my ukulele or whatever.

Charlie Rose: There is more than that.

Warren Buffett: Well, but it is -- the truth is, if you get a good business, you know, it's the gift that keeps giving. I mean, it gets better over the years. And instead of going from flower to flower, like you do more

in the stock market, you can -- if our 73 businesses we have now are very likely to be earning appreciably more money just by themselves 10 years from now, on top of that we will add more. And that's -- I love doing it, I love the managers that we associate with. And it's a lot of fun.

Charlie Rose: You are making investments in some companies you were in and out of, Wal-Mart being one.

Warren Buffett: Yes. Well, every now and then -- I mean, we sell stocks periodically. But the big mistake I made, actually, was I started out to buy Wal-Mart stock in the mid-'90s. And I was going to buy a significant amount of it. And we would have made probably \$8 or \$9 billion out of that. And instead, it went up a little bit and I started sucking my thumb. And I turned a potentially huge profit into a tiny profit. But that's one of the things -- That's one of the things we don't talk about.

Charlie Rose: A \$10 billion mistake.

Warren Buffett: A \$10 billion mistake, but --

Charlie Rose: But you are back in Wal-Mart --

Warren Buffett: Well, we have a small --

Charlie Rose: According to --

Warren Buffett: -- relatively small position in Wal-Mart, but we do have a position.

Charlie Rose: There was a story, I think, in "The Wall Street Journal" or somewhere, that there is some huge acquisition that you are thinking about. Now, obviously you are not going to tell me what it is. Is that a true story?

Warren Buffett: Well, it's true, but there are always long shots. I mean, there are some companies that would love to come with Berkshire. They just can't make it work, in terms of having something that would work in the market and be sensible for Berkshire shareholders. We have a lot of people that would like to join us. But prices are such, competition for buying business is such, that the chances of pulling any one of them off is, is -- is slim. But if you keep, you know, if you keep trying to kiss enough girls, eventually one says yes.

Charlie Rose: In terms of the resources you have, your capacity to pay is not an issue.

Warren Buffett: No. Everybody knows our check will clear. We can do big deals. We never stick in -- we've never made a contract where it says "subject to financing." I mean, we're financed. And so when somebody -- if I shake somebody's hand, they have a deal.

Charlie Rose: How many e-mails do you get a week from people who say, Mr. Buffett, I want to sell you my business?

Warren Buffett: We don't get very many, Charlie, because in the annual report, I lay out our criteria. And one of the criteria is a company that earns \$75 million pre-tax, or greater, annually. So I try to filter -- I tell people, you know, we are looking, you know, we're looking for St. ernard's and not Chihuahuas. And even though I say that, I hear about a few Chihuahuas. I mean, people can't resist the temptation to say, but I've really got this wonderful little business -- and they may have. But I just can't -- I can't focus on that. So by setting out the criteria clearly, it reduces the flow.

Charlie Rose: You lov newspapers.

Warren Buffett: I love newspapers.

Charlie Rose: You love the people who run The Buffalo News.

Warren Buffett: If I couldn't do what I'm doing, I would like to be in the news business.

Charlie Rose: You have said that unless it becomes an impossible cash drain, we know that this business will never be as good as it was, but we'll keep it.

Warren Buffett: That's right. Yes, there is only -- I put in the back of the annual report that only the two conditions under which we will sell a business. Either that it's going to be an unending cash drain, or that we have impossible labor problem someplace. But absent those two conditions, even though we see a diminished future for a business, or even though somebody offers us twice what one of our decent businesses is worth, we have no interest. I mean, we -- you know, it's --

Charlie Rose: When you buy them --

Warren Buffett: It's a lifetime.

Charlie Rose: -- you hold them.

Warren Buffett: It's a lifetime deal. That isn't what they teach you in business school. I mean, in business school, they say if somebody offers you 3x for a business that is worth x, that you take it. And they talk about portfolios of business. They're not portfolios of business.

Charlie Rose: Exactly. They are businesses you own and you treat them as an owner.

Warren Buffett: People join me, they trusted us to put something they have spent a lifetime building, and they wanted to find a final good home. And we're not going to change that around just because somebody offers a little more money for it.

Charlie Rose: Very different from some of the private equity firms.

Warren Buffett: Yes, well, they're in a different business than we are.

Charlie Rose: They are buying assets and (inaudible) assets and selling assets.

Warren Buffett: They have what they call an exit strategy. We have an entrance strategy; we don't have an exit strategy.

Charlie Rose: What do you think, of all the talk today, one, Sam Zell wanted to own the Tribune Company.

Warren Buffett: Right.

Charlie Rose: He paid a lot of money, sold to Blackstone.

Warren Buffett: Yes, and he crafted a very intelligent deal from his standpoint. How the Tribune turns out is another thing. But you couldn't have the deal set up much better from both a tax standpoint and from a relatively small investment, and leveraging it into something big. But you still have the Tribune Company to run.

Charlie Rose: And it is a declining business, as we know.

Warren Buffett: It's a tough business.

Charlie Rose: And as you say, people buy newspapers for importance. It makes them important if you own a newspaper.

Warren Buffett: If you own the "Omaha World Herald," where I live, or you own "The Fremont Tribune" in Fremont, Nebraska, you are automatically a very important, maybe the most important person in town. I mean, you -- you -- you have instant significance, prominence and everything that mere money might not have given you. It's like a sports team squared. You know, if you own the Yankees, you are going to be very important in New York City.

Charlie Rose: Yes, you are.

Warren Buffett: But if you own "The New York Times," you would be even more important.

Charlie Rose: Or "The Wall Street Journal."

Warren Buffett: "The Wall Street Journal" is the second most important property in the world, in terms of the significance it gives its owner.

Charlie Rose: First is "The New York Times."

Warren Buffett: Yes.

Charlie Rose: What do you think of this effort by Rupert to buy The Wall Street Journal?

Warren Buffett: Well, I think, you know, it doesn't surprise me at all.

Charlie Rose: Because he loves newspapers?

Warren Buffett: He loves newspapers. Plus, "The Wall Street Journal" and "The New York Times" may have a somewhat different future in an Internet age than the typical metropolitan daily.

Charlie Rose: Because of brand name.

Warren Buffett: And the fact they are national. I mean, their city, if you take -- Barney Kilgore came up with this wonderful concept many years ago, and I think "The Journal" had a circulation of 20 some thousand at the time --

Charlie Rose: He was the editor or --

Warren Buffett: Yes. And he had this idea, every other newspaper defined itself by town. I mean, if you were the Omaha paper, you served Omaha. A Philadelphia paper served Philadelphia. He conceived of a city that was not defined by geography, but was defined by interest. So he created a new city. And it was national, you know, in terms of where the location was, but it was a city with common interest. And he built "The Wall Street Journal" to serve that city. And it was a wonderful city, great demographics, all kinds of things. It was a brilliant, brilliant idea, well executed. And therefore, you have with "The Journal" -- and you have with "The New York Times" now too -- you have a paper that transcends any given geographical area, and that may work in some way on the Internet a lot better than trying to do it with the paper in Omaha or Buffalo or Philadelphia or Miami, or something of the sort.

Charlie Rose: "Washington Post," which you are on the board, has not done that.

Warren Buffett: Well, "The Washington Post" has done it -- "Washington Post" is still basically a local paper. I mean, they are overwhelmingly in circulation there. But their Web site has gotten real reach beyond Washington. The question is whether you can charge for it, you know, whether you can make the

economics good. And the problem -- the reason you can make a lot of money with "The Omaha World Herald" is that there is no competitor. And automatically, you make less money with it today and you'll probably make less money in the future, because there's new forms of competition. But in terms of direct competition, there's no direct competitor. If you were on the Internet, you know, I can click from "L.A. Times," "New York Times," "The Wall Street Journal," "Buffalo News," Omaha -- I can go all over, and there is no effort involved in my part. I don't want to go out on my doorstep and collect eight papers, you know, from around the world and sort them all out.

Charlie Rose: You are probably the only guy that does it -- Another one, me.

Warren Buffett: But it's -- what gave newspapers their marvelous economics is that they were national monopolies in most situations. And that monopoly power is decreased. And of course, the technology is just galloping along. There are a whole generation of people that don't really feel any great need to read the newspaper daily, but would have been total addicts back when I was growing up.

Charlie Rose: If you were the Bancroft family, would you sell?

Warren Buffett: That's decision they've got to make. It's an interesting thing, because, in a sense, almost every business is just basically a brick business or, you know, whatever business -- lemonade stand. The value of the business is the cash it is going to produce in the future. Now, when you get to sports teams, movie studios and particularly something like newspapers, it's the value of the cash that it is going to produce, plus the significance that comes with it. So it is an A plus B. B is big at "The Journal." In a sense, the Bancroft family doesn't really get the significance. They may get an inner significance, but everybody knows who George Steinbrenner is if he owns the Yankees. They don't really know the members of the Bancroft family. So they have an asset that is worth a lot of money to somebody else, not just Rupert Murdoch but other people, this B factor of significance, power -- call it whatever you want. And they can sell it, but they don't really get the value of it themselves. But they've got the tradition of it. It was handed down to them by parents or grandparents. They do believe that it is very important -- it is a very important national asset. And therefore, it is not something that should simply be sold based on whether they get x or x plus \$2 or something. But there is 35 members or something like that of the family. And you get 35 people in a room, and they're not going to all agree.

Charlie Rose: Some will peel off.

Warren Buffett: Well, a few have peeled off. The question is whether more peel off. And we don't know the answer to that yet.

Charlie Rose: If you were a betting man, would you bet against Rupert Murdoch?

Warren Buffett: Well, nobody has made a lot of money betting against him so far.

Charlie Rose: He has made a lot of money betting for himself.

Warren Buffett: No, I mean, he is -- he is a very -- he is a very smart man to start with, and he knows media, you know, as well as virtually anybody in the world. And I met him back in I think 1974, came up to Kay Graham's apartment, just after he bought "The New York Post." And he hadn't been over here very long. And he talked about both the business side and the editorial side of both newspapers and television. I don't know whether he had been in the country six months, but he knew that better than virtually anybody I knew in the business. And he knew both sides of the game. He was a publisher and an editor, or an owner and an editor. And he just -- it's his game.

Charlie Rose: Have you for a moment, for a moment, because \$5 billion is not a whole much in the broad --

Warren Buffett: Our check would clear.

Charlie Rose: Have you thought about it for a moment?

Warren Buffett: There is -- yes, I would say that. I mean, it -- you know, if a girl walks down the street, you think about it for a moment, Charlie.

Charlie Rose: More than a moment.

Warren Buffett: I thought you would say that.

Charlie Rose: You think so, would you? What did Churchill say, just because I'm looking at the menu doesn't mean I am going to have the meal.

Warren Buffett: But no, but I would say this. I would say a very significant number of people throughout the world, not just the United States -- mostly the United States -- who have significant amounts of money would think about it. I don't think it is at all impossible that other people emerge in this situation. I'm not predicting it, but you can't help -- it doesn't come along that often. If the New York Yankees came up for sale, you know, would there be more than one person to think about it? Sure. I mean, and they would think about -- groups would think about forming, all kinds of things. But there are certain -- there are certain -- it's like a rare painting coming up to a bunch of art collectors, except you can cube that in terms of this. Because this is not, you know, there's lots of famous paintings, but "The New York Times" and "The Wall Street Journal" are two properties that won't be created in the future.

Charlie Rose: Sounds like you are still thinking about it.

Warren Buffett: Well, I always -- it's a spectator sport if nothing else.

Charlie Rose: I'm going to let you off with that. But it sounds to me like this is a famous and beautiful painting that you like. And it's in the world that you live in, finance.

Warren Buffett: Yes, sure.

Charlie Rose: And the financial newspapers have been, and financial service companies, those that provide information in finance, have been the most successful.

Warren Buffett: Well, looking back, of course, it's really interesting. I mean, if you go back 35 years, no - - virtually no area was going to explode like financial information. I mean, the degree of interest in financial information now compared to 30 years ago has increased at far greater rate than sports, or, you know, political, anything. I mean, it has just exploded. And it is something you can charge for. Dow Jones owned that world back in 1970. I mean, they owned the world. And not just "The Journal," but even the Dow Jones news ticker. I walked into Walter Annenberg's house in 1977, and he had the Dow Jones news ticker. That was how you got financial news. And here we are, you know, and Rupert is talking about \$5 billion for that, you know. Bloomberg is worth \$20 billion or more. You know, starting from scratch many years later. It was one of -- it was a superb franchise in a fantastic field, and frankly, you know, they blew it, you know, in terms of -- they didn't blow it in terms of "The Wall Street Journal" not being important or anything --

Charlie Rose: Or a good paper.

Warren Buffett: No, no, not at all. But in terms of -- in terms -- as a business, having the audience, the franchise, everything they commanded, they owned the field. And they let other people take it away from them. And they didn't let them take "The Journal" itself away from them, but in terms of monetizing the asset with which they started, the thrust of investors and everything, businesses throughout the country -- people didn't think of anything else, that -- to monetize that -- it could have been a company that was worth \$50 billion now instead of \$5 billion.

Charlie Rose: It's incredible.

Warren Buffett: Yes.

Charlie Rose: What's interesting about this is you, when something like that comes up, that interests you, that is a great painting, I don't care where it is and what it is, you can take a look at it, knowing that if it works for me, I can have a slice at it.

Warren Buffett: That's probably true.

Charlie Rose: That must bring you some sense of challenge, excitement.

Warren Buffett: Yes, you've got to be sure it doesn't bring me too much of that. You can do pretty dumb things if you have a big checkbook, as you get captivated by an asset. No, in the end, I'm working for our shareholders.

Charlie Rose: I know you are. But in fact, you are now looking for a successor on the investment side.

Warren Buffett: Absolutely.

Charlie Rose: You have decided, as you think about succession, that there are three people who could be the CEO.

Warren Buffett: Absolutely.

Charlie Rose: And those names are known to the board of directors or the executive committee or somebody.

Warren Buffett: Yes.

Charlie Rose: And you have chosen who, if something happened to you today, would be the next CEO of Berkshire, correct?

Warren Buffett: The entire board has chosen. And we met Monday and we reaffirmed.

Charlie Rose: You reaffirmed. So it could change a year from now, because you make a different decision because of intervening events.

Warren Buffett: Yes. The person could become injured or --

Charlie Rose: Here is what is interesting. You now have announced that you are going to look for someone who is going to be your successor as the investment guru.

Warren Buffett: Right.

Charlie Rose: One of the criteria is they understand risk.

Warren Buffett: They've got to.

Charlie Rose: They are not going to risk the entire thing that you have spent your lifetime building. Talk about that.

Warren Buffett: Well, I have seen all kinds of people with 160 IQs, with intense interest in the subject, lots of experience in the investment world, I have seen them self-destruct. And you have to have a certain amount of -- of natural flow of juices just to be excited about the game and down there participating. And the trick, of course, is to keep control of those juices. And most people, even very smart people, have trouble not getting caught up in the game and thinking, I will just dance one more dance, you know, like Cinderella, five minutes to 12 something like that. Because they think they're smarter than the rest of the public. And that even though they know it will end, they will get out a little sooner. Or they don't protect themselves against something that will come totally from right field. I mean, long-term capital management was a good example of that. So I am very conscious of never turning investments at Berkshire over to someone that I think might have this tiny fatal flaw. Make all kinds of money most years, but if you take the numbers 28 -- we'll talk percentages -- 28 times 33, times 17, times 22 times zero, the answer is zero. You can't have a zero in there. And I have seen a lot of people put up a lot of good numbers, and then they stuck a zero in there.

Charlie Rose: And it was over.

Warren Buffett: It's over. And it's -- you go back to go. I want someone not only that can see the known risks, the ones that they've seen before, but that they can see around the corner the ones that haven't happened yet. I mean, when I have the classes out to Omaha to talk to, I ask them -- and these are bright kids, really bright --

Charlie Rose: Let me just explain that for a moment. You have had in 2006/2007 school year 35 --

Warren Buffett: Universities.

Charlie Rose: Universities have come to Omaha for a lunch at Gratz with you.

Warren Buffett: I spend about five hours with them.

Charlie Rose: Including Brazil as well.

Warren Buffett: Brazil --

Charlie Rose: Tell me what you were going to say and what this dialogue is about and why it is important to you.

Warren Buffett: Well, when I -- I usually got 150 or so souls sitting in the class. And you know, these are MBAs and they're interested in finance. And I will ask them how many have heard of the Northern Pacific Corner. And usually no hands go up at all. Well, one of the things I did when I was 10 or 11 years old, I read every bit of financial history I could, because it isn't just about the figures on the chart last week; it's how human beings behave. I talked to Alan Greenspan one time about the Northern Pacific Corner, he knew all about the Northern Pacific Corner. But you have to be aware of the fact that human beings can do things that just blow your mind. I mean, think of what Hitler did in Germany. I mean, there just -- there is just -- the scope of human beings to do crazy things, self-destructive things, things that as a mob they do. I mean, you saw it on October 19th, 1987, you saw 22 percent of the market dive. Did something happen to change --

Charlie Rose: Stock market crash of '87, October --

Warren Buffett: Twenty-two percent, one day. You saw, you know, long-term -- you've seen all kinds of things. There will be other things in the future. There will be -- they will have similar factors. The human factor will be at the bottom of them. But they won't be exactly the same, but it's like Mark Twain said, you know, history doesn't repeat itself, but it rhymes. And we will see some things that rhyme, you know, with 1929, or whatever it may be. And I have to have somebody in the position who can think about those things and never get exposed to getting crushed by the herd.

Charlie Rose: This is so crucial that what you are going to do, as I understand it, you are going to select three or four more, you are going to give them \$1 or \$2 billion, and watch them. How will you measure, beyond this performance as you take a look at this, whether they have the quality you just described?

Warren Buffett: And I will look, incidentally, at what they've done for themselves for the previous 10 years. I mean, I can tell much more by looking at how they've swung at each ball over the year than having them hand me some score at the end of time. So it won't just be their performance, but it will be how they achieved that performance. And I can read a lot into that. I've done this twice before in my life, Charlie. I mean, when I got out of my partnership, I picked three people, actually, and one of them was the one that most (ph) went with. And all three of those turned out to be 37 years later, all three of those were good choices, not because they just manage money well, but they didn't self-destruct either. And I picked one for Geico at one time. So it is not impossible. It's more difficult for me now, because I'm not a contemporary of these people. I don't know the crew of the 40- or 50-year-olds like I knew it when I myself was 40 or 50.

Charlie Rose: You've got -- you are looking for somebody who is in their early 40s, probably.

Warren Buffett: Yes, but they could be -- they could be 35, they could be 50. They can't -- they can't be 76, because I -- I know a 76-year-old --

Charlie Rose: Who likes this --.

Warren Buffett: Who likes his job.

Charlie Rose: Yes, plus you've got Lou Simpson, who's great.

Warren Buffett: Sure. Sure.

Charlie Rose: And could do it, but he is (inaudible) --

Warren Buffett: I like Charlie, but Charlie is 83. But he's going good.

Charlie Rose: But he doesn't know it.

Warren Buffett: He doesn't know it.

Charlie Rose: In the annual report letter to the stockholders as well, you once again talk about the trade deficit, what they call the current account deficit. It is one reason that you believe that the dollar will continue to decline.

Warren Buffett: Right.

Charlie Rose: Talk about that. I mean, we are in a sense giving up our assets --

Warren Buffett: Right.

Charlie Rose: -- in order to feed our spending habits.

Warren Buffett: Exactly. And it's a drip, drip, drip kind of thing. So you know, it's like sitting down at a table and having one extra piece of toast every day compared to your normal diet. And you don't all of a sudden get up and everybody says after the one -- and say, my God, you look fat, you better give up that piece of toast. But if you keep -- if you keep taking in a couple hundred calories more than you are burning every day over a long period of time, you wake up some day and you find out you are in the kind of shape you wish you hadn't been in. And we have -- we're the richest country in the world. We've got lots of assets to trade. The rest of the world is happy to take them. They're happy to take our IOUs. They are not quite as happy as they used to be, which is why you have seen a declining dollar. But -- and we are not going to shake the habit of, you know, of consuming more than we produce. And it is a very tough problem in -- it's about \$2 billion --

Charlie Rose: But think about what you just said. I mean, if in the end we can wake up one day in a terrible place, then you just said we are not likely to shake the habit. This a forecast for doom.

Warren Buffett: Well, it isn't doom.

Charlie Rose: What is it then? If in fact --

Warren Buffett: Well, it's just a forecast for transferring a good bit of the ownership of your country --

Charlie Rose: To other places.

Warren Buffett: -- to other places, and then your children and your grandchildren essentially having to spend some of the time that they work every - every day, every week, to service the debts that you incurred a long time earlier. If it's - if it's just a budget deficit in the United States, you know, the debt you paid becomes the other guy's income. But when you're actually transferring to the rest of the world --

Charlie Rose: Yes.

Warren Buffett: -- now you live less well than you would otherwise.

Charlie Rose: In addition to that, to pay the cost of servicing that --

Warren Buffett: That's right.

Charlie Rose: -- you've got to probably - the companies are going to shift production overseas.

Warren Buffett: Well, it's hard to tell all the implications. But the one thing that's happened is that we always have owned the rest - more of the rest of the world than the world has owned of us. And since 1915, almost 100 years ago, they've always paid us more, because we've owned these assets there, than we've had to pay them. That has just turned, and then it will start growing --

Charlie Rose: In 2006, it turned negative.

Warren Buffett: Yes, it turned negative, and it will get more negative. Now, in effect, we have been somehow like - like a -- somebody with a savings account, we've used up our savings account to consume, and now we are using our credit card. And the interest charges haven't gotten big on the credit card yet, but if we keep using our credit card long enough, we start paying bigger and bigger, and after a while you start noticing it. But it happens slowly. Anything that happens slowly that's negative for the long-term consequences in a democracy is very tough for government to attack.

Charlie Rose: Two things that I know you, I assume, I don't know this, that if - if a Democrat -- most Democrats come to you looking for your support and your ideas.

Warren Buffett: And money.

Charlie Rose: Yes, that's what I mean by support.

Warren Buffett: I know. That's what they mean by support too.

Charlie Rose: That's what it means --

Warren Buffett: We'd like your support, Warren. Yes.

Charlie Rose: Exactly. And this is the number we have in mind.

Warren Buffett: That's right. That's our reminder.

Charlie Rose: Two things you want to talk about. One is the trade deficit with them, I assume, to develop some sense of urgency on the part of political people. The other thing, I assume, you want to talk to them about is the estate tax.

Warren Buffett: Yeah.

Charlie Rose: Or whatever --

Warren Buffett: And I would want to talk to them about weapons of mass destruction too.

Charlie Rose: Of course.

Warren Buffett: Yeah.

Charlie Rose: What would you say to them about weapons of mass destruction?

Warren Buffett: Well, I mean, in the last presidential campaign, both candidates, if you remember, one -- one of those debates they were asked what the most important question was, and that's it. But what it's very - it's tough to tackle, Charlie. I mean, I'm sympathetic to some extent --

Charlie Rose: Yes.

Warren Buffett: -- it is the most important. Our economy over time will do fine. I will guarantee you that your children or grandchildren will live better than you live if they live at all. I mean, that's - that's the real question. And - and you know, there are very significant number of people, organizations, and even a few countries in the world that wish us evil. And their capacity to inflict damage on us because of the fact they wish us evil is many-fold what it would have been 50 years ago. And - and you know, we have to be terribly conscious of that.

Charlie Rose: OK, but what would you have political leadership do that they may not be doing?

Warren Buffett: I would -- we've got Nunn-Lugar, for example --

Charlie Rose: Right. Right.

Warren Buffett: -- in terms of working with the Russians. But --

Charlie Rose: In terms of making sure their weapons are under control.

Warren Buffett: I would -- absolutely. You know, there is a lot, there is --

Charlie Rose: Right.

Warren Buffett: There is a lot of - there is a lot of material around the world that might be susceptible to the wrong people getting their hands on it. And it extends beyond, you know, into the biological --

Charlie Rose: It's the ultimate fear. The ultimate fear is a - is a convergence of the terrorists with a nuclear weapon.

Warren Buffett: Absolutely. Or with a biological weapon.

Charlie Rose: Or a biological or a chemical weapon.

Warren Buffett: Sure.

Charlie Rose: Yes. Are you -- have you chosen a candidate in the 2008 political race?

Warren Buffett: I have two candidates that I would love to have either one of them be president of the United States, and that's Hillary Clinton and Barack Obama. And I think that they both would make terrific presidents.

Charlie Rose: Prefer one over the other?

Warren Buffett: No. Just -- I just, I don't want to turn my back on either one of them and turning toward the other. But I think they - they both would lead us to a better America. I think we've got a pretty good America already.

Charlie Rose: It has been very good to you, as you say --

Warren Buffett: Absolutely.

Charlie Rose: There is this thing called ovarian lottery, and you have benefited.

Warren Buffett: It's a wonderful America. But it - it now has reached a point -- well, it has always been -- we could do better, but we can do better than we're doing in terms of -- in terms of taking care of 300 million people instead of taking care of just guys like me.

Charlie Rose: And you have a belief that they will do that, they have ideas and programs, intelligence and energy to do that.

Warren Buffett: And leadership abilities. You have to get people behind you. You have to get people to aspire to things that they haven't really thought about too much before. And I - I think both of them would be great leaders.

Charlie Rose: There is this also. I mean, this country has been so great to you and you - you --

Warren Buffett: Sure.

Charlie Rose: -- make note of that all the time. Part of the reason you could do what you have been able to do is you were born in this country.

Warren Buffett: Yes.

Charlie Rose: You came at the right time, you had parents who gave you the right values, all of those things.

Warren Buffett: Stick me down in Afghanistan and I walk down the street saying "I allocate capital," they say, "buddy, get a job."

Charlie Rose: But look at these circumstances as well -- you did better in investing in the South Korean stock market than you did in the American stock market. Now, I don't know what that says, but it must say something.

Warren Buffett: Well, it just means South Korea -- it really means that South Korea went through something in 1997 and '98 where people sort of wrote it off. They got in trouble --

Charlie Rose: Yes.

Warren Buffett: -- and the IMF came in, and all -- and so people formed an idea of South Korea in 2002 that was based on 1997 and '8, which was long past. The market has this habit of looking in the rearview mirror instead of outside -- through the windshield. And - and they were looking at South Korea in the rearview mirror, when the windshield, you know, was bright. And - but that didn't mean that South Korea was a better place to start a business or to live or anything else. Although, you know, they have done very well.

Charlie Rose: You like them, South Koreans?

Warren Buffett: Yeah, but - but their stocks were very, very, very cheap. They were ridiculously cheap a few years ago. And our stocks were -- they were somewhat cheaper than they are now, but they were nothing like the low valuations of South Korean stocks a few years back.

Charlie Rose: You are, it is fair to say today, looking more overseas than you ever have before?

Warren Buffett: Yeah. I have always looked overseas. But we're looking more, that's true.

Charlie Rose: In part because of what you -- you don't bet with - you don't bet against the currency by currency trading anymore. You bet against currency by making investments in international companies --

Warren Buffett: Yeah.

Charlie Rose: -- or B, by buying, as you did in Iscar, international companies.

Warren Buffett: International earnings. Now, we still have more in the United States. We'll always have more in the United States than anyplace in the world. I mean, we have all these businesses. Most of them earn most of their money in the United States. But we - we are developing more earning power, both direct through a company like Iscar --

Charlie Rose: Right.

Warren Buffett: -- and indirect, which we've always had in Coca-Cola or Procter & Gamble, and things like that.

Charlie Rose: Whose markets are Web-extensive --

Warren Buffett: Yeah.

Charlie Rose: -- around the world.

Warren Buffett: Around the world. And they will -- with most of those companies, their international earnings will grow faster than their domestic earnings. And then on top of that, they will probably get some currency kick over the years. It's not an overwhelming factor with me, but it's something that I consider.

Charlie Rose: Why did you -- you made \$2.2 billion in currency trading. Why did you stop doing that?

Warren Buffett: Because interest rate changes made it so that there was a negative carry to most currency trades rather than a positive carry. And therefore, previously if the currency stayed at the same price, I would make a few hundred million dollars a year. Now if the currency stayed at the same price, I would lose a couple of hundred million a year. So the carry went negative. I don't want to get too technical now, but it made it more expensive to own those currency positions in that manner. And instead, I just decided that it was a better way to attack it was to have foreign earnings directly in other currencies. And there, I've got a positive carry.

Charlie Rose: Yeah. One of the investments you have is PetroChina --

Warren Buffett: Right.

Charlie Rose: -- \$3.3 billion or something, whatever it is. Or shares -- I'm not sure what it is.

Warren Buffett: Now, wait, it -- the value of the investment would be a little under \$3 billion now. We paid about \$400 million.

Charlie Rose: It sounded like a typical investment -- You paid 400, it's now worth 3 billion. You pay 10 million, it's now worth 2 billion --

Warren Buffett: No, no, no. Well, believe me --

Charlie Rose: Let's talk about Coca-Cola!

Warren Buffett: Yeah.

Charlie Rose: Having said that, though, what you did at the annual meeting was interesting. Some people believe that Berkshire Hathaway should make investments or should divest investments in companies in China, especially in the oil business, because they say China, which buys a huge percentage of its oil, in terms of the production of Sudan, and that you could influence the Chinese government if you would make a public statement by disinvesting in China, PetroChina.

Warren Buffett: Yeah. PetroChina is 88 percent owned by the government of China. And the government of China is a big player in the Sudan.

Charlie Rose: I think they buy 70 percent of their oil.

Warren Buffett: They don't buy 70 percent. They may - they may - they may take 70 percent of the production to the Sudan, yeah --

Charlie Rose: OK.

Warren Buffett: But China is going to be --

Charlie Rose: They buy 70 percent of Sudan's production.

Warren Buffett: Yeah. Although the Sudan - Sudan would sell that oil to somebody else.

Charlie Rose: Right.

Warren Buffett: I mean, oil is a commodity. So you don't know where the oil in your tank comes from, you know. Basically --

Charlie Rose: The point I just tried to make, obviously, is - is -- can you by investments or not investing influence the conduct of governments? In this case, one of the fastest growing economies in the world?

Warren Buffett: Yeah, yeah, I would say that the odds of anything I do changing the Chinese view of what they do is about like the -- if I could change the view of the United States government by doing what I do, or the Omaha city council. I mean - I mean in the end, you know, it would get - it would get a story, you know, Buffett does this, and says so-and-so. But I actually wrote the head of PetroChina about two years ago, because they were having a small issue of stock, which I didn't think was a good idea. I mean, I thought they should not dilute the stock. It was a small one. And you know, I got a very nice letter back from them, and they said, you know, we would love to have you as a shareholder and we respect your views, and we're going to issue the stock. And of course, they do. I mean, but that happens in the United States. I mean, in the end, the government of China is going to do what they think is in the Chinese interest. And - and - and they don't really -- the idea that Berkshire Hathaway selling stock in a subsidiary, they -- Chinese government owns the controlling interest in 32 of the 33 largest publicly owned companies in China.

Charlie Rose: Say that again?

Warren Buffett: They -- of the 33 largest publicly owned companies in China, the Chinese government is the majority holder of 32 of them. I mean, believe me, the Chinese government is -- I mean, they - they are a strong factor in all major business over there. And they have policies. And it's up to them, you know. They are not going to be swayed by the managements of those companies, you know. They're not going to be swayed by me. They're not going to be swayed by -- they may not be swayed, for all that matter, by Hank Paulson, although he is very good and they like him. So, it would be a futile sort of activity. Now, going beyond that, the Chinese government is a participant with the Sudanese and oil projects over there. If the Chinese government were to divest, they can't take the oil and go home. They can't take the pipelines and go home. They have to sell to somebody. They can sell to one of two people. They can sell it to the Sudanese government itself, or they can sell to some other country that wants to be a partner. If they sell to the Sudanese government, they are going to get paid a pittance compared to the value of assets. Sudanese government is going to be better off if they could get them to sell.

Charlie Rose: Right.

Warren Buffett: The -- if they sell to some other entity, my guess is the Sudanese government would - would renegotiate the terms for even better terms to have the assignment take place. I mean, you can't -- it isn't -- you can't divest yourself in the sense of taking the assets back. 400,000 barrels a day of oil are going to get produced in the Sudan. They are going to get sold. And frankly, the United States government will be unhappy if they weren't being sold, because that would be 400,000 barrels of oil less in the supply of the world, and that would have -- oil prices would go up. Everybody in the United States would pay more for gasoline if they quit producing oil in the Sudan. I mean, it would take a significant amount of production out of the world supply, which is pretty tight now.

Charlie Rose: Sure.

Warren Buffett: It's a, you know -- what is going on in Sudan is absolutely terrible. But the idea that a shareholder of PetroChina is going to change the Chinese government's policy, or that - that having China leave the Sudan would hurt the Sudanese government, those are very tenuous propositions.

Charlie Rose: I'll tell you what looks like it did have an influence on the Chinese government was - was the --

Warren Buffett: The Olympics.

Charlie Rose: The Olympics.

Warren Buffett: The Olympics.

Charlie Rose: You know, I mean, that's just going to be their showcase and they want to make sure.

Warren Buffett: They care about the Olympics.

Charlie Rose: You know --

Warren Buffett: Huge.

Charlie Rose: And so as soon as that began to hit the screen in terms of Darfur, the Chinese - the Chinese government went to Darfur and said --

Warren Buffett: The prestige of China, I mean, it is -- I don't think we can fully understand even, you know. What I mean, we love having the Olympics here, maybe in Atlanta or something, but it is nothing like how they feel, I'm sure, about having the Olympics in Beijing.

Charlie Rose: Let me talk about philanthropy for a second. In August of last year, with great attention, you announced this gift to the Gates Foundation and also four other foundations. Your three children and a foundation named after your late wife, I think.

Warren Buffett: Right.

Charlie Rose: You -- when you look at that now, have you just been reaffirmed, do you believe it was the right thing, have further considerations, raised any questions for you?

Warren Buffett: Charlie, I love it. I mean, it's done. It's exactly what I wanted to do, you know. I mean -- I want the money put to good use, you know. I've got these little pieces of paper down in a safe deposit box. You know? They're just sitting there. And you know, now they can translate themselves into vaccines or education or whatever.

Charlie Rose: Right. Right.

Warren Buffett: And the real question is how to have it done best. And my kids do a sensational job. Bill and Melinda will do a sensational job. Alan - Alan -- I mean, it is a chance -- and frankly, I love what I'm doing. So, and if I do it well, they'll have more value to what they do. So it's ideal. I mean, there is not one bit of it I would change in any way, shape or form.

Charlie Rose: There is this, which is interesting. And you mention this in the stockholders letter -- a lot of what I know about how you think about business comes from the stockholders' letter -- it is your book, as you have frequently said, and Carol Loomis says and everybody who knows you says.

Warren Buffett: Yes.

Charlie Rose: You talk about the notion that if you look at -- you think in 25 years out, that you your life span may be if you look at (inaudible) another 12, 13 years.

Warren Buffett: Maybe 10 minutes or maybe 20 years, but it won't be 50 years.

Charlie Rose: And you also -- you also know that in your will, it would take probably three years to settle the will.

Warren Buffett: Yes, my lawyer would like it to last longer, but we'll try to --

Charlie Rose: So essentially, you want all the money to be given away in 25 (ph) years.

Warren Buffett: I want the money to be given away. And -- go ahead.

Charlie Rose: Go ahead. You tell me, and?

Warren Buffett: Well, I have made a decision that I've got these terrific people in place to do it. I see they're working on the right things. I know their goals. I don't look at each individual decision at all. But I don't know what the situation would be 50 years from now, when it becomes another generation and all that. And I -- I am a big believer, you know, in betting on what you know about rather than some unknown. So why should I assume that somebody 50 or 60 years from now that I have never seen -- may not even be born yet -- will do a better job than the people that I know right now and have actually selected? So the interesting thing about foundations is there is really no market test to them. I mean, most of the things we do in this country, there is a market test to. But with foundations, they go on and on and on, and the good one goes on, the bad ones go on, the ones that are stagnant go on. And I believe in the money getting spent while I know you've got the right people in place working on the right things. And then 50 years from now, there will be plenty of philanthropic needs and there will be plenty of very rich people. And if the ones that I've supported now have done a great job, they can make a case to the philanthropists of that time and say, look at -- look at what I did with Buffett's money. I will do even better with yours. And they could -- if they meet that test, they can have people give them money. And if they don't, they go out of existence, and somebody else replaces them.

Charlie Rose: Have Bill and Melinda gotten you more interested in how they use the funds, or do you simply say I trust them, I want to be informed, but what I love doing is running Berkshire?

Warren Buffett: The latter. I mean, I'm a big guy at outsourcing. I mean, I didn't deliver my own three children. I called an obstetrician. I do not want to have some member of my family fill my teeth or try to do it myself. So if somebody can do a job better than I can -- and they can in all kinds of things -- they can play the ukulele better than I can -- I will have them do it for me. And people have me run their money because they think I will do a better job than they do. I have these people distributing the money, because I think they will do a better job than I do. And you know, it makes perfect sense in every other field. Why shouldn't it make sense in philanthropy? The one good thing particularly that has happened since we talked last on this is I have heard from a number of people, not only in this country but outside this country, that they are rethinking, and in some cases they have actually implemented some major changes in their distribution of funds. I have had people tell me they've given away significant amounts of money. They weren't thinking about it at all, but they did think about --

Charlie Rose: You have been a stimulus for people to make charitable contributions --

Warren Buffett: I think so.

Charlie Rose: -- now rather than later.

Warren Buffett: Yes, yes. And I've even been a little of a stimulus I think maybe on this idea that you don't set up the professional things. I mean, I have heard from people that way. And I have heard from one fellow, for example the other day, who was going to put \$1 billion in. And I think he will put the billion and --.

Charlie Rose: Put it into a charitable foundation? How about bringing money to the Gates Foundation?

Warren Buffett: Well, they've had a number of proposals. I think they are going to start accepting some money from outside. They -- I think they were kind of surprised by that, but they . . .

Charlie Rose: Bill and Melinda Gates.

Warren Buffett: Bill and Melinda, yes. And so they rethought -- they rethought the thing. They hadn't ever planned to do that, but I think they're going to do that.

Charlie Rose: Part of the reason you chose him is, A, is friendship, and B, you had great respect for what they had done, and how they had gone about building --

Warren Buffett: I have seen them do it. I mean, if you tell me you are going to play in my place in a golf tournament this year, you know, and you are going to shoot a 69 -- you know, maybe you will, maybe you won't. But if Tiger tells me that, I hand him the clubs.

Charlie Rose: Do you know anybody that is having more fun than you are that comes to mind?

Warren Buffett: I don't think so. Certainly not legally.

Charlie Rose: You also, though, have been critics of the way American -- you are not thrilled, as you say in the stockholders' letter, or you have some reservations about what you call the 2 and 20 crowd.

Warren Buffett: Yes, well, I don't blame them for in a sense for getting what they could get. But the idea that a significant percentage of the investment money in the United States can be run and pay fees of 2-and-20 to managers to do it, and that group can achieve better than average results after those fees strikes me as just nonsensical. It won't happen. I'm not saying that if a tiny little portion was run by people that had those fees that that group couldn't over-perform, but a large sum simply can't over-perform. But the managers will do very well, and they will do very well even if they fall on their face.

Charlie Rose: You complain about the fact that they take 2 percent off the top whether it does bad or well -- good.

Warren Buffett: It is very interesting. Some of them would be running mutual funds where they get a half a percent. And with no performance fee, and then they go over to another field and say, well, we're so good that we deserve a performance fee, but we now need four times, 2 percent minimum fee, you know, otherwise it isn't worth us coming to the office in the morning.

Charlie Rose: You even suggested 20 percent, you know, as a rising tide, and then some of them will get 20 percent just because of that, rather than taking, as I think your deal is with Lou Simpson, you take 10 percent of something that does better than a certain standard.

Warren Buffett: Right. That's exactly right. And the idea, well, it would be like going out to the race track, you know, I mean, and tout -- touting a different horse to each of 10 people. I mean, he is going to get a winner. Well, if you set up a partnership in each of 10 years going out and you get 2 and 20, there are going to be three or four years there, you know, where an orangutan would have made 25 percent, and then you get a big fee, and then the losses come and the guy says, well, too bad, I will start another relationship.

Charlie Rose: But somebody must love them, because money is just flowing into them from pension funds and everywhere else, these people.

Warren Buffett: Yes, well, I had a brother-in-law down in the stockyards in Omaha. And I said, what do you tell these farmers when they come in? You know, you can sell their pigs, the other guy can sell their pigs? He says, Warren, it isn't how you sell them, it's how you tell them.

Charlie Rose: There's wisdom in the stockyard, is there not?

Warren Buffett: That's right.

Charlie Rose: There are now 19 people at the headquarters of Berkshire Hathaway.

Warren Buffett: Yes, we've gone crazy. Yes. Shows you what's happening when the boss is away.

Charlie Rose: Nineteen people. What are they doing?

Warren Buffett: Well, we have these 73 operating businesses. Our tax return was over -- our federal tax return was over 10,000 pages last year. That gets done in our office. We have got state income tax returns, we've got foreign returns, we've got SEC matters. So we have a fair number of people in accounting. We don't have -- we don't have a human relations officer, we don't have an investor relations, we don't have public relations. We don't have all kinds of things like that. But there is a certain amount just in being a large public company. We get pretty busy around quarter-end times and --

Charlie Rose: This question leads to this question. You are doing -- the fact that you have built this up over 42 years as CEO of Berkshire Hathaway, most of that, almost all of that, was one man, reading a lot, talking a lot on the telephone, meeting a lot of people and making decisions for the long-term.

Warren Buffett: And getting a lot of people out running a business.

Charlie Rose: Sure, that was part of buying the businesses. You bought -- you invested in businesses, and you bought businesses that you believed in the people running.

Warren Buffett: Right.

Charlie Rose: But there is one man in Omaha -- I mean, this is extraordinary, I think -- making these decisions -- out of passion, out of love, out of knowledge, out of principles, out of an architecture of analysis.

Warren Buffett: I just got to paint my own painting, you know? I mean, I just sit there, keep painting, and it will never be done. And I enjoy watching this canvas get larger and larger. And -- but it isn't hard work. I mean, you know, if any shareholders are listening, I would like to tell them, you know, I'm bathed in sweat at the end of the day. But no, it just isn't hard work. I play bridge every night. It's -- you can make it hard work. You could have -- we could have that whole building filled with the divisions reporting to each other, and I could have lots of data coming in, you know, on-time sales of how many, you know, how many boxes of peanut brittle did we sell at See's Candy yesterday. I get a lot of figures, and they are -- the important ones. But it could be all kinds of make-work stuff. We don't have committees. I mean, if we had committees, you know, we would be talking about 75 people, then we'd have other committees that were liaisons between the committees, and then they would be going to conferences and reporting back to the others what they learned. You know, it just goes on endlessly. We don't have any of that.

Charlie Rose: What was it Ronald Reagan said about work?

Warren Buffett: Yes, well, Ronald Reagan said, he said -- he said, "they tell me that hard work never killed anybody." But he said, "I feel, why take the chance?"

Charlie Rose: There is also this, as I mentioned. You have married again to Astrid Menks, who's brought what to you?

Warren Buffett: Oh, she takes care of me. I mean, it's terrific. You know, I lived with her for a long time, and Astrid is -- you couldn't find a better person in the world. My life is -- I've been charmed.

Charlie Rose: Thank you.

Warren Buffett: Thank you, Charlie.

Charlie Rose: Pleasure to have you here. Pleasure to be your friend.

Warren Buffett: Thank you.

Charlie Rose: Thank you. Warren Buffett.

Warren Buffett (2008)

10/1/2008

Charlie Rose: Warren Buffett for the hour, next. We are in San Diego, California this afternoon for a conversation with Warren Buffett. He is the man Congressional leaders, the administration and the Federal Reserve want to talk and talk to. He is a legendary chairman and CEO of Berkshire Hathaway. Its success has made him th world's richest man. He's admired for his investment results over a long period of time. He is trusted for his common sense and the fact he has warned over the years in his annual letter to stockholders about some of the things that are contributing to the crisis facing America and the global economy. For all those reasons, we have come to see him in San Diego, where he is attending the "Fortune Magazine's" most powerful women summit. Later, he will be interviewed at that conference by the "Fortune" reporter and long time friend Carol Loomis. We come this evening from the studios of our public television affiliate in San Diego, KPBS. i thank my friend Warren Buffett for taking time in a busy schedule to talk to us.

Warren Buffett: My pleasure, Charlie.

Charlie Rose: Let me talk of the news today. You have announced an investment of three billion dollars in General Electric, along the same terms as the Goldman Sachs.

Warren Buffett: Almost identical.

Charlie Rose: Why GE?

Warren Buffett: Well, I got a call this morning from a friend of mine at Goldman Sachs saying they might be interested in such an investment. I'm familiar with the company. I've known the management, the current management, Jack Welsh, before Jeff Immelt. I've known him for decades. So I understand their businesses. We do a lot of business with them. And GE is going to spend -- I think it's the longest running stock in the Dow Jones Industrial Average. It will be another 100 years now it will be around. I hope I'm around then too. It was an attractive investment. We've had a lot of money over the last few years and we're seeing some things that are attractive now.

Charlie Rose: Are you looking at other things?

Warren Buffett: I look at everything, Charlie. That's my job. I really do, every day. I think about everything.

Charlie Rose: Cash is said to be king now. Are you sitting on a lot of cash so that this is the time for Berkshire Hathaway and Warren Buffett to look carefully at a lot of opportunities.

Warren Buffett: We want to use cash. The reason we haven't used our cash, two years ago, we just didn't find things that were that attractive. But when people talk about cash being king, it's not king if it just sits there and never does anything. There are times when cash buys more than other times, and this is one of the times when it buys a fair amount more. So we use it.

Charlie Rose: There's a time accumulate and a time to spend.

Warren Buffett: Absolutely. You want to be greedy when others are fearful. You want to be fearful when others are greedy. It's that simple.

Charlie Rose: Where are they now.

Warren Buffett: They're pretty fearful. In fact, in my adult lifetime, I don't think I've ever seen people as fearful economically as they are right now.

Charlie Rose: Why is that, do you think?

Warren Buffett: Well, it's because they have seen the credit market seize up. They've gotten worried about money market funds, although the latest proposition from the government should take care of that. They've seen eight percent of the bank deposits in the United States get moved, very skillfully, I might say, within the last couple weeks from institutions that they thought were fine a few months ago to other institutions. They're not wrong to be worried.

Charlie Rose: Is it being felt, as people often point out, on Main Street?

Warren Buffett: I heard about auto sales today. If you're an auto dealer, you're feeling it. If you're a furniture retailer, like we are, you're feeling it. If you're a jewelry retailer, you're feeling it. I know some of these businesses because we're in them. It's being felt, but it will be felt big time more if we don't do something about it.

Charlie Rose: The Senate will vote sometime this evening. Are you satisfied with that rescue plan?

Warren Buffett: Well, I don't think it's perfect, but I don't know that I could draw one that's perfect. I would rather be approximately right than be precisely wrong. It would be precisely wrong to turn it down. We need -- we have a terrific economy. It's like a great athlete that's had a cardiac arrest. And it's flat on the floor, and paramedics have arrived. And they shouldn't argue about whether they put the resuscitation equipment a quarter of an inch this way or a quarter of an inch that way. Or they shouldn't start criticizing the patient because he didn't have blood pressure tests or something like that. They should do what's needed right now and I think they will. I think the Congress will do the right thing. I think they've gotten into certain arguments and then they start worry about assessing blame and there's a little demagoguery. In the end, something this important, they'll do the right thing. This is really an economic Pearl Harbor. That sounds melodramatic, but I've never used that phrase before. This really is one.

Charlie Rose: Go through why that is true, beyond the fact that there's a freeze on credit, beyond the fact nobody's making loans, beyond the fact that banks don't lend to banks, beyond the fact that Treasury bills are at a low.

Warren Buffett: When 40 billion of Treasury bills are sold, like they were last week, seven day Treasury bills, at a yield of 1/20th of one percent, that means the whole country is basically at the point, virtually -- a lot of the country is at the point of putting their money under the mattress. You're only 1/20th percent away from where it's better to put it under the mattress. You don't want 300 million Americans putting their money under the mattress. This economy doesn't work well without the lubrication of credit and trust. That's been lost. It's a huge problem. What you have is you have the major institutions of the world all wanting to de-leverage. They want to take down their assets and liabilities. What seemed so easy to borrow against a year ago now looks like rat poison to them. So they're trying to de-leverage. There's only one institution in the world that can leverage up in a way that's at all a countervailing force to that. And that's the United States Treasury.

Charlie Rose: Are you approving of what's been taking place along the stages that got us to where we are now. Whether it's Bear Stearns or Lehman Brothers or AIG, Freddie and Fanny, or what you've done with Goldman Sachs and the rest?

Warren Buffett: I think basically the right things have been done, but no one saw the tsunami coming fully. When Bear Stearns came along, it looked like if you stopped the flood at that point, you didn't have to worry about being down stream from it. And I think the Fed did the right thing there. And I really thought that would probably halt runs on other major institutions, but it didn't. We have seen wave after wave. And admittedly, there has been somewhat of an ad hoc response to it. I would rather have an ad hoc than no response at all. I don't think the Treasury could remotely have gone to Congress three or four months ago and laid out the scenario of what's happened and been credible and gotten the necessary tools. I think it took a crisis like this.

Charlie Rose: And asking for the powers they asked for and the levels it was asking for.

Warren Buffett: They wouldn't have gotten it. I think it's been kind of like a tragic play to this point. But at this point, I think it's clear and will be clear to the majority of the Congress, and I think it's clear to the American people, that there is only one countervailing force to a world where financial institutions are trying to sell instruments every day, and where credit is dried up. And that's the United States Treasury.

Charlie Rose: At the same time, there has been, and Congressmen and women will tell you this, a resistance across the country because they think, as you well know, it's a bailout of Wall Street, and that they are sitting there in their own economic life, and nobody's coming along to say we're here to help you; we're from the government.

Warren Buffett: Well, the patient that's on the floor with the cardiac arrest is not Wall Street. It's the American economy.

Charlie Rose: Do you think they understand that yet?

Warren Buffett: I think they probably don't and I think any time you couple the term Wall Street with bailout or something like that -- you know, I don't like what's going on in Wall Street. I don't like what's going on in executive compensation. But I don't want to give a lecture to this body that's out there having had the heart attack. I want to get it back functioning. As a practical matter, if you were at Bear Stearns and you were a share holder, you lost 90 to 95 percent of your money. Good many lost their jobs. They lost very cushy lives, many of them. If you were at Lehman, the same thing happened. If you were at AIG, the share holders are getting creamed on these things. Those share holders are not just a bunch of big shots on Wall Street. Those are pension funds. Those are investors all over the country. I wouldn't worry too much about that. Justice won't be perfect on it. You would be very mad at some guy who walked away with a huge golden parachute, but that really isn't the important thing. If Pearl Harbor came along, you could have said the planning was wrong by the military ahead of time, or maybe the battleship shouldn't have been in the harbor and all of that kind of thing. It doesn't make any difference. It's Pearl Harbor. You better not spend weeks and weeks trying to assign blame or deciding on a complete plan for fighting the whole war, and letting a committee decide where the battleship should go and all of that. You better spring into action with the best people you have.

Charlie Rose: You have never seen anything like this in your life?

Warren Buffett: No, I haven't.

Charlie Rose: There are those who argue that we're headed for a recession, you know, and they look at Depression as the great fear.

Warren Buffett: Sure.

Charlie Rose: Is that a possibility if this plan doesn't work.

Warren Buffett: Yes, it's a possibility. We have about 6.1 percent unemployment now. We've been in a recession by any common sense definition, because if you look at the American public, they've got 20 billion -- 20 trillion, I should say, worth of residential homes. They've got 20 trillion worth of stocks, roughly. Those are the two big assets of American families. They're both down dramatically for different families. But 95 percent of the people, at least, are worse off in terms of their residential wealth plus stock wealth from a year ago or two years ago. That is bleeding into the real economy. I mean that's bleeding into auto sales and jewelry sales and furniture sales and all that. But that wave is just starting to hit. And if the paralysis we have in the credit markets, if every company continues to feel all we want to do is get our balance sheet down, sell assets, it's just the start of what can happen. Unemployment's going to go up under any circumstances. The 6.1 is going to go higher. But whether it goes and quits at seven or whether it quits at 10 or 11 or 12 depends on, among other things, the wisdom of Congress and then the wisdom of -- in terms of carrying out the plan that Congress authorizes.

Charlie Rose: Would you say that this plan, which you have argued very strongly the Senate ought to pass and the House ought to pass, is simply the plan that we have and I don't have a better idea, but it's essential for the confidence of the nation and the system?

Warren Buffett: Yes. I just worry about whether it's enough.

Charlie Rose: Enough what?

Warren Buffett: Every day that goes by -- if you don't react to Pearl Harbor for a week or two weeks or three weeks, you're behind in the war that you otherwise would have fought. But it's very important that the determination of the U.S. Congress to do what is needed be made evident this week, and by the actions of most of the members. You're not going to get total assent.

Charlie Rose: What makes you confident that this plan will work?

Warren Buffett: I think you've got -- I don't think you could have a better secretary of the Treasury than Hank Paulson. He is in there at the wrong time. He probably should haven't taken the job. He's a friend of mine. But he knows markets. He knows how corporations work. He knows money. And he's got the interest of the country at heart. So you've got the right -- you've got a wonderful person with Sheila Berra (ph). Sheila Berra, in the last two weeks, has taken eight percent of the deposits of the United States and seamlessly moved those over to sound institutions, which in turn have gotten more capital. It's been a magnificent job, eight percent of the deposits of the United States, tens of millions of depositors. Nobody has ever heard of her. She'll never get a golden parachute or severance pay. She's done a great job. We have some great public servants. We have, I think, the right people in there to get the job done and they need more tools.

Charlie Rose: And those more tools might be, in addition to what's in this plan?

Warren Buffett: Well, they need plenty of money, and they really need plenty of flexibility to carry out this plan. They also need, in my view, to very much tie up the market prices. I have said, Charlie, that the 700 billion, if they buy mortgages related securities or mortgages themselves, at current market prices, they're going to make money over time because the United States government has staying power, and it has a low cost of borrowing. And if I could take one percent of that 700 billion pot and take the gain or loss from it and be their partner, and they would buy the stuff at market, I'd make a lot of money. No, it's -- I mean, you have hedge funds and people like that buying these assets to yield 15 or 20 percent. I mean, that's the buyer for these people that are trying to unload them. The U.S. Treasury has got borrowing costs like nobody else has. They can borrow basically unlimited amounts. They can stay there for years and

years. These assets will be worth more money over time. So when Merrill Lynch sells a bunch of mortgage related assets at 22 cents on the dollar, like they did a month ago, the buyer is going to make money and he's going to make a lot more money if it happens to be an institution like the U.S. government, which has very, very cheap borrowing costs.

Charlie Rose: So you are saying to those tax payers who are worried about what's going to happen to 700 billion dollars, chances are good that when these securities are purchased and sold, you will get a lot of your money back or all of your money back, and maybe something else.

Warren Buffett: I would bet on it. If I got a chance to take one percent of the deal either way, I'm going to make that bet. When Berkshire Hathaway laid out three billion dollars for GE today, we didn't spend it. We invested it. When the federal government buys the mortgages, they're not spending it, they're investing it. Now they're investing it in distressed type assets, but they're buying them at distressed prices, if they buy them at market. It's the kind of stuff I love to do. I just don't have 700 billion. Maybe we can go in it together. With your money and my brains, there's no telling how far we can go.

Charlie Rose: Whatever. I'll take the deal, whatever you want to do. There is this, though, in terms of alternative; some people have suggested, for example, that why don't we -- why isn't America doing what Berkshire Hathaway is doing? Why isn't that a better deal for America?

Warren Buffett: I don't think it would be crazy to have a model -- an entity modeled on the Reconstruction Finance Corp. That goes back to 1932, although it was really implemented in '33 under Jessie Jones. And it invested in mostly banks, initially, and preferred stock and that sort of thing. So there is -- there are two things needed in the system. The one that's needed overwhelmingly is liquidity. When people are trying to de-leverage, there has to be somebody there to buy. They don't have to buy at fancy prices, but to buy. Then there's also a capital problem with some of the institutions. We have provided capital here with a couple institutions recently. The federal government did that in the '30s for the RFC and I think there could well be a proper role for government in that.

Charlie Rose: Would that have been a better idea today?

Warren Buffett: It wouldn't have been big enough today. You couldn't have -- if you set up an RFC today and you gave them 100 billion dollars to invest in capital, there would be a very cumbersome type of application process. These assets are getting shoved out day by day and loans are coming to -- commercial paper are not being renewed. The commercial paper market, when that dries up, that's just like sucking the blood out of the economic body of the United States. And that's happening. So I would say that an RFC like thing might make sense. I probably would do it myself, but I don't think trying to combine that with what's going on now -- I think what's needed now is liquidity.

Charlie Rose: There are those who believe, and it has been suggested, that this is the time for Warren Buffett to answer the call of his government in a country that's been very good to him. What are you prepared to do yourself beyond run Berkshire Hathaway well?

Warren Buffett: That's my job. Any time I can be of help to the government, in terms of giving advice -- I've given a little advice, actually. Trouble is it gets when it really counts. But anyway, obviously, I'm here tonight talking about this for that reason. It isn't going to do anything for Berkshire Hathaway. That isn't really true. Anything that enables this economy to run in the manner that it should -- we've got the same plants out there we had two years ago. We got the houses. We've got people that are more productive than they've ever been in the history of this country. We've got a wonderful economic formula in this country. But right now it is being -- it's been brought to a halt by --

Charlie Rose: By?

Warren Buffett: It's the de-leveraging that's going on right now that has caused the credit crisis.

Charlie Rose: I mentioned earlier in this introduction to you, if you read your letters to your stock holders, which you write and Carol Loomis edits every year, and you think of your sister as a person --

Warren Buffett: I have two sisters.

Charlie Rose: You have talked about derivatives. Derivatives are, in part, at the core of this problem.

Warren Buffett: AIG would be doing fine today. It was one of the ten largest companies of the United States in terms of market value, over 200 billion, the most respected insurer in the world. If they never heard of the word derivatives, they would be doing fine. Everybody would be going to work in the morning and they would have no troubles. But they -- it was very easy to do, because very tempting to write numbers on little pieces of paper, and you can kind of report the profits you want, and there's no limit on it. I mean, there's no capital requirements to it or anything of the sort. And basically I said they were possibly financial weapons of mass destruction and they have been. I mean, they destroyed AIG. They certainly contributed to the destruction of Bear Stearns and Lehman, although Lehman had other problems too.

Charlie Rose: I'm interested in this, because people are asking me, did people get away with murder here? Were there people who simply gamed the system and took advantage and made huge amounts of profit and we had excesses that inevitably led to where we are today?

Warren Buffett: We had all of that. But I would say the biggest single cause was we had an incredible residential real estate bubble. You can go back to tulip bulbs in Holland 400 years ago, human beings going through combinations of fear and greed and all of that sort of thing, their behavior can lead to bubbles. And they've had an Internet bubble at one time. You've had a farm bubble, farm land bubble in the Midwest, which resulted in all kinds of tragedy in the early 80's. But we've had 300 million Americans, their lending institutions, their government, their media, all believe that house prices were going to go up consistently. And that got built into a 20 trillion dollar residential home market. Lending was done based on it. And everybody did a lot of foolish things. Where people really behaved in a fraudulent way or something, they'll go back and find the culprits later on. That really isn't the problem we have. That's where it came from though. We leveraged up. And if you have a 20 percent fall in the value of a 20 trillion dollar asset, that's four trillion dollars. And when four trillion dollars losses land in the wrong part of this economy, it can gum up the whole place.

Charlie Rose: And it continues with respect to the housing market.

Warren Buffett: It continues.

Charlie Rose: Some will argue that we have to do something about that, in terms of the long term recovery of the American economy.

Warren Buffett: There's no question we have an excess stock. The good thing is we have household formation in this country. We have a country where -- I don't know whether it's a million households a year or more, but get formed. So we can eat off an inventory. The inventory is too big and house prices just soared beyond reason in many places. They got financed in silly ways and people lied about loans, all kinds of excesses entered into it. But that is the single biggest cause of why we are here.

Charlie Rose: Should wise people have known better?

Warren Buffett: People always should know better. People don't get -- they don't get smarter about things that get as basic as greed. You can't stand to see your neighbor getting rich. You know you're smarter than he is and he's doing these things and he's getting rich. And your spouse is getting unhappy with you because you aren't doing. Pretty soon, you start doing it. So you get what I call the natural progression, the three I's, the innovators, the imitators and the idiots. Everybody just kind of goes along and you look kind of silly if you disagree. You can have these crazy Internet valuations in the late 1990's, but they proved themselves out in the market. I mean, the next day, they were selling for more than they were the day before. And people said, you're crazy if you don't get in on this. It's very human. Now with housing, it's something even more dramatic than that, because most people aspire to own their own home. If you really think that housing prices are going to go up next year and the year after, you feel, if I don't buy it this year, I'm going to have to buy it next year. That's not true of an Internet stock, but it is true of a home. Then when somebody makes it very easy for you to do it, by saying you don't really have to put up any money or you can lie about your income a little, or we'll give you 100 percent mortgage, you're going to do it, because everybody that's done it has been proven right. It's what they call social proof. And you're going to feel like an idiot if you didn't do it. Next year, the house costs more.

Charlie Rose: It's found money.

Warren Buffett: It's found money for sure.

Charlie Rose: So when you look at where we are going, there seem to be two issues that are apparent, to me at least, risk and leverage. We just lost site of risk and leverage of what was appropriate.

Warren Buffett: People will do it, again, because it pays off for a while. I mean, you can lose leverage and it's the only way a smart guy can go broke basically. If you owe money, you can't pay them off. You just pay for everything and if you do smart things, you eventually get very rich. You can do smart things and use leverage and if you do one wrong thing along the way, it can wipe you out. Anything times zero is zero. It's so reinforcing when the people around you are doing it successfully, you're doing it successfully. And it's a lot like Cinderella at the ball. You know at midnight everything's going to turn to pumpkins and mice. Right? But as the evening goes along, the guys look better all the time, the music sounds better, it's more and more money. Why the hell should I leave at quarter to 12:00? I'll leave at two minutes to 12:00. But the trouble is, there are no clocks on the wall. Everybody thinks they're going to leave at two minutes to 12:00.

Charlie Rose: And you're having a good time.

Warren Buffett: Sure.

Charlie Rose: So, if this plan -- you hope it will do what? It will loosen credit? It will stop the slide and the panic? People will have more confidence?

Warren Buffett: Confidence is key. You're not going to put -- you're not going to leave your money with me unless you're confident I'm going to give it back to you. At this point, when Treasury bills, like seven-day Treasury bills at 1/20th of one percent, it's not because people want to earn 1/20th of one percent. It's because they trust the fact that the Treasury will give it back to them next week. I'm sitting with 6.5 billion dollars we're going to use to close on October 6th. I've got to hand over that 6.5 billion on October 6th. Now I have to be very careful about where I leave it between now and then, because they're expecting me to show up. But I lose confidence in other people, all kinds of institutions. And there are plenty of them that I've lost confidence in. Then they get -- their funds aren't available. They don't have it for the next guy. The whole economy just comes to a grinding halt. Confidence in markets and in

institutions, it's a lot like oxygen. When you have it, you don't even think about it. It's indispensable. You can go years without thinking about. When it's gone for five minutes, it's the only thing you think about. The oxygen has been sucked out of the credit markets and confidence. And there has to be -- it's got to be given a jump start, basically.

Charlie Rose: That's what this is about?

Warren Buffett: That's what I hope gets done.

Charlie Rose: And if it doesn't work?

Warren Buffett: You turn the spigot. But you don't get -- I've argued with the senators and Congressmen I've talked to, you don't want to be too little, too late. Now they're being somewhat too late, in my view. But I'm glad -- but that's OK. We're going to argue for a few weeks after Pearl Harbor to decide whether it was really the Japanese that attacked and whether we should commit a few battleships. But the too little part, it could be a mistake. I mean, this has to be done.

Charlie Rose: Too little, meaning in terms of dramatic steps or the amount of money you're spending?

Warren Buffett: It's whether people think it's too little, when you get all through it. In the end, 700 billion is a lot of money, and it will buy a lot of distressed property. And if you buy them at the right price, you might be buying two trillion of face value. The one thing you don't want to do -- doesn't make any difference what the guy paid for it that you're buying it from, or what is carrying value is. You've got to buy it at market. One way to do that is if some institution wants to sell you a billion dollars worth of mortgages, they might have to sell 100 million in the market, and then you'll buy the other 900 million on the same terms. Now, the very act -- the very fact that this has been authorized or will be authorized, I hope, will firm a up the market to some degree and that's fine. But you don't want to have artificial prices being paid.

Charlie Rose: What do you believe might never be the same?

Warren Buffett: Oh, I think confidence will come back. I will tell you this, this country is going -- will be living better ten years from now than it is now. It will be living better 20 years from now than 10 years from now. The ingredients that made this country, the miracle of the world. We had a seven for one improvement in the average American's standard of living in the 20th century. We had the Great Depression. We had two World Wars. We had the flu epidemic. We had oil shocks. We had all these terrible things happen, but something about the American system unleashed more and more of the potential of human beings over that hundred years, so that we had a seven for one improvement. You have centuries where if you got a one percent improvement, that would have been something. So we've got a great system. And we've got more productive capacity now than we ever had. The American worker's more productive than he's ever been. We've got more people to do it. We've got all the ingredients for a sensational future. It's just right now the athletes on the floor. This is a super athlete.

Charlie Rose: What's the impact of the athlete being on the floor around the globe?

Warren Buffett: Plenty, plenty. We're finding that out. And the same things happen to quite an extent around the globe. The European banks were doing what the American banks were doing.

Charlie Rose: They're failing now.

Warren Buffett: They were getting a mortgage from some guy in Omaha, you know, securitized a couple times. You have all these types from Wall Street. They had advanced degrees and looked very learned.

And they came with these things that said Gamma and Alpha and Sigma. All I can say is beware of geeks bearing formulas.

Charlie Rose: Have we learned something about decoupling or the American economy in terms of its impact? For example, China, a place where you've had investments and you know well.

Warren Buffett: Yes. I just made a new one a couple days ago.

Charlie Rose: What was that?

Warren Buffett: A company called

Byb: Is there an operative narrative to the kinds of investments you're making, other than you look at and you buy on value. You look at management. You look at a place that can absorb the amount of money you want to invest. And you look at its prospects. And you look at price.

Warren Buffett: They have to be pretty good size for us now to move the needle. But we look for fairly large situations. We look for things I can understand. A lot of businesses I don't understand. So some guy may know how to make money in Coco Beans, but I don't. So I just let him have that. It's got to be something I understand. It's got to be a business with fundamentally good economics. There has to be a management that I like, trust and admire. And it's got to be a price that makes sense.

Charlie Rose: Price makes sense.

Warren Buffett: Prices make a lot more sense now, yes

Charlie Rose: Is it --

Warren Buffett: I'm not worried at all about the investments we make. This country, we've got 46,000 or 47,000 dollars of GDP per capita. We've done darn well. We'll do better in the future. I'm not worried about the country. I'm just worried about anything that gums up the potential of the country and right now it's pretty gummed up.

Charlie Rose: OK, but we do this emergency, urgent rescue. Come January, we have a new president. We have a new Treasury secretary. We have a new legislature. What's there imperative? What will be the challenge for them, because they then can take a little bit of a longer term look? Maybe the patient's getting up off the ground, but you want to get him or her moving faster.

Warren Buffett: Well, I think it will get moving faster once -- I mean once you get -- once credit flows. Now, the recession is going to get worse. I mean, I don't want to hold out false hopes that by some magic moment that things will turn around in a couple months, because they won't, Charlie. It's a big mistake trying to mislead people. They will turn around. I don't know whether it will be six months or whether it will be two years.

Charlie Rose: More likely two years than six months.

Warren Buffett: I don't know. It isn't going to be one month or two months, no matter what happens.

Charlie Rose: You can imagine six months from now it's beginning to turn around, with conditions that you know?

Warren Buffett: Those sort of the best case.

Charlie Rose: And the worst case?

Warren Buffett: The worst case is a long time.

Charlie Rose: Five years or --

Warren Buffett: If we don't do the thing we should do, it could be five years.

Charlie Rose: Beyond where we are now, what are those things?

Warren Buffett: I would say this: if it becomes evident that -- I understand the latest bill, they're talking about 350 billion early and then going back. But we need to throw the resources at this. Like I say, we're not spending the money. If we buy these assets intelligently, the United States Treasury will make money. I mean, it's borrowing money. It's just a few percent a year and these assets are better than that.

Charlie Rose: That's a very big if.

Warren Buffett: The treasury secretary.

Charlie Rose: That's the important question, in terms of whether we buy these assets wisely.

Warren Buffett: I would say it's more important who the treasury secretary is than who the vice president is. If you want to have a debate here, I would like to debate between two potential treasury secretaries than the vice presidential candidates.

Charlie Rose: It might be a good thing for the presidential candidates to tell you who it is they're going to be listening to and who might be a potential Treasury secretary.

Warren Buffett: Presidential candidates will tell you they listen to you.

Charlie Rose: I assume they're telling you that, aren't they?

Warren Buffett: It's not their job to narrow the candidacy field. When all these people call you up, what are they asking you? You're hearing from your friends and people at the Fed. You've been through this before too. A lot of other times, you have had to face difficult crises. I've seen a lot of things happen.

Charlie Rose: They come to you and they say, you've fought wars, Warren, we'd like to talk to you. What's the questions they're asking? What is it they want to know? I'm talking about smart people who are charged with fixing it.

Warren Buffett: Well, lately they've been asking will this work.

Charlie Rose: And you're assuring them that if they do it, it will.

Warren Buffett: I said, if they do it -- I don't know who the next Treasury secretary will be. I would say this: I would -- they hate this term in Washington, obviously, but I would hand something pretty close to a blank check to a fellow like Hank Paulson.

Charlie Rose: Would you really? A blank check, 700 billion dollars, go spend it.

Warren Buffett: Yes. Go invest it.

Charlie Rose: Invest it.

Warren Buffett: Put a little of your own money beside it. I might ask Hank to co-invest with me. But no, I think that trying to invest through 535 people is a tough job. So I would give more latitude. That isn't going to happen. I am --

Charlie Rose: Can't you do it with oversight? That's what the Congress is saying, do it with oversight. But don't try to make the decisions yourself.

Warren Buffett: I think oversight is great. And I think that oversight ought to be devoted almost entirely to the question is this being done at market, you know. In other words, you want to make sure that the government isn't investing foolishly, but you don't want to care about which Congressional districts it goes to or whether banks get favored.

Charlie Rose: How do we determine whether it's being done wisely? That's a big question.

Warren Buffett: I think you have plenty scrutiny as how the money's invested. Like the RFC; when the

Rfc Operated: It this different from the Resolution Trust Company because they're talking about securities and not real estate.

Warren Buffett: Resolution Trust Company was set up to liquidate a bunch of assets that the government had inherited because the Savings and Loans went broke. The Savings and Loans went broke, the government stepped in and paid off depositors. Now they're left with this mass of assets to sell. We're not talking about selling here. We're talking about buying intelligently. They're selling what they got handed to them by a bunch of savings and loan operators that, in many cases, had done some very dumb things. But their job was to liquidate. They liquidated it. This is an entirely different proposition.

Charlie Rose: You have said to me before that capitalism is not a perfect system. It may be better than all the other systems, but it's not a perfect system. You've talked about it in terms of some of its failings. People are looking at this now and saying, excesses of capitalism, number one, markets that don't work. And there are certain people in some countries that are pointing their finger at us and saying, see? We told you, that markets was not -- the markets will not always deliver for you.

Warren Buffett: Markets aren't -- people do -- as long as you have markets, you'll have excesses. People went crazy with the tulip bulbs. They went crazy with the South Sea bubble. They went crazy with Internet stocks. They went crazy with the Uranium stocks back when I was first getting started. You're not going to change the human animal, and the human animal doesn't get a lot smarter. You can have institutions that put curbs on that in various ways. Actually with the banks, they have various capital ratios and that sort of thing. But the banks got around them. They set up sieves and that sort of thing just to get more leverage. People love more leverage when it's working. It's so easy to borrow money from a guy -- (CROSS TALK) But if you don't get X plus one back, you still owe the X on the other side. You're in trouble.

Charlie Rose: There is this too, accounting. You have strong feelings about accounting and mark to market. Tell me where you are on that issue.

Warren Buffett: I -- a lot of people disagree with me on this. I believe in mark to market. I think that accounting -- in 1974, Charlie -- it's either 1974 or 1975 -- we owned a bunch of common stocks at Berkshire Hathaway. I told our shareholders what the market was and we used that. I said, I think these things are worth a lot more than market, and we're going to make a lot of money out of it. But this is what they're worth today. I don't think anybody gets hurt by telling the truth on that sort of thing. I think that once you start saying we're going to peg these things at some price that isn't market, god knows what a financial --

Charlie Rose: These people who argue against you will say the assets are worth much more than mark to market says. And therefore, we're not seeing a reality.

Warren Buffett: That's the reality, and that's the reality of what they're going to sell them to the Treasury for too. You get in a lot of trouble when you start putting fictitious numbers on value. You can explain the fact that these are depressed prices, you know, where you think these assets are going to be worth a lot more. And I think that case could be made in certain situations. But I think to just say, you know, we're going to say a dollar of cash is worth two dollars all of a sudden, you know, it isn't worth two dollars; it's worth a dollar today. I think once start putting phony figures into financial statements, you can get into a lot of trouble. We've seen so much of that in the last 20 years.

Charlie Rose: Is it getting worse?

Warren Buffett: I don't think it's getting worse. People want to do is make it get worse.

Charlie Rose: What would reform about that, in terms of the accounting process? You would keep mark to market.

Warren Buffett: The rules get ungodly complicated. It's a nightmare to administer some of this sort of thing. But I want to tell the shareholders of Berkshire, to the extent we own marketable securities or things for which there are markets, even if those markets -- I'm going to tell them what it's all about. As a matter of fact, I have already written a section of the annual report for next year explaining why I think, in one case, that the figures on our balance sheets, as calculated, are wrong. But it's the standard way of doing it. It's holy writ. The

Sec Want Us To Do It That Way: When you look at the prospects for this country, there are other people who argue that America, as good as it is, lives in a world today, and there are books being written, in which our supremacy, our primacy will now have to be shared, that we may still own as much of the pie as we have, but other people own a lot more.

Warren Buffett: That's great. I want our pie to grow all the time, but if some other guy's pie is growing a little faster, that's terrific. It will be good for us in the long run. There are 6.5 billion people in this world. And it's great for 300 million to keep enjoying more and more prosperity. I think it's terrific if the remainder do it. I think if they can learn something from us, in terms of our system, and I think they have, they're learning more about how to unleash the potential of their citizenry to turn out more goods and services that their citizens want or that we want. I think that's terrific. I think it's much better to live in a world where those around you, particularly when some of them have nuclear bombs -- I think it's much better to live in a world where their lives are getting better also.

Charlie Rose: When you look at China today, and you look at some Asian countries, and the amount of America's debt they have, how much does that concern you in today's economic circumstances? And are they losing some of their confidence in America? And does that pose a huge problem for us?

Warren Buffett: Somebody buying these Treasury bills at 1/20th of one percent. We have been consuming about two billion dollars a day of goods and services beyond what we're producing. In other words, the rest of the world sends about two billion dollars a day net of something. We've got to send them something in return, don't we? So we send them little pieces of paper. Now, it would be nice if they stuck them all under a mattress, but they have to buy something with them. Sometimes, they buy our Treasury notes. Sometimes they set up sovereign wealth funds. They can do all kinds of things. They can buy our companies here. As long as we consume more than we produce and we trade away a little piece of the country daily, they're going to own something. Now, on the other hand they can't run from American assets. I mean, every day the rest of the world's going to have about two billion more of American assets than we have, as long as they sell us these goods.

Charlie Rose: We're borrowing two billion dollars a day?

Warren Buffett: Yes, and they want to sell us these goods.

Charlie Rose: You don't believe that's good. You believe that an increasing current accounts deficit is bad.

Warren Buffett: I think it's bad.

Charlie Rose: And it reflects America's consumption ideas, rather than its saving ideas. But how does that change?

Warren Buffett: Well, I laid out kind of a Rube Goldberg plan a few years ago, which I don't like myself, except I like it better than the alternative, which is what we're doing. We've actually been pretty good on exports. We are exporting 12 percent of our GDP now, roughly. That was five percent many years ago of a much smaller GDP. So the rest of the world really likes our stuff pretty well. It's just we buy so much of what they produce. I think that should be something addressed by -- I don't think it's the most pressing problem now at all. We are trading away a little bit of our country all the time for this excess consumption that we have over what we produce. That is not good. I think it's terrible over time. But our country's productive capacity grows enough so we actually can do that and will still be better off. We just won't be as well off if we hadn't done it.

Charlie Rose: What's all this going to do to the price of the dollar?

Warren Buffett: It could be very tough. Inflation could be a very -- is a likely consequence on what's going on. Right now, we're, in effect, making -- to some extent, making a choice between future inflation and getting off the floor. And we're likely to have more inflation in the future as a consequence of the things we do to fight the present situation.

Charlie Rose: Senator Obama, who you support, talks about another stimulus program. Is that essential at this time?

Warren Buffett: I think the biggest thing we need now is to unclog the credit markets. We may need other stimulus. If we do, it should go to the lower and middle income people. The truth is, I have never had it so good in terms of taxes. I am paying the lowest tax rate that I've ever paid in my life. Now that's crazy, you know. If you look at Forbes 400, they are paying a lower rate, counting payroll taxes, than their secretary or whomever around their office, on average. So I think that actually people in my situation should be paying more taxes. I think the rest of the country should be paying less. So then the 95 percent that Obama talks about, or maybe even a little higher than that. But I think that a stimulus plan should really be geared to the people. You've got, what, 24 million households -- one fifth of the households of the United States, you have earning 21,000 dollars a year or less, an average of close to four people or three people in those households, two and-a-half people probably. But just imagine living on 21,000 a year, Charlie, 22,000 a year. You have 20 percent of the population doing that. So they don't worry about guys like me. I would push purchasing power. You push out 1,000 dollars a person to those people, it's going to get spent. And it needs to be spent. They need it. It should come, to some extent, from guys like me.

Charlie Rose: But what about the capital gains tax?

Warren Buffett: The capital gains tax is 15 percent now. So I sit there in my office and I make a lot of money by capital gains and I pay 15 percent, and I pay no payroll tax on it. The woman that comes in to take the waste basket away, she's paying 15.3 or whatever it is on payroll tax alone. I mean, it is -- I never had it so good.

Charlie Rose: So therefore the capital gains tax should be changed to 18, 20, 25, 30?

Warren Buffett: I think it's terrible for people, in effect, to say that income from investments should be taxed at a much lower rate than income from labor. I just think that -- we're going to spend 3.1 trillion or something like that. We only going to raise about 2.6 trillion. You're going to raise it from somebody, you know. Now, who are you going to get it from? You going to get it from me and you, or are you going to get it from the people that drive the taxi that brings me here or whatever it may be? You've got to get it from somebody. And you know, everybody's against paying taxes themselves. I feel the same -- everybody feels that way. If you want a government that's going to do the things we ask our government to do, you've got to get it from somebody. And over the years, the last six or eight years, they've taken less and less from a guy like me. Everybody likes to talk about how the top one percent pays this percent in income. But the income tax is 1.3 trillion. The payroll taxes are over 900 billion. That 900 billion, that doesn't come from me. I mean, I pay it on the first hundred thousand or something like that. But that comes from the people in my office, and they are paying 900 billion. Nobody ever talks about that when they talk about how the one percent is paying. They love to tell how I'm suffering, because one percent, we're paying 25 percent of the total. We're not paying 25 percent of the total taxes on individuals. We're paying maybe 25 percent of the income tax. But the payroll tax is over a third of the receipts to the federal government. They don't take that from me on capital gains. They don't take that from me on dividends. They take that from the woman who comes in and takes the waste baskets out.

Charlie Rose: You mentioned inflation, possibilities of inflation; are you therefore -- do you have a position on what interest rates -- what the Fed should do about interest rates?

Warren Buffett: I think that's almost -- for the time being, that's just put it -- yes, just put that aside and we'll get to that after the patient's up and walking. It's interesting though. I mean, what's going to happen -- things we're doing are going to have some inflationary consequences. But you see interest rates at very low levels, including the long rates.

Charlie Rose: When we watch this -- you and I are having this conversation today. The Senate votes tonight. House may vote -- people I talk to today believes it's going to pass. Whatever happened that changed minds. Either a combination of what they did with the plan and tweaking the plan, or B, some people got so scared by the failure of the vote last time that it brought home the danger of not doing anything. All right, how will we measure the progress, whether this is working or not?

Warren Buffett: It's going to be tough because the economy's going to be getting worse for a while. It might fall off a cliff, if this doesn't pass, but nobody will ever know that if it passes. So they will not see immediate reaction. We'll be pounding on that guy's chest on the floor. And, you know, he's not going to just jump up all of a sudden. So it makes it tough. I mean it's tough to be in the legislature and vote for something and then people say, well, you voted all this money and it's all getting spent. It's not being spent, it's getting invested. But it's all getting spent, nothing happening, how can you have done that; you haven't done anything for me. You go through all of that. That's going to be tough. What it really takes is leadership that knows what it's all about and can explain what it's all about.

Charlie Rose: Hasn't that been missing though, leadership that can explain what it's all about.

Warren Buffett: Absolutely.

Charlie Rose: The reason you're here and the reason I want to have a fire side chat with you is that somehow it hasn't gotten through.

Warren Buffett: When the president of the United States goes out at 8:00 in the morning and his own party votes against him two to one in the House, you know a message is not getting out. It takes real leadership. I mean, Roosevelt didn't -- when he came in, he didn't print any money. Actually, he may have done a little bit of that. But it wasn't like you've gotten the greatest economics professor in the world or anything else. But he did restore confidence. And they did a lot of that. And you needed it. You needed to jump start the economy. It took a long time. The world did not change in 1933 or 1934. But we put in things like the FDIC. I think the FDIC was one of the great inventions of the American economy.

Charlie Rose: They had to tweak that in terms of this bill, did they not?

Warren Buffett: They're going the right direction, yes.

Charlie Rose: Roosevelt also said, the only thing we have to fear is fear itself, which is clearly the fear that exists in the country. Tell me when you worry the most, of all the things that you have seen over the last three weeks, say, in the last month. When did you say, my god, I never knew it could get to this point?

Warren Buffett: Well, I don't get that afraid in a sense, because I really do have faith. I know the country works extremely well. But when it isn't clogged up. And I know that Congress will do the right thing. When I watched the House vote the other way, I wasn't afraid because I still felt something would pass. But we are going through a very, very tough period. And I did not think I would see the day when AIG would not be able to have their checks cleared.

Charlie Rose: If

AIG Had Failed: Everybody would have been exposed, Charlie, everybody.

Charlie Rose: Why was there even a question of not rescuing AIG at that time?

Warren Buffett: I think people that understood it, they probably -- they were hoping the private sector would do it. That's the same way I would behave. If I were the treasury secretary or head of the Fed, I would try to scare the hell out of the private sector and say, you better save this, because you're going down with the ship. You guys save it. And I would wait as long as I could. If they didn't save it, I'd come in.

Charlie Rose: Did that, in fact, happen during this crisis, in which the Treasury secretary said, you better save this or we're all going down. You better put up some cash right now.

Warren Buffett: I think they hoped the private sector would come in. And the private sector tried to come in until they saw the size of the problem. There were people on that weekend that thought they had a solution. And then the whole kept getting bigger and bigger. And all of a sudden, it became apparent that 20 billion wouldn't do it and 30 billion wouldn't do it and 40 billion wouldn't do it. It got beyond anybody's ability to certainly to do it in a short period of time.

Charlie Rose: There was not enough capital available from the government?

Warren Buffett: It's an unknown situation. You have a derivative book called AIG financial products. Nobody's ever heard of it, except it was terrific profit center. You could manufacture earnings and do all these things. And I will guarantee you that the top management -- and I'm not knocking them for this. They couldn't get their mind around it. I bought a company called General Reinsurance in 1988 that had a similar but much smaller operation, had 23,000 contracts. I said, I have to get out of this. It cost me 400

and some million dollars in a benign situation. But this was not a benign situation. If AIG Had Tried To Unwind The Derivative Book: And there was no private capital to come in and do that.

Warren Buffett: Not big enough.

Charlie Rose: Not eve Berkshire?

Warren Buffett: Not eve Berkshire Hathaway. If I thought five or 10 billion would have bought me a good deal, I'd have done it.

Charlie Rose: Ten billion was within reach, but 85 billion might not have been.

Warren Buffett: And the Feds structured that thing very, very well. I mean they have put themselves in a position where they are very likely to get their money back, maybe more. They participate 80 percent. They drove tough terms. I mean, I want to hire the guy that made that deal. He would fit in well at Berkshire.

Charlie Rose: A lot of people look at you and Goldman Sachs and

Ge: Tim Geitner did a better job on this one.

Charlie Rose: So we've come down to the close of this conversation. You have been warning us about certain kinds of things. I hear from this conversation too, this plan is essential now, otherwise we're in a very very difficult place, and each week we go beyond not doing something, we get deeper and it becomes more irreversible.

Warren Buffett: Yes. Whoever said, you know, an ounce of prevention is worth a pound of cure understated it. A pound of cure is delayed another six months, you need a ton of cure later on. I mean, it would be crazy not to do this. It will not produce dramatic results, though, in the economy. That's what people have to understand. You're going to see unemployment go up. You're going to see lousy earnings in many businesses.

Charlie Rose: You're going to see people unemployed.

Warren Buffett: You're going to see more people unemployed. But the difference, Charlie, if we bottom this thing out at seven percent unemployed versus nine percent, that's three million people. That's three million people that, if we do it wrong, you know, lose their jobs unnecessarily, in my view. You know, I have never been unemployed. I have never been very fully employed either. But just think of what it's like to go home with a mortgage payment and kids and everything else. My dad had that happen to hi in the early 30's. You don't want to create three million people more -- unnecessarily. But I don't think --

Charlie Rose: That's the depression.

Warren Buffett: You can't help some increase from this point. I don't want any viewer to go away thinking a magic wand exists in Congress. So they're going to see some more bad news. But if we do this, we're doing the right thing. The system will work over time. We've got a wonderful system.

Charlie Rose: Let me come to that in the end. Do we need to do anything beyond the system, beyond the urgency of the moment, come January, about the system? Lots of talk about regulation, as you know, and finding the right balance. Lots of talk about whether government involvement is an idea we need more of rather than less of, rethinking sort of what President Reagan brought to fore.

Warren Buffett: Once we get the athlete back, we can tell him to change his diet a little or exercise a little more. We can do all of that sort of things. If I have any good ideas out of that, or I think they're good ideas, I'll be glad to contribute them. But the system will probably overdue some other things. The nature of democracy is such that when there's this revulsion towards -- that's never going to happen again. So we will probably attack it in various ways that don't make sense. But I'm -- that's what Congress is for and that's what advisers are for. I'm all for getting the best minds to get to work on that kind of thing. I don't think it will be done perfectly. Maybe we'll end up with a little bit better system at the end. We had a pretty good system over time. When we went crazy, and we did go crazy on residential real estate, it set things in motion that just -- the dominoes started toppling.

Charlie Rose: Thank you for coming.

Warren Buffett: Thank you, Charlie. Enjoyed it.

Charlie Rose: Good to see you. Warren Buffett. We're in San Diego. My thanks to the people at KPBS here. A conversation here about the crisis that we all face and hearing from a man that a lot of people want to hear from. And I'm pleased we were able to join with him here. Thank you for joining us.

Warren Buffett (2009)

11/13/2009

CHARLIE ROSE: Warren Buffett is here. As you know, he is perhaps the world's most respected investor. He's also chairman and CEO of Berkshire Hathaway. He has been on this program many times. I last spoke with him over a year ago at the peak of the worst economic crisis since the Great Depression. At that time, he said that America had been struck by an economic Pearl Harbor, but much has changed since then, and he's here to tell us how he views a global and American economy in recovery. His own company reflects the progress made in recent months. Last week, Berkshire Hathaway struck a \$26 billion deal to buy all of Burlington Northern Santa Fe railroad, the largest acquisition in company history. He called the deal an all-in wager on the American economy. He is in New York for a town hall event that he held with Bill Gates at Columbia University yesterday. He graciously agreed to stay over in New York an extra night, and I am pleased to have a good friend of this program and a good friend of mine back at this table. Welcome.

WARREN BUFFETT: Thank you, Charlie. Pleased to be here.

CHARLIE ROSE: Great to see you. It has been, certainly from the middle of 2008 to the middle of 2009, one incredible year.

WARREN BUFFETT: One incredible year. One to a lifetime, I hope.

CHARLIE ROSE: Yes. Tell me about it for you.

WARREN BUFFETT: Well, it was-- it really was an extraordinary time in this country. We came closer to a financial meltdown than certainly any time I have ever seen, and probably in certain respects even -- there was even more panic than the Great Depression, because it came on so fast and so unexpected. And the whole country wanted to deleverage, corporations, individuals, and fortunately we had a government that responded. It was -- when we talked last, it was a little question of whether Congress would respond like they should. They finally did, and I -- I felt they would in the end. I mean, in the end, they come together for things that are this vital to the country. But we had the right people in Washington. If we'd had a group that behaved like a deer in the headlines, that deer would have gotten run over.

CHARLIE ROSE: So Paulson and Bernanke and Geithner were the right people at the right time, and you don't know what might have happened if others had been in those positions of power.

WARREN BUFFETT: I can think of others-- I'm not going to name them-- but I can think of others where the ending would have been with us in the abyss rather than just peering down into it.

CHARLIE ROSE: You made some investments during that period.

WARREN BUFFETT: Right.

CHARLIE ROSE: General Electric, Goldman Sachs.

WARREN BUFFETT: Goldman Sachs.

CHARLIE ROSE: But you just pulled out the big elephant gun.

WARREN BUFFETT: Well, we may have used most of our powder on that one. (LAUGHTER)

CHARLIE ROSE: You said I stretched to the last nickel for this one.

WARREN BUFFETT: Yes.

CHARLIE ROSE: Why did you do it?

WARREN BUFFETT: Well, I felt it was an opportunity to buy a business that is going to be around for 100 or 200 years, that's interwoven with the American economy in a way that if the American economy prospers, the business will prosper. It is the most efficient way of moving goods in the country. It is the most environmentally friendly way of moving goods, and both those things are going to be very important. But the biggest thing is the United States is going to do well. I mean, we can't move the railroad to China or India. They haven't figured out how to do that. So you know, it's sort of like if you remember that song about New York-- we have to make it here or we can't make it anywhere.

CHARLIE ROSE: Frank Sinatra. (LAUGHTER)

WARREN BUFFETT: But it does move 400 -- it moves a ton of goods 470 miles on one gallon of diesel. It replaces -- a train replaces 280 trucks on the road. It emits far less into the atmosphere that's damaging than trucking, and it moves-- I'm talking about the whole rail industry-- it moves 40 percent of the goods.

CHARLIE ROSE: And you have new ports of entry like Houston that are bringing a lot of goods...

WARREN BUFFETT: Oh, sure.

CHARLIE ROSE: ... through the Panama Canal.

WARREN BUFFETT: And we're going to have more people in this country and they're going to be using more goods over time. And sure, there's a bad year from time to time. In the next 100 years, there will probably be 15 bad years, and I don't know what order they'll appear, but I also know the railroads will be essential to the country.

CHARLIE ROSE: Now, when you called Charlie Munger and said I'm thinking about this, did he say right on, Warren? Or did he say, how about this?

WARREN BUFFETT: Well, if Charlie said "right on, Warren," I would figure I had the wrong number. No, that would be a wrong number.

CHARLIE ROSE: That's not the likely reply.

WARREN BUFFETT: That might be my wife or my, you know -- but Charlie gave kind of a low-level grumble, and that is a real endorsement from Charlie.

CHARLIE ROSE: But I mean, he also pointed out, it is said, that, you know, there was-- this was a regulated industry.

WARREN BUFFETT: Sure.

CHARLIE ROSE: This was an industry that was capital-intensive.

WARREN BUFFETT: Very capital-intensive.

CHARLIE ROSE: This was an industry...

WARREN BUFFETT: You spend money...

CHARLIE ROSE: That was unionized.

WARREN BUFFETT: It was unionized. You spend money in this business regularly every day. You're spending a lot of money to repair track, add rolling stock, whatever it may be. So it's capital-intensive, and it is regulated, and it will continue to be regulated, and it will continue to be capital-intensive. I think that what the service provided by railroads is so important in many ways. I mean, it's the right way to move goods around the country to the extent that you can do it. And it's far, far more attractive in terms of global warming than using trucks, for example. So it will be here, and if we get a reasonable return on the added capital investment-- because it will take added capital investment-- we'll do OK.

CHARLIE ROSE: Reasonable return is good enough?

WARREN BUFFETT: Reasonable return is good enough, Charlie. I mean, 50 years ago, I was looking for spectacular returns, but I can't-- I can't get them. We have-- we have eight or \$10 billion to invest every year. And we're in the utility business, and it's the same thing there. When we build electric generation or something of the sort, we shouldn't expect a spectacular return. We're building things that are essential to society, and people need our services. They really don't have any choice in the case of the electric utilities, for example, and sometimes in case of rail. And we should get a decent return on that. Enough to encourage us to keep putting money into the business, but we're not entitled to spectacular returns.

CHARLIE ROSE: You carry coal?

WARREN BUFFETT: Well, that's a big one in terms of tonnage, yes.

CHARLIE ROSE: And if, in fact, we wean ourselves off coal, is that a big problem?

WARREN BUFFETT: Well, we will wean ourselves off coal over time. We can't change 40 percent of electric generation that goes-- that comes from coal. We can't change that next week or next month or next year, but we will reduce it over times, and we should reduce it over time.

CHARLIE ROSE: And you can add other things to carry and changes will be...

WARREN BUFFETT: There will be more grain to move, and there will be more all kinds -- chemicals-- or whatever it may be. There will be more things moving around this country 10 or 20 or 30 years from now.

CHARLIE ROSE: Knowing your idea about moats, is it a pleasing idea that no one is likely to get into the railroad business?

WARREN BUFFETT: If they wanted to reproduce the Burlington Northern Santa Fe, it might take \$100 billion or so.

CHARLIE ROSE: And 100 billion years.

WARREN BUFFETT: They'd have to be a real sport. (LAUGHTER)

CHARLIE ROSE: And they are also modernized today, are they not?

WARREN BUFFETT: Enormously. Enormously. The railroads-- take a railroad like BNSF. They're moving far more ton miles of product with less in the way of people, less in the way of fuel. Railroads have become far more efficient over the years. There were a million and a half people employed in the

rail industry after World War II. Now there are about-- less than 200,000 in the United States, and they're moving far more goods. So it's really become efficient. You watch those 130-unit trains double stacked...

CHARLIE ROSE: You had other railroad companies in your portfolio.

WARREN BUFFETT: Right.

CHARLIE ROSE: You're selling them?

WARREN BUFFETT: I've already sold them. Yes. I've done that just to facilitate the transaction. I think they're good investments, but I would have held them if this hadn't happened.

CHARLIE ROSE: When you look at the future, there's also the argument made that this is something that goes with your philosophy today-- get out of cash and get into assets. Because we don't know what's going to happen to the dollar.

WARREN BUFFETT: Well, cash is always a bad investment. I mean, when people say cash is king a year ago, I mean that's crazy. I mean, cash wasn't producing anything, and it was sure to go down in value over time. And then you always want to be sure you have enough. It's like -- like oxygen -- you want to be sure it's around, you know. But you don't need to have -- you don't need to have excessive amounts of it around. And cash, we will always have enough cash around.

CHARLIE ROSE: Yes.

WARREN BUFFETT: But anytime we have surplus cash around, I'm unhappy. I mean, I would much rather have good businesses than cash. And we found a chance in the last year, thereabouts, to deploy -- we came in with something over \$40 billion in cash ...

CHARLIE ROSE: Right.

WARREN BUFFETT: ... and we have got about \$20 billion now, and we've had some earnings. So, we -- we've put a lot of cash to work. And I like that. No, I'd much rather own a good business than have cash.

CHARLIE ROSE: And it is a hedge against the dollar?

WARREN BUFFETT: Well, you can say all assets are a hedge against the dollar. I mean, but -- all you know is that the dollar is going to be worth less 10, 20, 30 years from now. I say "worth less." Not worthless.

CHARLIE ROSE: Right. (LAUGHTER)

WARREN BUFFETT: You want to watch that. But it will be -- you know, and that's true of almost every currency that I can think of. The question is how much it depreciates in value. But cash -- cash is not a place...

CHARLIE ROSE: Now, why is that?

WARREN BUFFETT: Well, because ...

CHARLIE ROSE: ... that the dollar is going to be worth less?

WARREN BUFFETT: Because we'll print more of them in relation to the amount of goods that are moving. You know, if we dropped -- if we dropped a million dollars of cash into every household in the

United States today, everybody would feel very good except the people that invested in things that were denominated in dollars. You know ...

CHARLIE ROSE: Exactly. Got it.

WARREN BUFFETT: There will be no tendency toward deflation in this country over time or -- or virtually ...

CHARLIE ROSE: A tendency towards inflation.

WARREN BUFFETT: Absolutely.

CHARLIE ROSE: OK.

CHARLIE ROSE: In all the conversations we've had, I never thought that I would sit with you and we would talk about a 50:1 split of a class B stock.

WARREN BUFFETT: Right. Right.

CHARLIE ROSE: I mean, this had to be a hard one or not?

WARREN BUFFETT: I think I had a lobotomy one night and I didn't know about it. It is -- it is not -- it is not natural for me, but it was needed to facilitate the small shareholders of BNSF getting the same deal as the big shareholders.

CHARLIE ROSE: Right. Right. Right. Will it also qualify you for the S&P index?

WARREN BUFFETT: Well, it probably makes it a little less -- a little more likely over time that we get in there (ph). It makes it easier for S&P, because we're by far the largest company that's not in the index ...

CHARLIE ROSE: Yeah.

WARREN BUFFETT: ... and -- and we'll probably-- my guess is that they'll consider us for it.

CHARLIE ROSE: And you'd like that?

WARREN BUFFETT: I certainly wouldn't mind it. But I don't -- but I don't -- I mean, it's not -- it's not on my wish list for Christmas.

CHARLIE ROSE: It is not on your high lust list.

WARREN BUFFETT: No, no, no. The big thing is what happens to the value of the company. And the shares will take care of themselves if we build value.

CHARLIE ROSE: Yeah. When you -- when you look at the railroad business, it has a romance to it. You had a railroad track, I guess, in your attic, didn't you or some ...

WARREN BUFFETT: I still do. I still do. I hope they don't make me sell it for antitrust reasons.
(LAUGHTER)

CHARLIE ROSE: Take a look at this tape. (VIDEO CLIP)

WARREN BUFFETT: My heart's beating faster after watching that. Throw in Grace Kelly or Marilyn Monroe and I would have paid more. (LAUGHTER)

CHARLIE ROSE: J.P. Morgan also owned the railroads, didn't he?

WARREN BUFFETT: Yeah, and he was -- he ... (CROSSTALK)

WARREN BUFFETT: In fact, there was a huge fight over the Northern Pacific ...

CHARLIE ROSE: Right.

WARREN BUFFETT: ... which is one of the predecessor roads. And -- and you had -- you had two factions, and Morgan was lined up on one side. Yeah, he was -- he was very involved.

CHARLIE ROSE: Last night at Columbia, you said that the economic panic is over.

WARREN BUFFETT: Yes.

CHARLIE ROSE: Where do you think we are?

WARREN BUFFETT: Well, I can tell you where we are today. I can't tell you, you know, what's going to happen tomorrow. But we've got 70-some businesses -- so I get a lot of -- the panic is over. I mean, now money's flowing. I mean, because we're in a recession, there's not as much demand for money, and money isn't flowing to really dumb projects like it was a few years ago, but money is available now. And the panic is gone, and credit defaults spreads have come down dramatically. But that panic that spilled over into the real economy last fall, really, has -- it's left -- it's left real scars on the American public psyche. I mean, the reset of how they spend their money and how they're thinking about their future changed in a big way last fall, and that -- that has not come back. And so in our businesses, they've bottomed. But they're not -- there are very few upticks. It's more or less flat right now. But it will come back, Charlie. I want to emphasize that. But it has not changed much since so far.

CHARLIE ROSE: Do you have any sense of timing about that?

WARREN BUFFETT: I really don't. I mean, you know, it -- I keep watching, and it will come back. And people are not panicked anymore, but they're behaving differently than they did a year ago.

CHARLIE ROSE: Saving more, taking less risk.

WARREN BUFFETT: They're taking less risk, and they're more worried about ...

CHARLIE ROSE: Budgeting better.

WARREN BUFFETT: They're worried about their future, more people are. You know, they have -- they have seen something happen that they didn't -- wasn't really in their -- in the scope of what they thought was possible.

CHARLIE ROSE: You have said for a long time that we are too much of a consuming society, not enough of a saving society. Will we now become a saving society?

WARREN BUFFETT: Yeah, we'll probably become a saving society, but of course the government demands for borrowing will be such that even with a lot of borrowing from abroad, there will be a lot of borrowing required from within the country.

CHARLIE ROSE: And where is the consumer demand going to come from?

WARREN BUFFETT: Well, it will come back eventually. I mean, we -- you know, our system will still work. But we have -- you know, we talked last year about the patient, you know, being on the floor with a cardiac arrest ...

CHARLIE ROSE: Yeah. Right.

WARREN BUFFETT: ... and we're not out of the hospital yet. But we will come out of the hospital. This -- the things that made America what it is have not disappeared, and they will -- they will assert themselves with time. But if you have way too many houses, you know, it's going to take time to work that off. If you've got a commercial real estate problem where people just borrowed too much money and bought in at too low cap rates and all of that, that does take time to work off. That's happened to us in the past, though, too. It happened in the 19th century, it happened in the 20th century at various times, and we've always come back stronger.

CHARLIE ROSE: Commercial real estate is really in trouble.

WARREN BUFFETT: It's a mess.

CHARLIE ROSE: You're in the underwear business, you're in the ice cream business. You're also in utilities.

WARREN BUFFETT: Right.

CHARLIE ROSE: There was even a depreciation in demand on the part of -- for electricity?

WARREN BUFFETT: It's amazing. We're -- in both Iowa, Midwest, and then we also have the Pacific Northwest and the mountain states, and everywhere you expected to see a big drop in industrial demand, but if you take weather-adjusted behavior of residential customers, it fell off. And it was like nothing we've seen since World War II. You know, it doesn't mean that it goes down 20 percent in residential or anything, but this was an absolutely different experience than anything we've seen since World War II in residential usage.

CHARLIE ROSE: Is one of the things that is going to come out of this crisis, that the demand for products, somebody else is going to have to shoulder that demand, create that demand, other than the American economy?

WARREN BUFFETT: No, the American -- the American economy will come back. It won't be tomorrow, and, you know, it won't be exactly the same. But in the end, we have not -- we've not changed the American people in their capacity to innovate or their excitement about -- about becoming more prosperous, and coming up with new ideas. There are -- businesses will be formed. Businesses will expand. But not much tomorrow.

CHARLIE ROSE: You have said we may need more medicine. Meaning more stimulus? More what?

WARREN BUFFETT: No, we had a lot of medicine, and we're going to have a lot of after-effects from the medicine.

CHARLIE ROSE: We'll talk about that in a minute. Yes.

WARREN BUFFETT: Yes, but they -- the stimulus was not perfectly executed. Nothing's perfectly executed, I mean. I shouldn't be criticizing. But ...

CHARLIE ROSE: Why shouldn't you be criticizing? Don't we learn from that? I mean ...

WARREN BUFFETT: Well, oh, yeah, no, but I mean, overall, if they get the job done, I don't believe in picking too much at given -- given actions. But, you know, there should have been more infrastructure in there, and they hung a Christmas tree under it -- as I said, sort of like mixing half a tablet of Viagra with candy. I mean, it would have been better to leave out the candy and have the full take -- full dose of Viagra. (LAUGHTER)

CHARLIE ROSE: But do you think we need a new stimulus, and because the other one -- the previous one, the only one was flawed?

WARREN BUFFETT: No, I think we can reserve judgment on that. I think just the holiday season will tell us something when it comes. And I would say that so far from what I've seen, you know, I don't think it's going to be that big of a holiday season, but we'll know -- we'll know that in a month. best place to invest your money.

WARREN BUFFETT: Absolutely.

CHARLIE ROSE: In terms of American companies, in terms of everything.

WARREN BUFFETT: Everything. You know, if you look back a couple of hundred years, we've gotten where we are not because we've gotten smarter or not because we work harder. We've got it because we found ways to unleash more of the human potential. And what does that? Well, a rule of law helps. A market system helps. Equality of opportunity helps. All of these things that are still a fundamental part of the American system. As a matter of fact, the American system is now better than it was a couple of hundred years ago, because until the 19th Amendment, you know, we've had half the talent in the United States that wasn't entitled to do much. So we've got a great system.

CHARLIE ROSE: But what's happened is that the rest of the world, especially China and India and places like that, have grown and have enormous potential now and that are growing faster than we are.

WARREN BUFFETT: That's terrific.

CHARLIE ROSE: That's terrific? It means the pie's bigger?

WARREN BUFFETT: Sure. The world is not a zero-sum game. I mean, if we had our choice of being an island of prosperity in a world of 6.5 billion people, most of whom were struggling, or being the same country with other people prospering, the latter is much the better choice, particularly in the nuclear world. You do not want -- you don't want billions of people with nuclear capacity ...

CHARLIE ROSE: Right. Right. Right.

WARREN BUFFETT: ... envying you and feeling that somehow you've gotten all the goodies of the world. So, we will grow slower relative to a China, significantly slower, but they're starting from much of lower base.

CHARLIE ROSE: But at some point, mid-century, they'll have a larger economy than we will.

WARREN BUFFETT: It's going to be a long time.

CHARLIE ROSE: You don't believe that, though?

WARREN BUFFETT: Well, larger on a per-capita basis is a long way . . .

CHARLIE ROSE: I don't mean per capita, but a larger growth economy.

WARREN BUFFETT: That's true.

CHARLIE ROSE: They'll have a larger growth domestic product than we will.

WARREN BUFFETT: They have four times as many people as we have, they're going to -- they will have a larger overall economy. You know, they will grow faster than we will grow, but they're starting from a much lower base. I mean, you know, I'll meet some guy in the street today whose net worth will be growing faster than mine on a percentage basis, but if I start with a big enough number, it will be a while before they catch me.

CHARLIE ROSE: Oh, yes. This is also different for China. They now, you know, have certainly -- you are invested in a Chinese automotive and battery company ...

WARREN BUFFETT: Right.

CHARLIE ROSE: ... of which the founder, a 43-year-old entrepreneur, is somebody that you would admire wherever he was from.

WARREN BUFFETT: That's right. And some of the things ...

CHARLIE ROSE: And he has a bit of you in him.

WARREN BUFFETT: Well, yeah. He speaks Chinese, I don't. Yeah. That fellow is probably going to do remarkable things.

CHARLIE ROSE: He's the richest man in China now.

WARREN BUFFETT: That's right. But I think if he does remarkable things, that's going to be good for the United States. I mean, if he develops better battery technology, we will get it, believe me.

CHARLIE ROSE: OK, but there's the question that has been raised. In the past the United States has always been on the cutting edge of technology. Your great friend Bill Gates is testament to that.

WARREN BUFFETT: Sure.

CHARLIE ROSE: But are they developing the capacity -- he's going to lead in batteries. Somewhere else they say China is going to lead in solar technology. Somewhere else say, they do more -- is this ...

WARREN BUFFETT: Well, we don't know...

CHARLIE ROSE: Are we looking at that hard reality?

WARREN BUFFETT: Well, it's better to have the whole world, the talent of the whole world working on things like battery technology or whatever it may be. I mean, I'd like -- you know if we're going to add the resources of a whole bunch of other people to help solve our problems, I'm all for it. If we get there first and they copy us, fine. If we get there first and we copy them, fine. I mean, it is not like they're going to be able to horde the technology and we'll never see it. So, you know, I'd like to see -- I'd like to see the United States come in first on everything, but I don't -- I don't think it will be terrible if somebody in China or India comes up with something that enables this country to deal with its problems. We'll get the technology.

CHARLIE ROSE: It may very well be that this -- the world will be waking up. I saw today that President Medvedev basically said in a sort of stern message to the Russians, that we can't just depend on the export

of oil and energy. We have to begin to think about how we restructure -- all the things -- sounding like an American ...

WARREN BUFFETT: Yes.

CHARLIE ROSE: ... speaking about the economic reality of today.

WARREN BUFFETT: And the reason he's saying that, it is because it's so darn obvious. I mean, you know, they did count on oil. They've been counting on it too much. And -- but the beauty of it is, you know, we don't have a monopoly on the system. I mean, we can -- a market system can exist elsewhere. And that does cause people to work on things that other people want. I mean, you know, it's much better than having a central planner.

CHARLIE ROSE: When you look at today and what we face in terms of the job reality, are we going to have the capacity to create the kind of jobs or will we have to settle at a new unemployment rate that we're not familiar with?

WARREN BUFFETT: No. We'll create new jobs. I mean, we've been through all kinds of tough unemployment cycles. In the early '80s being probably the toughest. It really looked tougher for the -- not in the financial world. But in 1981, 1982, you know, we were at 10 percent unemployment, and Volcker was applying, you know, a battle axe to the economy, and people said, you know, Germany and Japan are going to produce everything, what will happen to this country. We've created millions and millions and millions of jobs since then. But, you know, who would have thought when Paul Allen and Bill Gates were in Albuquerque, you know, eating pizza and drinking coke at 2:00 in the morning, you know, that they were a big part of our future. But that's going on right now. I mean, who would have thought the Google guys were doing what they were doing, you know, a few years back? We have -- we can't predict what it will be. I sat there in that room in Columbia last night with 1,000 people. If we'd had that same 1,000 people back in 1790 and I gave them some pep talk like this and they'd leave the place and they'd all go back to their farms and say, that's fine, but, you know, what the hell are we going to do, you know. If farm implements get better, well, there is no jobs. But they wouldn't have been thinking about the automobile and the airplane and the electric -- all of that. I can't tell you what it will be, but I can tell you it will happen.

CHARLIE ROSE: You have also said and been very clear that you think in this conversation and every other one, you know, that we had to pour a lot of money at a crisis, and we may very well have presented ourselves with a problem that is as difficult as the crisis.

WARREN BUFFETT: Well, when you -- when you use old medicines in unprecedented dosages, and even invent some new medicines as we had to do last fall -- you know, there are side effects and after-effects. And probably they're somewhat proportional in certain ways to the extreme nature of the dosages. So, you know, we cannot keep running fiscal deficits like we are currently without having a lot of consequences over time. And ...

CHARLIE ROSE: \$1.4 trillion for 2009.

WARREN BUFFETT: Yeah, a lot -- you know, that's just, you know, even for a guy like me, I mean ...

CHARLIE ROSE: Those are real numbers.

WARREN BUFFETT: Trillion gets my attention. So, you know, that has consequences. And we are not saving \$1.4 trillion to finance that deficit. And we faced huge deficits in World War II. I mean, relative to GDP then, to fight a war, and there were inflationary consequences after, even a little bit during the war.

CHARLIE ROSE: So inflation will be inevitable because of the amount of money we ... (CROSSTALK)

WARREN BUFFETT: And then the question is whether -- and basically, it's Congress. I mean in the end, Congress is the one that determines the value of the dollar over time. They -- if they follow policies that require us printing too much of it, monetizing debt and all of that sort of thing, dollars -- dollars will become worth a lot less.

CHARLIE ROSE: So Congress has to do what?

WARREN BUFFETT: They -- they have to, once the economy is rolling again, they've got to -- they've got to apply some, you know, they've got to raise taxes now that income will go up as the recession ends anyway, but they're going to have to -- they're going to have to close the gap between expenditures.

CHARLIE ROSE: They've got to find more revenues.

WARREN BUFFETT: They've got to ...

CHARLIE ROSE: The expenditures is a harder thing to do than the -- finding the revenues. Isn't it?

WARREN BUFFETT: Yes.

CHARLIE ROSE: I mean -- go ahead, tell me. Which is easier, cutting expenditures or raising the revenues?

WARREN BUFFETT: They have got to do one of the two, because the gap between the two, you know, is as wide as the percentage of GDP -- is wider as a percentage of GDP than we've ever seen except in wartime.

CHARLIE ROSE: It's now what, ten percent?

WARREN BUFFETT: Yes. That's exactly. Just a touch over ten percent is the gap. And that's huge.

CHARLIE ROSE: And what's acceptable? Six?

WARREN BUFFETT: Well ...

CHARLIE ROSE: It was six during Reagan. It was six ...

WARREN BUFFETT: We can work -- if we have a gap of about 2, 2.5 percent and we have sort of normal growth, then debt as a percentage of GDP doesn't grow. So, the country gets more valuable over time and we have more productive capacity, and all. So we can handle more debt, but it should not be -- it should be proportional to, in a sense, the wealth and earnings of the country. And -- and we can take a couple of percent gap over time, and have that debt not grow proportionally.

CHARLIE ROSE: Right.

WARREN BUFFETT: It's about -- the net outstanding is about 55 percent of GDP now. There's nothing wrong with that. But you don't want to just keep climbing. And at a point it gets out of control and interest on debt compounds and all of that sort of thing. But of course, in good years, if you're going to average 2 percent, you'd better not have 2 percent be the base, because you'll get into years like this with ten percent, and it will pull the average up a lot.

CHARLIE ROSE: This question is asked frequently. Will at some point the deficit and the debt and the decline of the dollar get to a point that people who hold our debt will no longer want to buy and then we're in a crisis?

WARREN BUFFETT: Well, the rest of the world doesn't have much choice, in a sense. I mean, if we -- if our current account surplus -- deficit, is \$400 billion, we're handing \$400 billion to the rest of the world. They've got to buy something with it, and one way or another they have to buy something in dollars. I mean, if they get those dollars and they buy government bonds of the United States and they decide to sell them to buy stocks, you know, they still get dollars when they sell the government bonds. They can -- they can choose among assets. They can't really choose not to invest in the United States.

CHARLIE ROSE: But they can choose as to where else they go for new investments, can they not?

WARREN BUFFETT: Well, they -- in effect, if we're running a \$400 billion deficit figure, the rest of the world is getting \$400 billion worth of I.O.U.'s of one sort or another from the United States.

CHARLIE ROSE: Right. Right.

WARREN BUFFETT: Now, if they invest that in France -- because some say the Chinese buy stuff from France -- now France has got the dollars. The only way you can bring down that is to actually get rid of the current account deficit over time. And -- but in any event ...

CHARLIE ROSE: And that's having to do with the costs and savings, the consumption savings rate.

WARREN BUFFETT: But if you are running a \$1.4 trillion deficit, even if you are exporting \$400 billion of I.O.U.'s in effect to the rest of the world, that leaves another trillion. And, you know, the domestic savers are not going to come up with a trillion. I mean, so these numbers are unsustainable over time, what we're doing. It is true, though, that if you keep flooding the world with your debt and people see your fiscal policies are sort of out of control, they're going to get less and less and less enthused about your debt, and then one of two things happen. Either you keep paying more and more to roll over that debt or you start monetizing it like crazy. And I mean, the Federal Reserve can buy the debt and issue -- issue currency for it, but then the currency gets worth less.

CHARLIE ROSE: But is what you just described the reality we're facing if we don't do something dramatic soon?

WARREN BUFFETT: Fairly soon. And we still want the economy to come back. I mean, we want to put out the fire. You know, but then make sure ...

CHARLIE ROSE: You worry about that later after we put out that fire.

WARREN BUFFETT: Then we don't -- (inaudible) just squirting water on those buildings. We have to know when the fire is out.

CHARLIE ROSE: Yeah, but how do we know that? That's my question.

WARREN BUFFETT: Oh, well, well, we will know -- unemployment will top out late. But we'll know when the economy is really coming back.

CHARLIE ROSE: What will be the indication of that for us?

WARREN BUFFETT: Well, it will be -- it will be retail sales. It will be automobile sales. It will be when home construction starts coming back. It'll be -- there'll be plenty of economic signs -- they may be a little late in getting recognized. There's you know, the depth (ph) comes a little late.

CHARLIE ROSE: Right. Right.

WARREN BUFFETT: But we'll know. We'll know. We won't know -- we won't know when the turn happens, but three or four months later, we will know it's happened.

CHARLIE ROSE: And it's inevitable that's going to happen in the next year or two or later?

WARREN BUFFETT: Well, I like two better than one. But when you say inevitable, that doesn't mean it can't happen earlier.

CHARLIE ROSE: But I mean -- what would you worry about that might -- that we might not come back the way we ought to, that somehow there have been repercussions from this that will have lasting impact?

WARREN BUFFETT: Well, there will be some lasting impacts of certain types, but in terms of coming out of it, I don't worry. If you had some big exogenous event -- if you had a major-- either by a country or by terrorists -- sort of a 9/11 squared or something ...

CHARLIE ROSE: Right. Right.

WARREN BUFFETT: ... a huge anthrax attack or something like that, you know.

CHARLIE ROSE: Or oil went to \$250 a barrel or something like that.

WARREN BUFFETT: If oil rose to \$250 a barrel, there can be certain exogenous effects that could ...

CHARLIE ROSE: So, that kind of thing would worry you the most that's likely to happen. Otherwise ...

WARREN BUFFETT: I mean, for some reason or another, 5 million barrels a day of oil out of the 85 million barrels, you know, got shut off, and more or less looked like permanently at the time, you know, there would be a lot of disruption in this world.

CHARLIE ROSE: When you look at the lessons we have learned, one was as you have suggested, way overleveraged.

WARREN BUFFETT: Yes.

CHARLIE ROSE: We also experienced a bubble, a housing bubble. We will have other bubbles.

WARREN BUFFETT: We'll have other bubbles. I'll guarantee you.

CHARLIE ROSE: Are we going to go back to the same kind of leverage?

WARREN BUFFETT: Not for a while. We learn lessons and they last for a while, and the deeper the wounds, to some extent, the longer they last. I was a beneficiary of that. I mean, I got out of school in 1951, and all of my competitors were still worried about the Great Depression, and my memory wasn't good enough so I had forgotten. So, this -- this will have -- this will have an impact on thinking for quite a while in certain respects. But fear, greed, folly ...

CHARLIE ROSE: Not going to change.

WARREN BUFFETT: No, we haven't -- we haven't gotten rid of those. We get smarter in all kinds of ways. We don't get smarter emotionally.

CHARLIE ROSE: Why is that?

WARREN BUFFETT: It's just the way the human animal is put together. You know I mean ...

CHARLIE ROSE: The memory fades and all of a sudden the new temptation is there.

WARREN BUFFETT: Yeah, you know, and plus, you know, plus being greedy can be fun for a while, I guess. You know, leverage can be fun when it works.

CHARLIE ROSE: Yes.

WARREN BUFFETT: Leverage -- leverage is one of those things that works 99 times out of 100, and when it doesn't, you know, it's all over.

CHARLIE ROSE: How do you explain the fact that you always enjoyed making it more than even spending it? You enjoy making it and investing it, but not necessarily spending it.

WARREN BUFFETT: Well, I have everything I want in life, so there's nothing to spend it on. I mean, I could have 10 houses instead of one, would I be happier? No way. I could have 10 cars instead of, you know, two in the house. I wouldn't be happier. You know, it would drive me crazy. I could have a 400-foot boat, you know, and then I've got to have a crew of 50 or 60, and some of them (inaudible), sleeping together -- I mean, who knows what would be going on. So I don't -- if I wanted to be a ship's captain, you know, I'd have gone into a different profession. I have everything in life I want.

CHARLIE ROSE: And what you enjoy doing is studying where we are, understanding, doing the kind of analysis through conversations and reading ...

WARREN BUFFETT: I love working -- I love working with the people I work with. I love just viewing the human scene, but I mean, I have an ideal life. I get to do what I want to do every day. So, you know, and money can't -- can't buy any more than that.

CHARLIE ROSE: What do you think of a value added tax?

WARREN BUFFETT: Well, I don't -- I basically don't like it because it's somewhat akin, it is not the same, but it's somewhat akin to a sales tax. I mean it has -- it has ...

CHARLIE ROSE: It's regressive.

WARREN BUFFETT: Yeah, it's regressive, and, you know, we don't need more regressive taxes in the United States.

CHARLIE ROSE: That's why you don't like cap and trade.

WARREN BUFFETT: Yeah, well, that's right. In terms of the way it falls on people, absolutely. I think that if we're looking for more money, we ought to look to guys like me. I mean, I am still paying a lower rate on dividends and capital gains than my cleaning lady. It's, you know, in terms of her payroll tax, just to start with. And so, I just think that we've gotten so far out of whack in terms of who's been prosperous in recent years, and most of the economy -- most people have been left behind, you know. So we learn that a rising tide lifts all yachts. (LAUGHTER)

CHARLIE ROSE: But there are not a lot of guys like you to start with.

WARREN BUFFETT: Well, there are some.

CHARLIE ROSE: Well, but you're the top of the list there with -- you and Bill. But there is also this -- what is an appropriate rate of taxation of people like you before, as some conservatives and supply-siders argue, you begin to somehow inhibit growth?

WARREN BUFFETT: Yeah. Well, I -- I worked through all kinds of systems of taxation.

CHARLIE ROSE: Right.

WARREN BUFFETT: And I worked with rich people, you know, even in the '50s and the '60s, and I worked with them when the top rate was 70 percent. I worked with them when capital gains rates were 39.6 percent, and not one of them said, you know, it's 1:00, and instead of working this afternoon I think I'll go to the movies because my marginal rate is so high. I mean, if anything, they worked harder, Charlie.

CHARLIE ROSE: The reason they got rich is because they worked hard.

WARREN BUFFETT: I never had one person -- I had hundreds of people ...

CHARLIE ROSE: Yeah.

WARREN BUFFETT: ... you know, in the partnership ...

CHARLIE ROSE: Right.

WARREN BUFFETT: ... and not one of them ever came to me and said, "Warren, I decided to hell with it. 39.6 percent, I'm not going to invest my money." What would they do with it, stick it under the mattress?

CHARLIE ROSE: Does that mean that the American system is in a sense a bit unfair and geared to the rich?

WARREN BUFFETT: Well, I think it has become more geared to the rich as time has gone by, and I think that the rich have, you know, obviously a disproportionate impact, you know, on how Congress behaves, and...

CHARLIE ROSE: Money in politics.

WARREN BUFFETT: You basically have to -- if you have a very rich country with a great number of superrich, you have to fight against a plutocracy. I mean, you know, the Congress has to be your bore (ph) -- for the principles of democracy to win out over a plutocracy, and we've done that well in this country. But it's a constant fight. I mean, you know, K Street is not populated by a whole people -- a whole bunch of people who represent my cleaning woman. And if you look at the Forbes 400, you'll find that, you know, they find their way to K Street, and it finds their way to them.

CHARLIE ROSE: Sure. They have multiple voices on K Street.

WARREN BUFFETT: They care. Sure. They care.

CHARLIE ROSE: So, what would you do about that?

WARREN BUFFETT: Well, it's always a problem.

CHARLIE ROSE: Yeah.

WARREN BUFFETT: And you want a prosperous country so you want a whole bunch of rich people, but you also want everybody to do reasonably well in something as prosperous as we have. We have \$45,000 of GDP per capita in the United States ...

CHARLIE ROSE: Yes.

WARREN BUFFETT: ... but we've got -- we've got almost 60 million people living in households where 20 -- the top income is \$21,000 or less. That's the top of the 60 million people. So we can do better. Now, we have done better over time. I mean, we put in Social Security and we've done things in the country that have worked in the direction ...

CHARLIE ROSE: Medicare and Medicaid.

WARREN BUFFETT: Yeah.

CHARLIE ROSE: Yeah.

WARREN BUFFETT: But a prosperous country should not just be prosperous for the people like me who are wired in a particular way at birth -- no credit to me -- but I happen to know something about capital allocation. It wasn't, you know, I could have instead -- I could have been -- I could have been wired, you know, so I was, you know, I don't know -- a great ukulele player. But there's more money ...

CHARLIE ROSE: Sometimes you can be both.

WARREN BUFFETT: Yeah, well, not often. Not in this case anyway. But there's more money in what I do.

CHARLIE ROSE: Yes.

WARREN BUFFETT: And you don't want to mess up the market system that works to bring out of people what their best talents are, but the market system is not perfect in any kind of distribution of wealth. And taxation is a way where you get to the excesses of what the market system produces and where you take care of the people that get the short straws. In a country as prosperous as we are, nobody should get a really short straw.

CHARLIE ROSE: You know, some people are going to hear you say that and they'll say, "Warren is talking about sharing the wealth. There he goes .."

WARREN BUFFETT: Well, I'm talking about sharing the prosperity.

CHARLIE ROSE: You're ... (CROSSTALK)

WARREN BUFFETT: I'm prosperous because of the society around me. Stick me down in some poor country and I'll walk around and say I allocate capital, you know, and they'll say, so what? What we need is a guy with a strong back. You know, and I don't have a strong back.

CHARLIE ROSE: But can you row a boat or something?

WARREN BUFFETT: Yeah. Something like that.

CHARLIE ROSE: Right.

WARREN BUFFETT: So -- so society -- listen, when a couple of middleweights fight it out on Pay Per View this weekend and get \$49.95 from me, or whatever it maybe, and I can't remember their names two

weeks later, you know, they are benefiting not because of their own talent that much, but because some guy invented television and then invented cable television, and learned how to change a stadium of 15,000 people into a stadium of 300 million. So they benefit from society. We all do. And some like me benefit enormously from society, you know. I can't do it by myself. Stick me on a desert island, you know, you do not want to be on the same island.

CHARLIE ROSE: There is this, also. The Bush administration says that when the economic crisis came, they treated it with a tactic, which was doing what they did. They worry that what the Obama administration is doing is a strategy to put in place a different attitude about the relationship between the government and the economy.

WARREN BUFFETT: Yeah, I don't think the Obama administration wants the government to take over the economy. But they did -- they took on a situation -- and incidentally, I can give credit to the Bush administration in that last four or five months of 2008. I mean, a lot of right things were done. I mean, when George Bush said, you know, if money doesn't ease up -- if money doesn't ease up, this sucker can go down. That was one of the most profound economic statements ever made. He became the economist in chief as far as I was concerned at that point. But so I give them credit, too. But the Obama administration, they're not running General Motors because they want to run General Motors. I mean, it isn't like that Barack Obama grew up wanting to run the whole American economy. They're doing well...

CHARLIE ROSE: Although he might want to buy a railroad, though.

WARREN BUFFETT: Yeah, well. (LAUGHTER)

CHARLIE ROSE: That's going to be ... (CROSSTALK)

WARREN BUFFETT: He'll buy it from me.

CHARLIE ROSE: But go ahead. It's a good -- but ...

WARREN BUFFETT: They are doing what is necessary in their view to get this economy righted. Nobody makes perfect decisions on this. And they're doing things I'm sure they don't like to do. I don't think they want to run General Motors, you know, or Chrysler or anything of the sort ...

CHARLIE ROSE: Or own AIG?

WARREN BUFFETT: No. (CROSSTALK)

WARREN BUFFETT: That is no fun. Or prop up Freddie and Fannie.

CHARLIE ROSE: So, all these people who think that somehow there's some new idea about -- they use the word "socialism," but something else in terms of ...

WARREN BUFFETT: Yeah, Barack Obama ...

CHARLIE ROSE: You don't buy that.

WARREN BUFFETT: Barack Obama wants a much more prosperous economy, embodying the principles that have made it prosperous, but I think he does want to make sure that the bottom 20 or 30 percent does better than it has done in the last 20 years while the top has prospered so much.

CHARLIE ROSE: That brings us to the question beyond whether Congress has the will or not, there is this idea, which is how do you create a new regulatory platform and architecture. And you've got on the one hand the administration comes in and says let the Federal Reserve do it, then you have Chris Dodd

who says no, no, no, don't do that. And then Barney Frank says I'm somewhere halfway in between. Where is Warren Buffett?

WARREN BUFFETT: I am 100 percent for the independence of the Fed.

CHARLIE ROSE: Right.

WARREN BUFFETT: I mean, if you have a central bank that is bowing to the will of Congress, either directly or indirectly, through some of the various (ph) mechanisms, it would be a disaster.

CHARLIE ROSE: Who wants to be in on their monetary decisions or oversight or whatever...

WARREN BUFFETT: Yeah, you've got to hope you've got a good Fed chairman and some good members, but -- and we've done that generally. If Paul Volcker was -- you know, he was essential to this country coming out of that 1979-'82 period like we did. Ben Bernanke was essential to keeping us from going into the abyss last September. We need -- we need an independent Fed, and I think every country needs an independent federal bank.

CHARLIE ROSE: But does that mean they should be the regulator as well?

WARREN BUFFETT: Somebody has to regulate, and banks do need regulation.

CHARLIE ROSE: Do we need one regulator, one big regulator that will ...

WARREN BUFFETT: Well, if it was me, I would like it. I mean I -- I -- because you need -- you need somebody that does have a big stick.

CHARLIE ROSE: Yes.

WARREN BUFFETT: I mean, left to their own devices, people will take on too much leverage. They may not this year or next year, but the financial institutions, particularly if they're promising they're going to increase their earnings per share every quarter, and they'll do off-balance sheets, things -- all of these sins that were committed a few years ago.

CHARLIE ROSE: Right.

WARREN BUFFETT: You know, Freddie and Fannie did a lot of them, too, and they were regulated by Congress.

CHARLIE ROSE: And they had 200 regulators marching into the office every day.

WARREN BUFFETT: So we've had Congress regulate the two of the five or six most important financial institutions in the United States, and it was a total flop. So it's tough being a regulator, and -- but you want somebody that is independent, somebody that has got real muscle, and hopefully somebody that, you know, who has an understanding of what you need to do to keep the system working well.

CHARLIE ROSE: And that's the Federal Reserve.

WARREN BUFFETT: I think they're good at it. Yes. You know, they weren't perfect this time around, and, you know, but Congress wasn't perfect, either.

CHARLIE ROSE: But once the problem came, they responded, and you had untold admiration for Bernanke.

WARREN BUFFETT: If he hadn't have had the authority he had...

CHARLIE ROSE: Yeah.

WARREN BUFFETT: ... and maybe -- maybe if he even had and thought he had a little more authority than he even did have last fall -- I mean, there's something to that, you know. I mean, you had to have somebody that would step up and guarantee money market funds, you know, keep commercial paper flowing, do these things that not many people could have done. And certainly Congress couldn't have done them with the speed -- you know, and speed was absolutely essential. I mean, you did not have a lot of time to save this patient.

CHARLIE ROSE: And they understood that, too.

WARREN BUFFETT: And they really understood it.

CHARLIE ROSE: And reacted. And gained a lot of power and used it. There's also this -- you cannot establish a particular leverage ratio, can you? You can't say that 15:1 is as far as it should ever be.

WARREN BUFFETT: No, if you have a bank that owns nothing but short-term government bonds, they can have 50:1, and if you got them, you know, they've got a whole bunch of money lent out to other guys who were leveraged in various ways, in various speculative things, five to one is too much, so pure numbers don't work.

CHARLIE ROSE: So what works?

WARREN BUFFETT: That is the problem. That is the problem.

CHARLIE ROSE: That's why...

WARREN BUFFETT: No, I mean, if you could just stick a bunch of ratios out there, it would be all over.

CHARLIE ROSE: But what works? I mean, it's the problem, give me a possible way of dealing with the problem.

WARREN BUFFETT: I would like to have a very smart, strong regulator that understood the nuances of different kinds of leverage and what it might mean. And one who would be willing not only to use those rules of individual institutions, but who would speak out to the country. You can't speak out too often and have it meaningful, but who would speak out to the country about a generalized problem. Because that's what we needed. It wasn't -- it wasn't the fact that it was bank "A" or bank "B" or bank "C." What was happening was that you were having a bubble that everybody was joining in, and speaking out on that -- which requires a lot of guts and may even get ignored, although if it comes from somebody that is running the Fed, you know, or whomever, or the president of the United States, I mean there can be people that will have an impact on that.

CHARLIE ROSE: You've said that you're not in favor of too much coddling and that you'd like to see the stick used more.

WARREN BUFFETT: Absolutely.

CHARLIE ROSE: Tell us what you meant.

WARREN BUFFETT: Well, what I mean is, that if you run a financial institution -- and it's financial institutions overwhelmingly that do tend to create the problems because there's this aggregation of capital -- if you run a financial institution that in effect can bring down the system, unless the federal government steps in ...

CHARLIE ROSE: Right.

WARREN BUFFETT: If you get to that point, I think something very bad should happen to you. I don't think you should walk away with a lot of money or even with 10 percent of your previous net worth or anything of the sort. And I think the directors who selected you and let you operate in that manner should have some real downside. You know, I'm not for shooting them, but I'm for ...

CHARLIE ROSE: But the threat of it would be...

WARREN BUFFETT: I want to make it painful for them. I mean, seriously ...

CHARLIE ROSE: Painful would be they -- what, they can't buy insurance?

WARREN BUFFETT: No, yeah, well, I would probably have in terms of the very large financial institutions, if they have to go to the government, you know, and the government had to act -- because there are going to always be too big to fail institutions.

CHARLIE ROSE: Right.

WARREN BUFFETT: It drives regulators crazy, but that's the reality of it-- and if an institution comes in and says, If we go down, we're pulling the whole country down with us, I think that the directors and the CEO of an institution like that, I think the directors say -- should certainly have to give back -- you know, they should -- five times the highest fee they've received in the previous year, because you're sitting around those places now getting \$200,000 to \$300,000 a year, you know. And for the -- all I want from my \$200,000 to \$300,000 a year is somebody that is selecting and designing a compensation system for the person they put in charge, the CEO, who should be the chief risk officer. I want them to have a system that penalizes that person very, very significantly, and if they don't -- they don't create that kind -- if they pick the wrong person or they let that person go off the reservation, I want them to pay, also.

CHARLIE ROSE: All right. So, let me just --you want there to be a penalty for directors who do not do their job.

WARREN BUFFETT: Yeah.

CHARLIE ROSE: But you recognize that there are going to be financial institutions that are too big to fail. It has been and will continue to be.

WARREN BUFFETT: It will continue to be.

CHARLIE ROSE: You can't simply say we're going to let anybody fail no matter how big, no matter what the consequences.

WARREN BUFFETT: No, we're just going to have a mom and pop bank on every corner, and it isn't going to work.

CHARLIE ROSE: Do you think that the financial community has any sense of I'm sorry?

WARREN BUFFETT: Well, most of them didn't do it, I mean, in the sense that-- if you take the leaders of these institutions that got them in, a lot of them are gone. Now, they're gone with more money than I would like to have them gone with. And I think what's infuriating to the American public -- if you take the people in Omaha, you know, they have seen lots of unemployment. They've seen in many cases their homes or friends' homes foreclosed. They've seen all these things happen to them, and nobody's going to jail. And as far as they're concerned, the leaders of institution A, B, or C, that have in a big way

contributed to these problems, you know, they may be worth -- they may be worth \$10 million instead of \$100 million or something like that, but they don't see anybody going to jail. They don't see -- they don't see anybody being held very responsible for it.

CHARLIE ROSE: And they don't believe that if they were in the same place, a much lower investment, that anybody would have come along and taken care of them.

WARREN BUFFETT: Well, yeah, and they're right about that. I mean, if I have a tiny little business that fails, it doesn't affect the United States. But if you have Freddie Mac and -- Mac and Fannie Mae ...

CHARLIE ROSE: Or AIG.

WARREN BUFFETT: Or AIG.

CHARLIE ROSE: Or Citicorp.

WARREN BUFFETT: Yeah, they -- and they -- it would have affected us. I mean, we could not stand those dominoes falling. And it drives people crazy that we couldn't, but we couldn't. I mean, if those -- if a few more dominoes had fallen, if that weekend of September 12 to 14th, or whatever it was, if one more domino then, you know, Merrill Lynch going, Morgan Stanley would have been next -- if the dominoes were so lined up, and they were so big that ...

CHARLIE ROSE: Without the government, they would have gone down.

WARREN BUFFETT: They would have gone down. But bear this in mind -- they talk about moral hazard on this. There isn't any moral hazard. If you look at Citi, 90 percent of the market value has disappeared. If you look at Freddie Mac, 90 percent of the market value -- more than that.

CHARLIE ROSE: Look at AIG.

WARREN BUFFETT: Fannie Mae, AIG, all of them. So, the stockholders have gotten totally creamed. The owners have gotten totally creamed. So, it's not like anybody who was a stockholder of Citi or Freddie, or Fannie, or AIG or you name it, is thinking, ha-ha, you know, the system is going to save me. Because it didn't save them. They got killed. But the guys at the top did not get -- you know, in most cases, did not get killed. And they're the ones that made the mistakes.

CHARLIE ROSE: And should they have gotten killed, so to speak?

WARREN BUFFETT: It should have been harder for them.

CHARLIE ROSE: And so, how would the government have done that?

WARREN BUFFETT: I would probably have something with those kinds of institution where no one got rich from running an institution like that until about five years after they left. I mean ...

CHARLIE ROSE: Yeah.

WARREN BUFFETT: And I'd have had a very restricted and I'd have clawbacks, and I'd be plenty tough, and I'd be tough on the directors if they hadn't put in those kind of arrangements.

CHARLIE ROSE: And they say that now, if you listen to the financial executives today, they say we're in favor of clawbacks, and we've instituted those kinds of things. I don't know whether they have or not...

WARREN BUFFETT: Well, they've done some, but I'd probably square it.

CHARLIE ROSE: Make it exponentially.

WARREN BUFFETT: Well -- and I wouldn't let them buy -- against this sort of risk, I wouldn't let them buy directors officers insurance -- liability insurance.

CHARLIE ROSE: Right.

WARREN BUFFETT: We don't have that at Berkshire. I mean, if our shareholders are going to go down, I want me to go down with them and the directors to go down with them. You know, we've taken on the job. And, you know, if the ship goes down, we should not get the first lifeboat.

CHARLIE ROSE: When you look at that year -- this is a book by Andrew Ross Sorkin ...

WARREN BUFFETT: It's a very good ...

CHARLIE ROSE: It's a very good book.

WARREN BUFFETT: It's a very good book.

CHARLIE ROSE: And you're in there. Moments for you, I mean you were at the other end of phone calls from people who ...

WARREN BUFFETT: Who wanted money. (LAUGHTER)

CHARLIE ROSE: Who wanted money. And in some cases advice, but mostly money.

WARREN BUFFETT: Mostly -- yeah, they'd take money before -- if there was a choice between money and advice, right...

CHARLIE ROSE: They'll take money. So, they mostly wanted money. Are there moments you look back in which you said no that you might have said yes? I mean, do you have any sense of ...

WARREN BUFFETT: You just

CHARLIE ROSE: I know you do. (CROSSTALK)

WARREN BUFFETT: I mean, it's just like standing at that plate and the pitch comes in and you have got a half a second to decide whether to swing.

CHARLIE ROSE: Yeah.

WARREN BUFFETT: You know. No.

CHARLIE ROSE: I know you're not a man to agonize, but I mean have -- I mean ...

WARREN BUFFETT: Or, I could have done way smarter things.

CHARLIE ROSE: Like?

WARREN BUFFETT: I did not optimize the period.

CHARLIE ROSE: Right. Because you had money and they needed money and they would have given up a lot for that money.

WARREN BUFFETT: Yeah, plus, the bottom of the market was six months later, I mean, and it was significantly lower. So if I just saved the money, just put it in the market six months later, I would have done way better than making these deals.

CHARLIE ROSE: Right. Right.

WARREN BUFFETT: But I didn't know that at the time.

CHARLIE ROSE: So you said I'm optimistic, but I'm not sure my optimism is justified.

WARREN BUFFETT: Well, I don't try to pick bottoms. No, I really -- when something -- when I get a call and it makes sense and I've got the money, I do it. You know.

CHARLIE ROSE: Yes.

WARREN BUFFETT: And I don't think I can do this better tomorrow or the next day, or that sort of thing. But most of the things didn't make sense.

CHARLIE ROSE: But here's something else you taught me as well -- you don't get that many swings at the bat.

WARREN BUFFETT: Not with big sums.

CHARLIE ROSE: With big sums.

WARREN BUFFETT: Yes, with big sums.

CHARLIE ROSE: So if you look at Burlington Northern, is that-- that was a big - that was a big sum.

WARREN BUFFETT: Yeah. And you don't get bargains on things like that. It's not cheap.

CHARLIE ROSE: But that was a bargain?

WARREN BUFFETT: No, it's not a bargain.

CHARLIE ROSE: I didn't think so. That's what I'm asking you.

WARREN BUFFETT: No, but it's a good asset to own for Berkshire over the next century.

CHARLIE ROSE: But does it restrict how many -- suppose tomorrow a great thing came along that you didn't know. Would you say, "oh, my God..."

WARREN BUFFETT: Well, it could happen. I mean, if the Union Pacific came along at half the price - you know, but I don't worry about that sort of thing at all, Charlie.

CHARLIE ROSE: So when we look back at this time, for one who loves-- who loves understanding what's going on and where it's going -- you said to me before, you know, you might sacrifice the last year of your life if somebody would come along and say, "Warren, I can tell you what the next 40 years are going to look like. All the questions you have, I can answer."

WARREN BUFFETT: Or just let me watch. Just let me watch the next 40 years. The last year, you know, you don't get to be here, but the next 40 years you get to watch. Kind of like Chauncey Gardiner, he liked to watch.

CHARLIE ROSE: So as we put a cap on this, we're going to come out of this OK.

WARREN BUFFETT: Absolutely.

CHARLIE ROSE: We've got some real problems we have to deal with. The deficit is one. How we learn the lessons of this in terms of finding some kind of regulation that works. And have confidence that we

got here because we had unique kinds of skills. Go back to 1776 and see what a few group of people did and where we are today, makes you an optimistic about America, but also optimistic about the world.
(CROSSTALK)

CHARLIE ROSE: As the center of gravity moves to Asia.

WARREN BUFFETT: It's wonderful that the lessons we learned over the last couple of hundred years are being absorbed in many parts of the world. I mean, people have seen success and they've had the sense to copy some of it, and get into their own system those ingredients that have done it for us. But we haven't lost the ingredients. The fact that they're able to use the ingredients does not take it away from us. And every year of my life, I could sit down at the start of the year and write on a pad a dozen things that were looming over the economy. When people say, "I'm not buying stocks now because times are uncertain," I say to them, so, I say to them, "well, on September 10th, 2001, were times certain?" You thought they were certain, but you found out the next day they weren't. On October 18th, 1987, before the -- the day the Dow took that 22 percent -- things are always uncertain in the short term. What really is certain is the things that worked over time will continue to work over time. So the next day is always uncertain. The next hour is always uncertain. The longer term is pretty darn certain.

CHARLIE ROSE: Warren, thank you.

WARREN BUFFETT: Thank you.

CHARLIE ROSE: It's always great to see you. Warren Buffett for the hour. Thank you very much for joining us. We'll see you next time.

The \$600 Billion Challenge (2010)

6/16/2010

Charlie Rose: where people's lives are changed forever. The Giving Pledge, next. Bill and Melinda Gates and Warren Buffett changed philanthropy in 2006, and now they are doing it again. In a dramatic announcement that could have huge implications for the world of giving, the three of them said today they're asking America's wealthiest people to pledge at least half of their net worth to charity. They're calling it "The Giving Pledge." It encourages donors to give to their favorite cause but not to any particular foundation. Today's announcement does not ask for specific grants. It simply asks for a moral commitment. There have been four pledges acknowledged. They are Eli Edythe Broad, John Doerr, Gerry Lenfest, and John and Tashia Morgridge. If successful the pledges could generate \$600 billion for a wide variety of specific needs. The history partnership between the Gates and Buffett began in 2006 when Buffett pledged 99 percent of his \$40 plus billion fortune to the Bill and Melinda Gates foundation. Bill and Melinda Gates and Warren Buffett came to our table to talk about that extraordinary joining of forces at the time.

Warren Buffett: It's something I always planned. My wife Susie and I planned whatever I made would go back to society. And originally I thought she would outlive me and she'd make the big decision on it, the manner. But since her death, I had to rethink the best way to get the money into society and have it used in the most effective way. And I had a solution staring me in the face. And I'd seen Bill and Melinda do what they have done with their foundation. They've done it with their own money. They've poured themselves into it. The decisions are great. Their goals are similar to mine. So the time is now.

Charlie Rose: Bill has already given you a book to start reading about these issues.

Warren Buffett: There will probably be a quiz after the show.

Charlie Rose: We'll get to some of those questions. How much do you know about malaria, tuberculosis?

Warren Buffett: I think he wants me to contract all of these diseases so I can work on it.

Charlie Rose: How do you two see the significance of this, for you, for the causes you serve?

Melinda Gates: Well, for us it's just fantastic, because we look at it as doubling the impact. The diseases we've already been working on and the education and inequities we've been looking at for so long basically double by Warren's gift. And it's incredible the depth we'll be able to go to on these global health issues.

Charlie Rose: Bill?

Bill Gates: It's a huge responsibility. In some ways if you make mistakes with your own money, you don't feel as bad about it as if it's someone else's.

Charlie Rose: Exactly.

Bill Gates: So now we're more intent on doing it right. And it's a very exciting time. The advances in medicine and other things we can do to relieve poverty. We've been making good progress, and with the doubling of resources, we think our impact can even more than double. And so it's thrilling, but it's a huge responsibility.

Charlie Rose: The idea for the Giving Pledge originated with Warren Buffett and led to a series of dinners organized by the Gates. The first was held in 2009, hosted by David Rockefeller at Rockefeller

[More Compilations](#)

University. Other dinners across the country brought together men and women of huge wealth to talk about the experience of giving. The giving pledge is targeted at the richest billionaires in America. Hopefully it will spread around the world. I flew to Redmond, Washington, last month to record a conversation about today's announcement with Warren and Bill and Melinda. It is their only television appearance regarding this extraordinary pledge. In addition to this program, Carol Loomis also has a story in an article called "The \$600 Billion Challenge" appearing today in "Fortune" magazine. At the time of the conversation with Bill and Melinda Gates and Warren Buffett on the Microsoft campus in Redmond, I agreed to delay telecast of this conversation until the joint announcement could be made in "Fortune" magazine and on this program. We began first asking Bill Gates what is the pledge, what they hope it achieves, and how it turns out.

Bill Gates: It's quite simple. The idea is that people who are engaged in philanthropy will write a letter talking about what they're doing, and they make a commitment to give the majority of their wealth either during their life or through their will. And we want to get the people who do this together. We think they can share ideas, learn from each other, encourage others. And so we're kicking this idea off and going to invite lots to join in.

Charlie Rose: So you can give any time?

Melinda Gates: You can give any time. The idea is to make the commitment, to get over the hurdle, saying don't wait until I think about this later in my life, but think about it now and think about giving. And we hope a lot of people will end up choosing to give during their lifetime, because it's not just about giving their money. They can wait until the end if that's what they want to do. But when people start thinking about philanthropy and putting their minds to it, it can change society. So it's neat to get together and get to talk with people about how they are thinking about their philanthropy.

Charlie Rose: The pledge is a contract or moral obligation?

Warren Buffett: It's a moral obligation. We don't want people to go to their lawyers and tell them they need a 40-page document with 28 escape clauses or something. If -- I would say that almost everybody would make a pledge like this would keep it. And it's a serious pledge, but it's not a legal pledge. It's a moral pledge.

Charlie Rose: This is not about the Gates Foundation. This is about this idea that you hope people will buy into. The driving idea is to have people think about philanthropy, think about what?

Bill Gates: It really came out of some dinners that we had with people who are engaged in philanthropy. It's so wonderful to hear what they're doing, their excitement, how they changed over time. And we decided that that was so helpful to us, and it drove up the energy in the room for, I think, everybody through three different dinners we did like that. But the discussion became, OK, how do you draw other people in? People tend to wait. They may not know the neat things going on. So through those discussions, the idea of a pledge came up and by the third dinner it was quite concrete. Keep it simple. It's not a pooling. It's not saying some way of giving is right. It's a pledge, and the people who take that pledge will be getting together and celebrating the diversity of the way they do things.

Charlie Rose: How did the dinners come agent?

Melinda Gates: We started originally of talking about the ideas of what stimulated us to give back and how do you stimulate other people to do it? I think Warren initially started that conversation with us, and we said well, let's get other people together to talk about this. So then we had this idea of having this first dinner, which David Rockefeller hosted. And from there it kind of took on a life of its own because

people brought in their own thinking to it and their own ideas. That's where we landed on this idea of, yes, let's give a pledge. And I think one of the cool things we learned in the dinner is that we know that philanthropy is very personal. So to us it doesn't matter what people give, whether it's to culture or climate or humanity or societal issues. It's what they're driven by that gets them to give. And we just want to make sure they're thinking about giving. And there's energy around that now.

Charlie Rose: Take me back to the first dinner and what it was like. What was the feeling? What were the questions?

Warren Buffett: Well, we didn't know going in. David Rockefeller was -- very nicely hosted the dinner. And we had maybe seven -- mostly couples. There might have been one two that were there singly. And we just started going around the table. And I asked each either couple or individual to sort of give us the story of the evolution of their own philanthropic thinking and how they got where they are now and what they hope to accomplish. Well, it was incredible because it was probably two hours to get around that table, Charlie. People, they wanted to talk about their ideas and they wanted to listen to the others. I mean, they were just as interested when the other person was talking as when they were. So by the time we got around that table, I think maybe we were starting to form a little idea that if this sort of enthusiasm and commitment could be talked about to others, that there might be many people out there who would maybe postpone thinking about what they were going to do with their wealth and all of that to get active now.

Charlie Rose: And what were the kinds of questions people asked?

Bill Gates: Well, everyone has their own story of what caused, drew them in, how they involve their children, how they learn about that cause. And they had a lot of questions. They -- topics came up. There were a lot of different ideas around. But the general energy and kind of a wish that you could share how much fun it is and that people knew what impact you could have. And one thing more I would like to say is no one said that they felt bad they've given the money. Everybody felt more fulfilled, were able to use their creativity in some special ways. And they wanted to think about how you would share that. And what it ended up being a very straightforward pledge that's going to lead to people getting together on a regular basis.

Warren Buffett: But, Charlie, I would bet if -- at the three dinners, maybe there were 20 or so couples involved -- I would bet that a number of them-- as committed as they'd been before, left with new ideas and an even firmer determination to get on with it in terms of what they'd already believed. I mean, it was -- You know, maybe that's what happens at church services or something. I don't know. But all I can tell you is it was noticeable.

Charlie Rose: How are you going to choose who you're going to reach out to propose a pledge?

Warren Buffett: We thought we'd start with you, Charlie.

Melinda Gates: There you go. Well, the people who came to the dinner, actually, sever of them came to us right after and said I am really interested in this idea. So we already have four people that have said to us we want to be included in trying to help get others to give. But we'll reach out to those 20 or so couples that came to the dinner and we and they will continue to reach out to others to say this is something that's doable. This is something we'd like to get people to sign up for.

Charlie Rose: Is ther structure? Is there process? Is there an organization to be?

Melinda Gates: There' is a web site called thegivingpledge.org that people can go to. That's where we will put up all the pledges so the people who sign the letter that say "I'm going to give away 50 percent," the

letter will be up there, the pledge. And people will write one or two pages about their philosophy of giving. Those will be up on the website. As well, that web site will link to other places. There are a lot of other people that have been giving for a long time or think about giving. There's a website called boldergiving.org that helps people think about how do you give your money away, and we'll link to those places.

Charlie Rose: So somebody comes to you and says I've been reading about this, tell me why I should do a pledge.

Warren Buffett: Well, you do it only if it appeals to you personally. It's your money. I'll tell you what it means to me and what it's meant to a number of other people I've talked to over time. It's different for every person. They've got different kinds of assets, different interests. If somebody in their family was hit by a specific illness they're much more likely to be interested, for example, in research on that or something of the sort. But what I would tell them is decide what you want to do. Many, many people -- rich people live longer, one advantage of being rich. And so often those wills are made by people in their late 80s or early 90s when their faculties aren't as good, when their thinking isn't as good. Part of the reason I made the decision four or five years ago because beyond think my thinking if I lived to be 90 would be as good as my thinking at 75, or as clear. And we just want people to decide what they want to do but to listen to the experience of others who have decided to go in a given direction and see whether it appeals to them. And I think it will appeal to many.

Charlie Rose: What has it meant to you?

Warren Buffett: Well, I've had a philosophy really all my life on which it happened with my Berkshire share so every share was going to charity. So the truth is I've had everything in life, everything in life I've ever wanted. I have never given away any money that's caused me to give up a movie or dinner or trip to Disneyworld or anything of the sort. So it's cost me nothing. So I have these little pieces of paper in a safe deposit box which I bought about 40 or 45 years ago and they've grown in value enormously. And what they are is they're claim checks on something in the future. I don't have anything I need in the future. All kinds of other people have all kinds of needs. And it's a way of cashing those claim checks in a way where people's lives are changed for the better. Mine's already changed for the better. It couldn't get better. If those little pieces of paper translate whether it's into children avoiding diseases, becoming better educated, people having a better life in their own age, whatever it may be, that's terrific. I think a lot of people feel the same way.

Charlie Rose: What has it meant to you to be engaged in a philanthropic effort that touches the lives of other people?

Bill Gates: Well, it's become, really, our full-time focus, and there's so much that can be learned. There's great progress that gets made. There's setbacks. There's partnerships you find. And people who work in the field, people who do science. And it's been way more fun, way more engaging than we would have anticipated. And the opportunities are so clear. Now, you know, our way of going about it is one of many. But it's been really the most special experience I'd say for me personally and for us doing something together as a couple.

Melinda Gates: Absolutely. I think -- And if you said to us would we be as involved as we are now at the ages we are now? If we looked back when we first got engaged or married, we wouldn't have known we were going to be so drawn in and that it would be such a deepening part of our lives. I was just in India in March. The first person I wanted to come back to and talk about it was Bill. Bill just got back from India Saturday morning, we spent a lot of Saturday talking about what he learned in India. So to be able to do it

together and to see how it's evolved over time for us as a foundation and as a couple, I think that has been really engaging for us and as we talk to these other families when they came to these dinners, hearing how they got started, where they started in one place and evolved, I think that's what it's like for anybody that gets involved for whatever issue they choose.

Charlie Rose: Are there reasons that people don't do more today?

Warren Buffett: Well, I think they postpone the decision very often and I think --

Charlie Rose: Because it's complicated, or because they don't know how the go about it?

Warren Buffett: Some people think, you know, how would I start a foundation or something of the sort. Or how will I handle it? Just assume they've got a private business worth a great deal of money. But they think, how can I start giving money away now without giving away my business, or something? There's answer to all those sort of things. And actually in talking to these people at these dinners we learn how old they dealt with problems like that. But until they listen to somebody else, some people may just decide "I'll think about that tomorrow."

Charlie Rose: It sounds like these were emotional dinners.

Warren Buffett: They were. They were.

Melinda Gates: People were telling their life stories and how they got where they were.

Warren Buffett: I felt like a psychiatrist at some point. I mean, they talked about -- most of them had -- many of them had children that participated with them. Some of them had children that opted out from it. I mean, they had all kinds of different experiences and people were fascinated by it. I mean, you know, you've heard Bill and Melinda telling about their stories. We heard tale after tale. In our San Francisco it may have taken us three hours to get around the table where seven couples spoke. They opened up. They really opened up.

Bill Gates: It's a real mind shift. You've been making money. Giving away is a bit different. And you're not sure if you're going to find something. So it requires taking a little bit of a leap. You don't know how fulfilling that's going to be. You need to pick your scope because otherwise you're going to get more requests than you'll know how to deal with. You need to think about the structure and how you involve people. But it is so fulfilling. And these are very talented people. Society is better off if they choose to take some of their insights, some of the great people they know who also want to work in a philanthropic way and draw them in, if they're collaborating with others. You know, even though there's no agenda in the Giving Pledge, we do expect that people will meet each other and find common causes to work on together. No matter what it may be. And we saw a little bit of that in the after-dinner conversation. So it's -- we want more critical mass around this. We want more lessons. We want more "hey, think about it now, get involved in an earlier way." And the people at the dinner said yes, this is very straightforward, but it's something they felt that really should be done.

Warren Buffett: Charlie, I think there's two things that we bump into. One is people feel they will be swamped with requests. They see their life just being a big line outside their office or something of the sort. And nobody's looking forward to that. And the second thing I think they worry about is their money being used effectively. They'll read a story about this charity or that charity, and they're used to having measurements in their own businesses or whatever it may be and things that are very specific. And now you're talking about doing something through other people to help people 10,000 miles away. So they

want to learn more about how do you do this right? And if they listen to the kind of people we listen to, they will learn more about how to do it right. And we'll teach them how to say no to those people.

Charlie Rose: Talk a bit more about the emotion, what it was like in the room with people at these dinners that served such a pivotal place to turn you guys into creating something special.

Melinda Gates: I think that's what surprised us the most. We went into these dinners, we kind of didn't know what to expect. But to hear couples really talk about how they wrestled with this over time. I heard one couple said -- it was really sweet. He said "I always know my wife is going to bring up a big topic about philanthropy when we're driving together on a long drive and she turns the radio down." And they went on to talk about the most substantial gifts they'd ever given, their first enormous gift, and how that led to other gifts and how they think about it. So what was so neat about the dinners is people talking about how this early part of their life how they thought about making money, but then how their mind was shifting and how some of the small gifts were impactful to them but how the large gifts were, too. And to hear them share with one another -- here's where I started with my target, I didn't know where to go but here's how I learned. And somebody else said "I thought about that. How did you attack this particular piece?" So a lot of people were talking about in some cases education in the United States if that's what they're interested in, or climate change. So I think that's what drew us in. One of the things Peter Singer talks about in his book about saving lives is he says, you know, we do our what reference set does. So if you see somebody in your reference set doing what feels right to you and you see them having success in it and actually making change, you're more likely to act and be at your best. And I think for us sitting around that table, we were sitting with our reference set and we were hearing amazing things we didn't expect to hear.

Charlie Rose: What's the metric of success of the Giving Pledge?

Melinda Gates: I think it's saying that we've gotten people earlier in their life, this reference group of people and this set of billionaires to think earlier in their life about how they're going to give money back, whether it's during their lifetime or at their death, because they planned for it, they haven't pushed that decision off. And they've started to think about it and get going. If we've done that and said that is the way to think about philanthropy, you should think about these resources going back to society, then I think we will have started the conversation and felt great about it.

Warren Buffett: In 2008, that was the most recent estate tax figures, the estate tax forms that were filed, less than 40,000 of them, showed estates of about \$230 billion. That's one year in the United States. About 12 percent of that was left to charity of that \$230 billion. And I would hope 10, 20, 30 years from now that that number is a lot bigger than that. And I bet it will be.

Charlie Rose: If this is a roaring success, what are the possibilities and the difference it can make?

Bill Gates: Well, the history of philanthropy is an amazing thing. The libraries in America, Carnegie had a lot to do with that. Some of the medical research, Rockefeller had a lot to do with that. Highlighting causes that later became something the government got involved with, looking at the schools that the blacks were going into the south, Rockefeller gave a lot of money to that and really showed the incredible injustice that was there. So we're building on a legacy of some brilliant work that really made a difference. And even in this era, we have people like George Soros who've been creative going into the new societies in Eastern Europe and trying to get those going, and I think made a huge difference. He took a big risk. That's so creative. People like Chuck Heaney have done amazing things. So if you look, there are models. Now, we want diversity. We don't want people to fall into exactly the same patterns that other people have, because the new ideas are so catalytic. But it really makes a difference. And it's kind of

the best of capitalism. Somebody makes money, which is very enjoyable and you get, as Warren said, you lack for nothing, and then hopefully you're taking that ability and you're being smart that you say, OK, I was lucky, now let me create good circumstances for other people. In education, I know there's a lot of philanthropists that are funding things. It's making a huge difference in global health and climate. There's a broad set of things that would never happen without philanthropy.

Charlie Rose: But the point is, and you said there to me in a previous conversation in November of 2009, it's really when you think about what could be done and how huge the problems are, what we're getting from philanthropy today is just a small beginning.

Melinda Gates: Beginning. It is just the tip of the iceberg. But it can be used as a wedge on so many societal issues. If you look back 250 years ago, Adam Smith used to say that it was almost futile to even know what was going on around the world because you couldn't reach out and help somebody on another continent with their issues. Now we're so connected as a world both from transportation to communication, we even have people at very small levels. You can go up on the website and give something through keyhave.org and help a woman with her farm in Africa. Or in the U.S. teachers post what they need in their classroom, and through donorschoose.org I can go and say I want to make sure she gets the lesson plan funded she needs for her science lab. We're that connected. So whether you want to give in your local community, you want to give to something in the United States, you want to give something across the globe, it's easy to do now. For me that's the moment in time we're at now with philanthropy. And that's why this is so exciting.

Warren Buffett: This is 50 percent of wealth being pledged. But there are people who've got similar impulses that don't have money. But they can pledge 10 percent of their time or something of the sort. The idea is really to have everybody thinking about the subject. Now we're not -- we can't do it totally, but everybody has the opportunity, whether it's to mentor some young kid or whatever it may be, and I give them every bit of credit and maybe more than some guy like me who just hands over some stock certificates.

Charlie Rose: But that is, in fact, a very important point is the notion of connecting to what you can do is not limited to being a billionaire. This is not a billionaire's club --

Melinda Gates: No.

Charlie Rose: -- that somehow has got together to say maybe we can make a difference. It is a powerful idea that has potential.

Melinda Gates: And it's the right thing for that set to do. But really, you know, lots of people are talking about giving back. And people do things that are a lot more difficult than I think any of the three of us or the billionaires do themselves. When they're giving their time or they're giving half of what they make in a week and they have modest means, to me, those are my heroes in philanthropy. And so we're saying this is what we think is right for the people we know, but there's lots of people we hope will be inspired by this and lots of people we already know that are giving.

Charlie Rose: You mentioned Peter Singer who has a whole series of ways that certain income levels who are way below a billion dollars that you can make a certain percentage of the money and the difference it can make.

Melinda Gates: Absolutely. Or the family that talked about the book they wrote. They gave half away as a family. They said we're going to take \$800,000 and give it away and sell our dream house. They were

hesitant to go public with it because they said they're not trying to make a statement, but they felt so good about it and they were inspiring others that they decided that was something they should talk about.

Charlie Rose: What are the lessons you have learned?

Bill Gates: Well, you've got to get into the specific areas to start learning. Some problems are very difficult. Education is so important, every little bit of improvement can help there.

Charlie Rose: In fact, you have said education is much harder than global health.

Bill Gates: Yes. It may be.

Charlie Rose: Changing?

Bill Gates: It's not as subject to breakthroughs. We found that there are lots of people out there who aren't getting funded. Whether it's education innovators or whether it's scientists doing new vaccines. And it takes time before you can draw those people in. And so I love the fact that lots of philanthropists focus on a pretty small number of things. That you try and do everything, you're not going to get the joy of really knowing it deeply and having that expertise. And for us, we picked a couple things to help. Health and education are the biggest things. We're very happy we did that. We're going to stick with those because it's our focus. But we've got to cover the waterfront. We've got to have lots of different givers because there are many causes that we're not involved in that have got to be backed.

Charlie Rose: There's a kind of group support that comes out of it.

Melinda Gates: And that's why we gather -- after people pledge, we'll gather them once a year to talk about these issues and let them have workshops. We hope this will take on a life of its own so they'll talk about how did you get started? We'll keep joining, we'll keep learning, too. But we hope this takes on its own life and they continue to gather.

Warren Buffett: People wrestled with the idea of how to get their kids involved. Some have been successful at it, some haven't. But more will be successful if they listen to the ones that were successful.

Charlie Rose: It is said that the entrepreneurs today, younger entrepreneurs, are thinking more about philanthropy earlier than they ever have before. Is that your observation?

Bill Gates: I think that's fair. Most of the examples from the past most people waited fairly long. And now when you have things like technology fortunes that are made in your 30s or 40s, that's kind of different. You can get to your 50s or even earlier and actually consider should I shift my attention to this? Or can I in parallel keep doing my work and yet be giving my wealth away in a way that has impact? I first was reluctant to have the two different activities. Melinda and I talked about that and found a way of making it work. And you're going to have a lot more decades of very successful people deeply engaged in these issues. That really wasn't typical if you go back in the history of philanthropy.

Charlie Rose: If somebody comes to you and says look, I want to do it the way you did. I want a hands-on involvement. Should I do it or not? What would you say?

Bill Gates: If you're enthused to do that then clearly you should do it, because the trips you take, the people you meet will draw you in as much as whatever the wonderful contribution you made in making that fortune. And it broadens you as a person to be involved in these things.

Melinda Gates: Absolutely.

Charlie Rose: You've been involved in it longer fulltime than he's been involved in it fulltime. What's the evolution in your thinking about philanthropy and its possibilities and its potential?

Melinda Gates: Well, you know, I used to sometimes almost worry. I would go out to India or Bangladesh and think, oh, my gosh, am I going to come back overwhelmed? There's so much need. But in fact you go on the trips and every time you do one you come back and see a nugget or a possibility or a way to do something. And so I would come back so energized and then Bill and I would sit down and talk about it and we'd read a lot more, gather experts around us, and they would show us what's -- we'd learn the whole systematic problem. Then they would show us what's possible. So every time we came back it was a building on itself. And I would say that's still the way of our philanthropy. We're still learning in all the areas we chose in our target areas. But we really did at some point say these are our targets, these are the places we'll focus. When Warren made his unbelievable gift in 2006, he said keep doing what you're doing, don't try to broaden out, but keep taking risks. I think that's the thing we keep doing is saying how do we learn in these areas and get better and build over time as a couple and organization with those that surround us.

Bill Gates: I think people get put off at first because somebody who's analytic, you first have to say, oh, wow, these schools are way worse than I thought. And the food situation of a poor person in Africa is way worse than I thought. You think, OK that's kind of a downer. But as soon as you know that level and you say look at where they get women's groups in or they bet better seeds or you encourage government to take its resources and use them in a better way, you start to see the success stories. So Melinda is saying the theme at that point is much more,

Ok: So you've talked to people in London, Paris, and elsewhere. How is their response different than the American response, if it is?

Bill Gates: Well, I'd say one divide we saw is that if it's a first generation fortune, if the person involved made that fortune, they feel a latitude to decide, OK, a lot of this should go back to society and to pick exactly what that theme is. And because America's had more of those self-made fortunes where you could get enough capital, there was risk taking that it can happen in a dramatic way, we've had more philanthropy. Where you see in places like India and China now some of that taking place. There are great examples of people who've committed to give away not just half but in some cases virtually all of their money. So I'm not sure that there's that much cultural difference. I do think it's value to believe get that initial innovator thinking hard about what should happen to these what Warren calls claim checks.

Charlie Rose: Yes. The idea, too, that is fascinating to read about this is the sense of how desperate the money is needed. As much as you guys have and as much as the foundation has, there's so much more needed that the central fact is the need for more funds.

Melinda Gates: It's huge. And anybody who gets into this -- you know, their funding only be catalytic, it can only be the wedge, because the money that comes out of philanthropy will still be tiny compared to the world's needs. And so you have to say how can the thinking that comes from these organizations or the risks that these organizations will take because they'll think of a problem in a different way or tackle something in a different way with their money, how will then that then spread to actually change a societal issue? And that's how you've got to -- when you focus on the big issues, that's how you've got to think about it.

Warren Buffett: And the argument, incidentally, there will be certain people who have been successful and if you can show them how their money might be leveraged, that really appeals to them.

Charlie Rose: Leverage is an idea you understand.

Warren Buffett: Other people, it's just the emotional looking at a child that's been paralyzed or something. People respond to different motivations. The leverage aspect is important.

Bill Gates: And this is the first generation I think we can say that these issues really are kind of solvable. Can everybody on the planet have access to good education? Can everybody on the planet have access to the food that they need? Can we take the American dream of opportunity and renew that by having a better education system? These things are within reach. If you were a philanthropist 50 years ago, you know, you weren't -- you just weren't going to see that full achievement of what's possible. If you narrowed your vision to your neighborhood or country, that was a good way to go about it. But the amount of wealth in the world is phenomenal now and the incentive systems mean it's very unequally distributed. And those incentive systems are very good things. What allows you to have those incredible incentive systems and yet equity? Well, philanthropy is one of the answers. Government programs with philanthropy is the way to have the best of both worlds.

Warren Buffett: I would argue even in terms of the wealthy giving to philanthropy, I would argue it's not a bad thing in terms of your family. If you look at the Rockefeller family and dozens and dozens of that come from John D., Sr., I think the fact he behaved as he did in terms of philanthropy and that his son behaved that way, I think it's set a tone for the family that is vastly different than where you've seen people behave in exactly the reverse manner. You know, I would say very few families would be hurt in any way by having active participation in philanthropy, and I think many would be helped a lot. In my own case I think it's been very, very good for my family.

Charlie Rose: Tell me how.

Warren Buffett: Well, I've had three children and my wife and I enabled them to have their own philanthropic activities. I think they've become better citizens. I think they've become better sensitized to the problems people have in this world. I think they raise their own children in turn better. I think they have better values because they've actually been able, really through my wife initially, who was probably 99 percent responsible, but they have been sensitized to what you can do in this world and they've gone out and done it and combined their own energies and talents with the money that was allowed to them. And I think they have a better feeling about themselves, I think their children have a better feeling. I know their parents have a better feeling about them. I think it's a -- I think a philanthropic family on balance -- I mean, there's all kinds of exceptions. But a philanthropic family on balance is going to feel better about themselves and their progeny than a family that has been hanging on to every single penny.

Melinda Gates: When you think about where philanthropy is going and this generation coming up now as well. Who would have guessed a few years ago a Pulitzer Prize winning book "Mountains upon Mountains" would be about Paul Farmer who was backed initially by this incredible philanthropist in Boston, Tom White, who at age 63 he meets Paul Farmer 23, going to Harvard medical school. They hook up. Paul starts a clinic in Haiti, he's got multiple clinics in Haiti. He's now gone to Rwanda and is working with the Rwandan government to transform the Rwandan health system. Because of that linkage, there are college students and I know high school students, it's required reading to read that book. So kids are thinking about philanthropy in a different way. They are saying I could change something in the developing world like this guy did. But he needed to be backed by somebody, so the pieces have to go hand in hand. But I think you've got generation thinking early on about how do I give back and what would it mean to my life to give back? I think that's a great thing.

Charlie Rose: Are we down the road looking at something more than a website? Are we looking at a structure and an organization that if this thing gets off the ground in a way that's remarkable, you will need more than a website to do it? Why are you smiling?

Warren Buffett: Well, I think there will be a movement that does grow and probably gets organized in some way. I mean, you can feel that from the 20 or so that have acted. They not only want to be doing what they're doing, they want to carry the message to others.

Charlie Rose: They want to proselytize.

Warren Buffett: They do. And plus there's this aspect about being smart about it. Both maybe in the way you handle the assets to get into the giving stream, and then once it's in the giving stream, how is it handled. Who knows? But they will want to share ideas. And obviously we should help, they should help in setting up some kind of a facility over time that regularly has a -- has a forum for sharing those ideas. And there will be people that have different ideas about where the philanthropy should go. I don't know. I'm not there to judge them. But if they have a good case, let them make it to other people.

Melinda Gates: And I think these four families have said they want to be part of it. They will also start to talk amongst their friends. Once there's an initial group going, I think it will have an energy of its own, and that group will decide exactly how this gets carried out. And it will probably change over time as they learn what works when we get the first group together in the fall and see what really resonates. So that was the idea is just to get the momentum to happen and see what organically comes out of it, but to really get people to say this is the right thing for this group.

Warren Buffett: These people are doers.

Bill Gates: Yes, yes, that was clear.

Warren Buffett: There were no shrinking violets.

Charlie Rose: I want to go back to that, though. Tell me what you heard in these meetings that just touched you.

Bill Gates: Well, people like Chuck Feeney who's given almost everything away. That's quite a phenomenal story. People like Ted Turner who was kind of -- felt he was blazing new ground and wanted other people to do it as well. Then you have people who found needs that were what pulled them in. And they didn't even expect to be pulled in, but the more they knew about the need and the impact they thought, boy, we really should do this thing. And many of them talked about their parents and how proud their parents would be.

Melinda Gates: And I think the other thing that was really touching in one of the dinners is people talked about their children, how do you include them or not. One of the families talked about having an initial target on health and human services as a couple. The kids were just getting into their 20s, but they'd given the kids some money to help them start this out, too, and how the kids have drawn them a slightly different direction of health and human services, and they feel incredible about the kids and what the kids want to do with the money. And they say, look, we're giving as a family, we enjoy doing it together, and when we leave and what's left to give is in the hands of our kids we feel great about how they're doing it, they felt phenomenal about that.

Charlie Rose: Are there things that government should do in order to make this project better?

Bill Gates: I think it's very important that when philanthropy shows something can work, that there's some mechanism through the democracy to have government benefit from the experimentation that philanthropy puts forward -- I think our system in the United States is a mixed system where we have so much philanthropy, the United Way giving to many different causes. We've actually grown soup that government and this NGO sector are kind of complementary to each other. It was interesting. In China everything is the government today. So we're saying to people we should give or what are you thinking about it. They were saying there's not an established set of things to give to. And so maybe these wealthy people in China, partly what they need to do is get that going so that it's very clear here's how to you give to schools. The United States is way down the learning curve on that, and many of those organizations are sported by a mix of philanthropy and the government. So I do think there's a best practice for this country.

Charlie Rose: You may not know these numbers but if anybody does, you would. If you just took the number or the Fortune 400 list of billionaires or whatever the list stops and they would make this pledge -

Warren Buffett: About \$600 billion.

Charlie Rose: \$600 billion.

Warren Buffett: Yes. Yes. I'll settle for \$550 billion.

Charlie Rose: OK, but stay with me. Think about what that could do and think about how much of whatever the nut is that -- the Gates Foundation has today and what percentage you use every year. What are you talking about in terms of annually a contribution to a whole range of things that have a need?

Bill Gates: People give at least five percent because that's the minimum distribution.

Charlie Rose: You have to give five percent.

Bill Gates: You can think about \$30 billion coming out of a number like that, \$30 billion a year is a phenomenal number even if you're splitting it amongst dozens of causes. The catalytic change that would come out of that would be huge. A lot of that would be spent in the United States. Some of it would go outside the United States. And there's fertile territory in both places.

Melinda Gates: And don't forget about foundations pushing on each other and pushing each other's thinking to constantly improve. We've learned from so many people that got early on in the charter school movement or the Broad Foundation in education. We share a lot of goals but they look at it in a slightly different way. Chris Hahn and Jamie Cooper Hahn out of London, they have the Children's Investment Fund. We happen to have hooked up with them on our HIV/ AIDS grants. They have made our grants better by thinking about how we give that money out and how our grandkids use the money.

Charlie Rose: What is that thinking that so influenced you that you think is so important about how to make the grants and to push it out.

Melinda Gates: They might take a problem in a slightly different way and say, OK, you're giving your money in this way, but how does the HIV piece hook up with nutrition? The mother has to eat and feed her baby. You're doing nutrition grants, but are you really thinking about the linkages? And in their case they had gone one step further than we had in their grant making. So we backed up a little bit and said let's look at our grants in that way. You want to have this intellectual discourse when you are both coming at a problem from a slightly different way of thinking about it resources in making sure you're measuring it. We thought they were great at measuring. We found out they were slightly better. We learned from them. That's a great thing.

Warren Buffett: And Charlie, going back to that \$600 billion. There's new wealth being created all the time. So that sets the tone for countless -- we're talking trillions over time. It isn't just a static one-time thing. There will be more coming next year and the year after. and they will look at what people did before. You hope to establish a new norm.

Charlie Rose: Establish a new norm in terms of what's appropriate. How did you settle on 50 percent?

Warren Buffett: We talked about in the that group --

Charlie Rose: That number came out of the group out of the --

Warren Buffett: It's not a maximum. I think there will be some people -- Well, Chuck Feeney already has.

Charlie Rose: Come closer to way beyond 50.

Bill Gates: The sentiment in the discussion was get people in, because once you get in it will be rare that somebody will stop at 50 percent. In a sense if you say to them you give the majority because it's got a clear simple sound to it, and take it from there. If you make that bar of coming in, which does involve thinking about your estate you're your assets and different people around you, so it's not an easy step to take. But once you take that step, our feeling is that the average giving in this group will be far in excess of that 50 percent.

Melinda Gates: Because once you get going and start giving, there's a momentum. That was true for us early on where we thought we knew how much and enjoy it so much we're giving in our lifetime. And I think we'll see that as well.

Charlie Rose: What was the enjoyment?

Melinda Gates: Knowing you can give a child in the chance in the United States to get a great education. And all we're doing is setting them on their way. You're handing them the opportunity, getting them to that starting line where we might have started because our parents could afford a great education.

Bill Gates: There's two ways to look at it. One is the outcome, but it's also the process, because in education you're meeting teachers who are frustrated but care. You're meeting students who have potential that hasn't been realized. And when you sit down with groups like that, you've got a common cause. You're going go after it. Somebody's going to come up with the new ideas. Just the activity of being involved for those who choose to put the time in is everybody bit as stimulating as any piece of business, making money activity.

Charlie Rose: And you believe just in terms of the specifics, and we've talked about this program before you can what you can do in terms of hunger, what you can do in terms of poverty. And if you raise the poverty level it will affect the population question. I mean, the numbers for children -- fatalities in children will stun you. If that can't make you want to make a commitment --

Bill Gates: The fact is that it can be brought down. About nine million children die a year. It's one of many causes, it's one that grabbed me. And there are different things people can do to go after that. And philanthropy will be very catalytic in terms of how quickly we get that down -- the six million, the three million. And think of how much more just the world is. In 1960 that number was 20 million. And now we have a lot more births. So we've made some good progress between philanthropy, science, government, giving. There are problems that appear intractable when put on the right course things can improve a huge amount.

Charlie Rose: Warren, you've made a lot of people rich, you know a lot of people who are rich.

Warren Buffett: I know a lot who aren't in that forum, too. I can add to that a little bit.

Charlie Rose: Do you think there is within those people you know some -- that this ought to resonate and is likely to resonate because you know who they are, you know how they think?

Warren Buffett: I'm positive. Some of them are self-starters on it. The ones earlier in there, many are in their 80s now, and some of them are giving away substantial amounts of money. We're not talking about 50 percent. We're talking 90 percent or 95 percent with these people. And others will join in. I never go out and solicit anybody personally on that, but once they see the existence of this sort of thing and they see some of the people that are mutual friends of ours do it, there's no question more money will come up.

Melinda Gates: And I think over time Warren introduced us to some of those friends over the last 20 years. Again, hearing what they had already done and what the possibilities were if it was education stimulated our thinking. It's knowing that it's possible, I think is what drives a lot of people to say it's doable, I want to do it.

Warren Buffett: Charlie, I have a group of 50 or 60 people who get together every two years. I call it the Graham group after Ben Graham. In 1999 I assigned Bill the talk, the evolution of my philanthropic thinking. I would say in the 42 years we've been doing it, that was probably listened to more carefully and remembered best by the people in that group of any talk we've had in that whole time. I'm sure that affected some of those 58 people in what they did in the subsequent ten or 11 years. Sp of we can get that one talk by Bill --

Charlie Rose: What was it you think that resonated so much?

Warren Buffett: It was logical and emotional story of how somebody fairly young -- how we got to where it was because he didn't start there. And it was compelling. And people were on the edge of their seat. I wish I'd taped it. But I will guarantee you of those 50 or 60 people in the room that listened to that, some of them changed their behavior because of that. And they're glad they did.

Bill Gates: It was even a surprise to me, because I could feel the same dedication, fanaticism, wow, this is how this should be done that I brought to the software world my whole life. That speech was somehow more fun to give than almost any speech I'd given. And what looked to be complicated -- OK, health, it's not a super- complicated thing. It actually can be boiled down to a few metrics like the number of children who survive and a few conditions that caused that and a few things like vaccines you need go after. So it's not necessarily that specific thing, but I think people were surprised that, wow, he doesn't like things that are soft. He doesn't like things that aren't measurable. He's clearly had a lot of positive feedback in his career, and here you can see that shift, and it really was catalytic for me.

Melinda Gates: When Bill was getting ready for the speech we actually took several long walks. To think of how you're going to explain your giving to somebody else is actually pretty tricky. And then after it we took several walks which is how we tend to process together, to say based on that and what we heard in the room, is there anything we want to change about our giving too? That's what so great when you go to somebody else why you've done what you've done and the framework which you're doing it. It ended up being very fun for both of us.

Warren Buffett: And when we met these 20 couples we asked them to do the same thing. They didn't know when they came they were going to be asked, so they had to do it spontaneously, but they rose to the occasion.

Charlie Rose: And the question was what that you asked them?

Warren Buffett: The question I asked them, and everybody answered it, was tell me evolution of your philanthropic thinking. How did you get to where you are now, because you didn't start this way? And they told store stories. It may have been in terms of things personally with their family, or that they struggled for a long time to make their first dollar. But one way or another they each had their journey, and as people listened to those journeys they were affected just like my group was when Bill gave that talk.

Charlie Rose: I think you said once he took the speech more seriously than any speech you had seen him face ever before.

Melinda Gates: In quite some time, yes, in terms of just really stopping and thinking it through deeply, thinking through how he wanted to explain how he'd come to the various pieces of it, yes, definitely.

Charlie Rose: So what we can hope comes out of this in part is back to your point, that people ask themselves to think about how they --

Warren Buffett: Well, Susie was there with me and she said "Why aren't you giving more?"

Charlie Rose: It is a powerful idea, and congratulations and thank you for taking this time to talk about it. The Giving Pledge is the idea. Think about it yourself and think about the idea that had been expressed here, and clearly think about the kinds of things that motivate you. Think about what it is that touches your own heart and what it is that affects your own emotion, because that is where

Warren Buffett (2011)

8/15/2011

Charlie Rose: We are in Omaha, Nebraska, for a conversation with Warren Buffett. Like so many people, I got up this morning in New York and read "The New York Times" editorial page and I found the following column written by him. It is an op-ed which is called "Stop coddling the super rich." Here are some excerpts. "Our leaders have asked for shared sacrifice, but when they did the asking, they spared me. I checked with my mega-rich friends to learn what pain they were expecting, they, too, were left untouched. While the poor and middle-class fight for us in Afghanistan and while most Americans struggle to make ends meet, the mega-rich continue to get our extraordinary tax breaks." Buffett speaks directly to the newly-designated 12-member super committee of Congress outlining the stakes for the country. "Americans are rapidly losing faith in the ability of Congress to deal with our country's fiscal problems. Only action that is immediate, real and very substantial will prevent that doubt from morphing into hopelessness. That feeling can create its own reality." He spoke to spending as well as taxes saying: "Job one for the 12 is to pare down some future promises that even a rich America can't fulfill. Big money must be saved here." And then he turned to his theme of taxes on the rich. "The 12 should then turn to the issue of revenues. I would leave rates for 99.7 percent of taxpayers unchanged and continue the current two percentage-point reduction in the employee contribution to the payroll tax." His argument is specific. "For those making more than \$1 million -- there were 236,883 of them in 2009 -- I would raise rates immediately on taxable income in excess of \$1 million including, of course, dividends and capital gains. And for those who make \$10 million or more-- there were 8,274 in 2009 -- I would suggest an additional increase in rate." So there it is. At a time of great political debate about taxes and spending, one of the richest people in the world looks at his country and says people like him should pay more taxes. Warren Buffett joins me now to talk about his column, the U.S. economy, the global economy, the deficit and the debt and what he thinks we should do about taxes. I am pleased to have another conversation with my friend Warren Buffett. Welcome.

Warren Buffett: Good see you, Charlie.

Charlie Rose: All right. Let me -- this is not a new idea for you.

Warren Buffett: No, it's not a new idea. It's -- I've done this three times in terms of checking in my office and every time I come out to be the low taxpayer but this time I got a little more upset than usual.

Charlie Rose: So you got more upset and decided you wanted to write and express what central idea?

Warren Buffett: Well, we've been hearing about shared sacrifice. And believe me the people out there know what they're talking about on that. I mean there is sacrifice going on all over this country and we're talking about people making sacrifices about the promises that have been made to them in the future on some entitlements. So I decided to look around and see if any of my friends were being affected by shared sacrifice and they, like me, are enjoying these extremely low tax rates and then in the very high percentage of these cases the very rich are paying less in the way of taxes than the people that clean their offices.

Charlie Rose: Between a ten-year-period, the rich -- the rate they were paying has gone down and more of them have much larger taxable income.

Warren Buffett: Yes, well, the IRS publishes statistics. They've done that since 1992. About the top 400 earners in the country -- it's not the same every year. Those earners have had their income since 1992 quintupled. Now, I don't know very many of our listeners that have had their earnings quintupled. During

[More Compilations](#)

that same period, their tax rates have gone down from 29 and a fraction percent overall to 21 and a fraction percent.

Charlie Rose: You are also in favor of spending cuts.

Warren Buffett: We have to, Charlie. I mean we -- we are a very, very, very rich country. We've got close to what -- \$48,000 of GDP per capita. If you told me when I was a kid that that would happen I would have thought you lost your marbles. But we had -- even a rich country has limits and we have promised things that we can't deliver on and that's a mistake. But we're also in the process under-taxing the very rich. What I propose, incidentally, would not touch the taxes of 99.7 percent. I'm talking about three-tenths of one percent of the American public. But the people from a million dollars on up I think should be asked to share in a little of the sacrifice that we're being asked to share in.

Charlie Rose: What's the formula are you looking for?

Warren Buffett: Well, I think -- what really gives the low rates to the very rich like me is the -- is the low tax on dividends and capital gains. If you take these rich people what the IRS singles out, from 1992, they've almost had a tenfold increase in capital gains. They've had a tenfold increase almost in dividends. And those -- those are taxed at 15 percent and there's no payroll tax on it. Now, the payroll tax accounts for almost as much revenue to the government as the income tax. It's close -- \$800 billion plus on payroll taxes last year; about \$900 billion on income taxes. That's where the money comes from in Washington. And they don't get any payroll tax to speak of on my income. I've got my tax return here.

Charlie Rose: We'll take look at them in a moment.

Warren Buffett: And -- and they -- they get -- I get taxed on up to \$100,000. And -- and -- and my super rich friends get taxed up to \$100,000. And that tax hits the people in my office very, very hard. Often they have a spouse working, so they get taxed on up to \$200,000 that payroll tax. And that's at -- this year we've had a waiver of two points but that's normally at 15.3 percent. That alone is higher than the tax rate on capital gains or dividends.

Charlie Rose: You point out that the average tax rate for people in your audience -- in your -- the average rate for people in your office is 36 percent of taxable income.

Warren Buffett: Yes, 36 percent. And nobody's below 33 percent. And incidentally, the lowest income person in the office is higher than the 33 percent. They don't have the low rate. So from 33 percent to 41 percent they range and they average 36 percent and I'm in there with a fat 17.4 percent I think it is.

Charlie Rose: And why is that?

Warren Buffett: Well, taxes -- if you make money with money, you get taxed very -- at very low rates; 15 percent dividends in capital gains. No payroll tax. If you make money with muscle or hard work or sweat of your brow, you get taxed at rates that move on up. And most of the people, the middle-class gets taxed at rates of either 15 percent or 25 percent on their income tax, but then they get really hit hard on the payroll tax and that's what brings the rates in our office up to an average of 36 percent if you leave me out.

Charlie Rose: What has happened to the tax rate for the lowest 20 percent?

Warren Buffett: The poor don't pay any.

Charlie Rose: Right.

Warren Buffett: I mean there -- there's 80 plus million actual taxpayers that pay tax. Incidentally, some of the extremely wealthy don't pay, but that's just an aberration. But no, the taxes -- taxes are falling -- the high rates are falling on the middle-class and the upper middle-class.

Charlie Rose: The argument is sometimes made by people who believe that it is always good economic policy to reduce taxes that if, in fact, you reduce taxes you will create economic expansion and economic growth. People will go out and create jobs if they're not paying as much taxes. People if they're paying a higher tax will not make as many investments.

Warren Buffett: Well, I worked with investors for 60 years, small ones, large ones, super large ones.

Charlie Rose: Yes.

Warren Buffett: I have yet-- and I've worked with capital gains rates of 39.9 percent and 36 percent and 25 percent, I have yet to hear one person say to me "If I call you in the middle of the night Charlie and I say Charlie I've got this hot investment idea." Your reaction is not to say "No matter what the tax rate, forget it, I'm going back to sleep because the capital gains rates are too high." No, what you're going to do is you're going to say, "Tell me the name, quick, Warren, before you change your mind." And you know, I have never had one person decline to invest with me.

Charlie Rose: Yes.

Warren Buffett: And I was running money 40, 50 years ago when rates were much higher and I never had one person to show the slightest reluctance to take an investment idea and run with it.

Charlie Rose: What are the other reasons that for -- that is essential to do now?

Warren Buffett: Well I think it is essential. I think people are very, very upset about how their government works and particularly how it worked during this raising the deficit ceiling period. I mean, so as I talk to people, they're very disillusioned. Howard -- Howard Schultz of Starbucks --

Charlie Rose: Right.

Warren Buffett: -- came out with an article just the other day on that. So I think -- I think it's important that whatever is done restores to a degree -- and we can't do I overnight, but restores to a degree people's faith in the fact that their government can work. And I also think fairness is important and I think getting rid of promises that you can't keep is important. I don't think we should cut spending dramatically now. I don't think that what I'm talking about on taxes solves the -- the deficit gap at all. But I think fairness is important. I think having a sensible long-term plan is important to explain and I think having it be believable is terribly important because people don't believe these out year things generally with Congress. They see too much of what's happened.

Charlie Rose: Is part of this -- being in the position that you're in you want to start a conversation about the reality of taxes.

Warren Buffett: Sure.

Charlie Rose: And the reality of balance and fairness.

Warren Buffett: Yes. I think it's -- I think the American people deserve to be educated on what fellows like me are paying in taxes, for example. But they have to be educated on the reality of future promises. They have to be educated on the necessity of running significant deficits when the economy is weak. I

mean there's a lot of things in terms of economic education. But -- but this is the time to do it. If we don't do it now -- if these 12 members who have been appointed now to the super committee --

Charlie Rose: Yes.

Warren Buffett: -- if they come back with something that's a lot of mush, the American public's had it.

Charlie Rose: And -- and what happens to the country?

Warren Buffett: It isn't good. It isn't good. The country will still come through.

Charlie Rose: Right.

Warren Buffett: Believe me. We can -- we will -- we'll rise to whatever occasions -- the occasion demands eventually. But we are wasting so much in the way of potential output, in terms of the opportunities for people. But we ought to get on with it. I mean the job of government is to govern.

Charlie Rose: Let me go t the debt ceiling debate and just talk about it for a moment.

Warren Buffett: It's just like -- let's -- let's just say, Charlie, that you and I agree that after we left the studio here we were going go out to a track near here and I was going to get at one end with my car and you were going to get at the other end and there's this line down the middle and whichever one flinches loses his net worth to the other guy. Do you want to play?

Charlie Rose: Yes.

Warren Buffett: What do you want to play depends on how crazy you think I am.

Charlie Rose: Yes.

Warren Buffett: So what do we do if we go out there? Your net worth is on the line and my net worth is on the line and the engines are revved up, you know. And I make all these menacing gestures at you. I tried to look like a --

Charlie Rose: You make me think you're crazy.

Warren Buffett: Oh yes, yes, absolutely. Absolutely. And you're trying to make me think I'm -- you're crazy. And we both get in our cars and we don't think the other guy is crazy.

Charlie Rose: Yes.

Warren Buffett: So what do we do? Right as the engines start, I throw out my steering wheel. Now you believe me, right? Well, Boehner didn't throw out the steering wheel, McConnell didn't throw out the steering wheel but a group behind them said "Throw out the steering wheel, Mr. Speaker and make those people realize that we're not going to agree to anything unless we get our way." And -- and if you have a sane person dealing with somebody that you feel may be insane, by that point when they draw the steering wheel you feel they're insane "you lose". And the American people lost, incidentally.

Charlie Rose: Then along came Standard & Poor's and basically downgraded.

Warren Buffett: Yes.

Charlie Rose: -- because they said it appears that the U.S. Congress is dysfunctional and unable to deal with the issue.

Warren Buffett: Yes.

Charlie Rose: You disagree with the downgrading?

Warren Buffett: A 100 percent. I mean --

Charlie Rose: But you understand why they made the decision?

Warren Buffett: Oh I understand why they did it. But I will bet, you McGraw-Hill owns Standard & Poor's.

Charlie Rose: Right.

Warren Buffett: I bet if they have any short-term money around it's in treasuries. I don't know that for sure but they would not be worried about it that being in treasuries.

Charlie Rose: And that's, in fact, what happened the treasuries --

Warren Buffett: The treasuries -- we can print money. There are 17 countries in Europe that gave up the right to print money and believe me, they don't want to give up the right to print money.

Charlie Rose: Because they joined the Euro zone.

Warren Buffett: Yes they joined the Euro zone and now they -- they've got terrible problems because they can't print money. We -- we can print money. We don't -- we don't have to worry so much about our government becoming dysfunctional as we have to worry about that damn printing press becoming dysfunctional.

Charlie Rose: So in fact you are saying that the United States can always pay its bills and therefore it should not have had its AAA rating downgraded?

Warren Buffett: Yes, that's correct.

Charlie Rose: Yes. But what about -- what do you make of the Chinese criticism?

Warren Buffett: Well, I -- I'm sure they're enjoying it in a way.

Charlie Rose: Yes.

Warren Buffett: I mean, they -- well I would criticize too, because if I were the Chinese sitting with a \$1 trillion plus of U.S. government obligations one way or another, I would be very worried about what's going to happen to the purchasing power of that. I mean I've got the right to get the \$1 trillion back and I will get the \$1 trillion back. The question is what will it -- what will it buy at that time? And our government gives you the impression at times that if they will resort to a printing press. They'll resort to a printing press if necessary. And if they do enough of that, the value of the dollar goes down and it goes down significantly. So if you hold a lot of dollars which the Chinese do -- I can see getting unhappy about that.

Charlie Rose: What do you think of the Federal Reserve's announcement they're going to keep interest rates low?

Warren Buffett: Well, that's a very, very stark statement. I mean the fed is saying, when they say we're going to keep the rates low until 2013, that they say -- they're really saying the economy is not going to be very good until then. That's a -- that's -- it's an unusual statement.

Charlie Rose: Would you disagree with it?

Warren Buffett: I -- I think there's a chance they're wrong, yes. I think that -- I think it may pick up before then.

Charlie Rose: Do you think the U.S. economy will pick up before then?

Warren Buffett: Yes, the U.S. economy. I think it's -- well, it's been picking up ever since the summer of 2009. Right up until last month. I mean I -- I -- I see figures on 70 plus businesses. What is unusual about this is we had a huge recession caused in large part by a housing bubble. I mean, you had -- you have 67 percent of the people in the United States own their own homes roughly.

Charlie Rose: Right.

Warren Buffett: And those people who have a \$22 trillion asset at the peak saw the value shrink dramatically. That's -- that's affecting two-thirds of the households in the United States. That had had incredible impact on the economy and we won't come back big time until we've worked off the excess inventory that was created during our binge on housing a few years back. We are -- we are making progress on that every day, every week, every month. I mean, we are producing less houses than we are households.

Charlie Rose: The household formation has to increase beyond --

Warren Buffett: Beyond the housing construction. And that's been happening for a couple of years and it's exactly what should happen. Now, I actually read some article today by people talking about blowing up a few houses or something. If you blew up a million houses you'd probably be in balance now. I'm not advocating that, right. And if you started having households being formed by 12-year-olds you -- you -- you could speed up household formation. But we're not going to have that either. But we are going to have households being formed. That's baked into the demographic pie.

Charlie Rose: You are saying that what's wrong with the American economic growth picture right now is housing and construction --

Warren Buffett: Right.

Charlie Rose: -- and -- and --

Warren Buffett: Every one of our businesses virtually or our 70 something businesses are doing better quarter by quarter by quarter except those tied to housing.

Charlie Rose: Keeps on paying in things like that.

Warren Buffett: But housing -- housing is way bigger than construction workers. Unemployment will fall significantly in my view when we get back up to a million housing starts because it won't just be construction workers, it will be our carpet workers where we've laid off 6,000 people, and it will be our brick workers. And go up and down the line. So the big recovery -- we've recovered our corporate profits. We've recovered in terms of -- of getting the banks back in shape, banks are in good shape now. We've recovered in all kinds of areas. Corporate America is doing fine in most areas. It's not doing fine in things tied to residential construction. That won't come back until we work off the excess inventory. But the inventory is not as -- the amount of excess inventory is not as high as a lot of people think in my judgment and that's why I say it could be before mid-2013.

Charlie Rose: Going down to eight percent or something?

Warren Buffett: And I think it's -- and I think if -- when -- when home construction is a million units or more running at that rate, I think we'll be at seven percent or below.

Charlie Rose: You have a bit -- a bet with Peter Orszag, the former Director of the Office of Management and Budget?

Warren Buffett: Yes, but I'm talking settlement with him.

Charlie Rose: What was the bet?

Warren Buffett: The bet -- the bet was on by election time that it would be down to 7.3 percent and I thought -- I thought housing construction would come back by that point.

Charlie Rose: Yes.

Warren Buffett: And I may be wrong. I may be right but --

Charlie Rose: Yes.

Warren Buffett: -- but when -- I will guarantee you when housing construction gets back to a million units -- and it can go beyond that.

Charlie Rose: Right, right, right.

Warren Buffett: I mean it could even be a million or two, we will have -- and unemployment will fall dramatically.

Charlie Rose: To six percent at some point?

Warren Buffett: Well, certainly below seven percent.

Charlie Rose: Below -- oh, close to six.

Warren Buffett: Yes, yes.

Charlie Rose: By 2013?

Warren Buffett: Oh, I -- I think -- I think it's likely to happen -- the Federal Reserve disagrees with me.

Charlie Rose: Yes.

Warren Buffett: And Bernanke is a lot smarter guy about that than I am. But -- but I -- we are working it off. I mean we have -- we have never had this low a level relative to population --

Charlie Rose: Right.

Warren Buffett: -- for as long as I've known the figures on. I mean this -- this is a huge correction of a bubble that popped.

Charlie Rose: And -- and what is necessary to take place over the next two years in order to increase household formation and decrease the amount of construction?

Warren Buffett: Well, we're doing pretty well on the decrease in construction.

Charlie Rose: Right.

Warren Buffett: We've -- we have not done --

Charlie Rose: Demand is a factor in that.

Warren Buffett: Demand is a factor and we artificially gave it a little boost when we went with the credit a year or two ago on -- on -- on purchase of homes. I think it's a mistake to try and -- to try and front end it. I mean it just delays the eventual recovery. If you've gone in excess of something -- if I've got too many purple dresses and I run a dress shop, I get rid of those purple dresses and -- and then I can start all over again with the dresses that the people want.

Charlie Rose: Yes.

Warren Buffett: And I -- I mark them down to whatever it takes. You could -- you could -- you could have -- you could have a bunch of rich immigrants come in and they'd all need houses, for example. I mean if you wanted to change your immigration policy so that you let 500,000 families in but they have to have a significant net worth and everything, you'd -- you'd solve things very quickly. But naturally it's being solved. Capitalism is solving this. But we're fortunate in doing this, Japan has a declining population. I mean, if they get in excess of something it isn't going to get worked off. We have households being formed every day. I've got a grandson getting married this weekend so we're -- were forming them all the time. And -- and we're forming it a lot faster than we're building homes.

Charlie Rose: And we have an economy that's based on domestic demand.

Warren Buffett: Sure.

Charlie Rose: Yes whereas China was trying to shift around from an export demand to a -- to a domestic demand.

Warren Buffett: Yes, they will be a strong exporter for a long time.

Charlie Rose: When you -- when you look at economic growth first there's a job question but then there's also the rate of economic growth, increase in GDP. How do you see that?

Warren Buffett: I think it will be -- I think it will be very good over time. I mean I -- I -- we have -- we have the same things that have been working for us for 200 plus years. We -- we -- Charlie, I was born on August 30, 1930. That was the high day of the Dow Industrials in that year. It was at 242. They'd come back people thought that they make that we're going to recession.

Charlie Rose: Right, sure.

Warren Buffett: What happened the next couple years? And 4,000 banks closed, the Dow went to 41; that's like the present Dow going to 2,000. My dad lost his job we had the dust bowl here and everything. We're living six times better than now. The American system works. It works terrifically and -- and it has -- it has occasional recessions. I mean we've got -- probably had 15 of them since the country was formed and this was a particularly bad one because we had a bubble in the biggest asset around for the American public.

Charlie Rose: You have made the point that I guess it was in 1779 or somewhere right about then that the Chinese population was like 290 million.

Warren Buffett: Yes, 290 million.

Charlie Rose: The American population was about four million and Europe's was about 50 million.

Warren Buffett: Yes.

Charlie Rose: And look what happened.

Warren Buffett: Look what happened. And we weren't smarter, we didn't work harder, we didn't have greater natural resources, we just had a system that worked and they've been smart enough to catch on.

Charlie Rose: But -- but there are interesting things that are at work as well, the demographics are at work. So they have more domestic demand possibilities in China because of their population or in India because of their population or in Brazil and places like that. Some will argue that it's going to be a much more competitive environment for the United States. While we may have a system, other people are learning from our system and they also have some built-in advantages that we don't have. Yes, they've got -- they've gotten smarter about things. Yes.

Warren Buffett: I mean if you go back 50 years in China, the Chinese were just as smart then. They worked just as hard but they weren't getting results. And now they're -- they're getting incredible results. They -- they picked up on the system but that's not bad for us. I mean we do not -- the world isn't a zero-sum game at all. We want the rest of the world to prosper. We'll sell them a lot of things. You know, most people don't realize it but our exports as a percentage of GDP have doubled in the last 40 years. We have become better at exporting things. But just we -- they import a lot better.

Charlie Rose: Two big debates coming up in terms of this country and the political season. One is about taxes which you are speaking to in this piece. Basically saying, the rich ought to pay more. And the other is the role of government. A debate -- how do you see that debate?

Warren Buffett: Well, I think -- I think if we get back on more or less the formula we had which was getting 18.5 percent or 19 percent of our revenues from taxes, we can spend 21 percent then. We can run a deficit of a couple percent of GDP on average over time because our -- our country will grow and we have a lot more debt capacity than we had back in 1790, just like I've got more paying capacity than I had 50 years ago. So as your income grows, your population grows, your wealth grows you can handle more debt. But you can't let it keep increasing as a percentage of your income or wealth and which is what we've been doing like -- like crazy lately. So I don't mind a couple of percentage point gap; 18.5 percent or 19 percent on revenues, 21 on thereabouts on expenditure but that means we have to hit both sides. And we can't put ourselves on a trajectory that takes the expenditure side up automatically as the years pass, which is what we've done with entitlements.

Charlie Rose: Do we need another stimulus program?

Warren Buffett: Well, we've got to -- we've got the -- we've got the biggest stimulus program the world's seen virtually going on right now. It's very -- that debate has really gotten somewhat ridiculous in my view, because stimulus -- fiscal stimulus is when the government spends a lot more than it's taking in.

Charlie Rose: So the deficit is our stimulus?

Warren Buffett: The deficit is our stimulus. You can -- you can say a bridge someplace is part of that act, you can say cutting taxes is part of it as was the case in our stimulus act. But the stimulus is the government pouring more money out than it's taking in. And we have a -- a stimulus going on that's 10 percent of GDP which we haven't seen since World War II. So we have a huge stimulus going on. Nobody wants to call it a stimulus because that's gotten to be a dirty word. But we have a big stimulus. So we do -- in my view, whether we have a 10 percent of GDP deficit --

Charlie Rose: Right.

Warren Buffett: -- which is a huge stimulus or a 12 percent or eight percent it doesn't make much difference. I -- I think that we pushed monetary policy to a level, we've pushed fiscal policy to the limit but fortunately the most important thing in terms of this country ever coming out of recessions has been the natural workings of capitalism and I think you've seen that for the last couple of years.

Charlie Rose: And you are saying at this table this day you do not see the likelihood of double dip recession because the other thing that needs to happen to make this economy strong as it is, is new construction.

Warren Buffett: Yes.

Charlie Rose: In the housing market.

Warren Buffett: I would say -- I would say there's only -- there's only two things that could cause me to be wrong on that in my view. And -- and I don't think either the way -- is people lose so much faith in government to handle things that they -- that they just -- that they -- they talk themselves into a huge funk in this country. And the second thing could be if somehow the troubles of Europe spilled over here.

Charlie Rose: Confidence is an important thing.

Warren Buffett: Sure it is.

Charlie Rose: And there was a damage to confidence based on what happened in Washington.

Warren Buffett: Charlie, I own stock in a lot of companies. If I get upset about the management, you know, what they're doing, do I lose confidence? Yes. Do I feel bad about investing with them? Yes. I mean -- I mean you -- you want to have -- you've got to have confidence in your leaders. I mean, we went into World War II with confidence in our leaders. I mean, that -- it's vital. It looked like we were losing the war for six months but we never lost confidence in our -- in our leaders. And we -- you have to believe in them and they have to give you a reason to believe in them.

Charlie Rose: Help me understand now what the danger is that we face. If things don't happen as well, if Washington cannot get back on track, maintain the confidence of -- of the American people and at the same time make the right decisions because if that super committee doesn't do the right thing --

Warren Buffett: They ought to do the right thing, yes. With Bernanke --

Charlie Rose: But that's why you tell them -- this is directed in part to that super committee to say, look.

Warren Buffett: Absolutely. You've got to look at taxes really strongly here. If I can pick 12 readers for this, they're the ones. No, if you go back to September of 2008, I mean, you had a month when everything was falling apart -- Freddie, Fannie, hey, you name it.

Charlie Rose: Right.

Warren Buffett: What our leaders were saying to us then, the key players are saying we'll do whatever it takes. And I believed it. I knew they had the power to do whatever it took and I believed they would do it. Now, the problem about government now is that if they come out and get on the Sunday talks shows and say "I'll do whatever it takes", you know, people don't believe them. And I mean, they -- they -- they've got to see action and -- and here they see something like the raising the deficit limit used as a hostage for something of vital importance to the United States. And if you -- you can use it as a hostage in terms of spending, you can use it as a hostage on funding on education or anything else. I mean, it isn't limited about it; if you've got something that comes up like it. People do not want to see the instruments of

government used as weapons the whole idea of the -- of the -- of the law that's a shield not a sword. I mean the minority has become the sword in this respect. And I don't blame this on Speaker Boehner. And I think that he -- I think that he --

Charlie Rose: He had members of the Tea Party --

Warren Buffett: The people that said -- the people when back in the back room said -- said to him, "You're not going to have our support if you go in there and bend an inch on this." They said throw away the steering wheel.

Charlie Rose: You have also said that you guarantee that there was one way to get people to vote differently on this, which is in fact, you say unless you reduce the deficit to --

Warren Buffett: Three percent of GDP.

Charlie Rose: Three percent of

Gdp: Right.

Charlie Rose: Unless you reduce it then you're not eligible for re- election.

Warren Buffett: Yes.

Charlie Rose: If you had that facing them you would get a decision about these issues right away.

Warren Buffett: Tomorrow. But it's still tongue in cheek, though Charlie. Because if you -- during a huge recession like we had during, an all out wartime period you don't want them operating with three percent. I mean, you need larger deficit but you certainly need something a little less than that on average over time. But I just use it to illustrate that this is a world of incentives and we work on incentives in every way. If we work on education, in business, every other place. And what I try to think of the incentives to get somebody who comes up for re-election in a year to do something where the policy cycle goes out five years or ten years, how do you do it when the policy cycle exceeds the electoral cycle? You've got to make sure the electoral cycle is in the equation.

Charlie Rose: What else do you want these 12 members of Congress who are sitting on this super committee to think about? Beyond taxes and a balanced approach which is also what was recommended by Bowles-Simpson, also recommended by the Gang of Six.

Warren Buffett: It's incredible. Here you had Alan Simpson and Erskine Bowles; you couldn't have two finer people. Intelligent, good-humored, on opposite sides of the isle. They get together and they get Tom Coburn and Dick Durbin to sign on to something. And they worked --

Charlie Rose: A Democrat and a Republican --

Warren Buffett: Absolutely, absolutely.

Charlie Rose: -- a liberal Democrat from Illinois and a conservative Republican from Oklahoma.

Warren Buffett: Yes, they were putting the country ahead of their personal feelings and they worked for months and months and months and they criticized. And I'm sure the hours they spent arguing over, given things that they had to compromise on. They get 11 out of 18 to agree and it just gets tossed aside. I think that was a terrible mistake. Simpson-Bowles should gain momentum. When you get people who work like crazy, many months, personal reputations at stake and everything else and you get Coburn and

Durbin, that's -- I give credit to both of them, equal credit. I think -- I may not agree with Tom Coburn but I think that, you know, I think he's a real statesman.

Charlie Rose: A real statesman.

Warren Buffett: I think he's a statesman.

Charlie Rose: And he was, in effect, he was prepared to take reductions in --

Warren Buffett: Absolutely. Absolutely.

Charlie Rose: -- in corporate income tax. There is also this: the President's leadership. You have said, "On most social issues and on distribution of wealth, the President and I are in sync." Yes?

Warren Buffett: Yes.

Charlie Rose: What did you mean by that?

Warren Buffett: Well, I just mean that in terms of a woman's right to choose, in terms of not having the rich get by with lower taxes than the people in their office, there are a bunch of things that I agree with. There's limits to how much you can do in that.

Charlie Rose: What about distribution of wealth?

Warren Buffett: I think in the last 25 years, the Forbes 400 which is different from the (INAUDIBLE) -- the Forbes 400 has gone from a couple of hundred billion of wealth to a \$1.2 trillion or something like that. I mean you've had the income at the top Americans quintuple, top 400 in the last 20 years. This is becoming a nation of haves and have-nots and super-haves. Listen, anybody that makes \$250,000, I don't consider them rich, particularly if they live in New York or L.A. or some place like that.

Charlie Rose: That's why you put the level at a million dollars.

Warren Buffett: Yes. Listen, you want everybody to be able to get ahead in this country and you want to be able to enjoy the fruits of what they do.

Charlie Rose: Do you like being rich?

Warren Buffett: I've been poor; I've been rich. Rich is better.

Charlie Rose: But the idea is that --

Warren Buffett: No, no, it should be a land of opportunity and people that get rich, nobody's going to confiscate everything or anything of the sort but the distribution in this country, the market system has led to extremes. A guy that's wired like me -- I don't have any special status in this world. I'm not a great nurse, a great teacher may be much more valuable to society than I am. I'm wired so I can figure out what things are worth.

Charlie Rose: Allocate capital.

Warren Buffett: Yes. I get super rich and somebody whose adenoids are in a certain arrangement gets rich but television makes a lot of people rich. Lou Gehrig held out for \$25,000 in the late 30s and they benched him. He headed back to the street. He had a long struggle. Television has made the . 230 hitter or the . 240 hitter better than Ted Williams at . 406. So there's a lot of serendipity. We -- everybody in this country owes their good fortune in some way to the rest of the country.

Charlie Rose: This is your 2010 tax return.

Warren Buffett: That's my 2010 tax return.

Charlie Rose: What will I see there?

Warren Buffett: Well, you'll see a lot of income. You'll see total -- you'll see adjusted gross income of about \$62 million. But then I gave -- you're only entitled to deduct 30 percent of your contribution so I've got a charitable carry forward of about \$10 billion, I don't think I'm going to use it up. But then you get to taxable income and I've got \$39.8 million and you get down to tax and I've got \$6.9 million.

Charlie Rose: And this comes to what percent of taxable income?

Warren Buffett: I think it comes to 17 percent.

Charlie Rose: Seventeen percent. And other people in your office are paying an average of --

Warren Buffett: 33 percent to 41 percent. Nobody's below 33 percent. Nobody's below 33 percent. I think that --

Charlie Rose: How much of that has to do with the payroll tax?

Warren Buffett: A lot because they all pay it. I pay it, incidentally, but it's \$15,000 now for me. \$15,300 and it's \$15,300 for all the people in the office pretty much and many of them have spouses where it's another \$15,300 for the spouse. So for some of them it's \$30,000 and that's a lot of money to them. A lot.

Charlie Rose: And you said you want the 12 most important people to read this, the people in Congress or in the super committee. What else can be done to give it play?

Warren Buffett: Well, I hope "The Times" is a launching pad. I think that it's a subject worth serious discussion and I already heard from somebody this morning that they're putting it on Facebook. I never thought of social media as being a way --

Charlie Rose: Get this column on Facebook so it will get a wider and bigger distribution with 600 million.

Warren Buffett: I think that the public is educated on what goes on. I think the representatives will follow through to some extent. I think some members of Congress don't even understand that probably. I invite them to take their own tax return and make the same calculation I did. And incidentally, I don't have a tax shelter. I don't have -- I've never had a tax shelter. I don't do any of that kind of stuff. The Congress has been my tax advisor. I mean, they're taking care of me.

Charlie Rose: You also make the point that in so many corporations that their biggest investment is not in plants and equipment it's in lobbyists in Washington. So therefore they get deductions so that their effective tax rate is also much less whatever the maximum corporate tax rate is.

Warren Buffett: Yes. Well, that's true and they're entitled, incidentally, to try and -- I mean, there's a big rule book up there and if the rule book has flaws in it, the thing to do is change the rule book, not count on everybody to be on the honor system. I mean the rule book is what counts. I'm probably creating a lot of business for lobbyists now because they'll be very busy defending the present situation. But I think it's the rule book that has to be looked at.

Charlie Rose: Do we need tax reform?

Warren Buffett: Yes, I think so but I think I would cure what I wrote about in the "New York Times" this morning first. That's very easy to do.

Charlie Rose: To do those two things?

Warren Buffett: Yes and that doesn't do everything Charlie, but it probably tops -- it would be \$50 billion a year. Now, everyday talks in terms of ten years so it would be \$500 billion over ten years. But this doesn't close the gap. I want to move up toward that 18.5 percent or 19 percent and I hope we'll get a lot of it out of growth. But I think it's kind silly at this point to count entirely on that. And I think we have to move the expenditures down to 21 percent or thereabouts percent.

Charlie Rose: How do you measure President Obama's leadership on this? Because he could have done more to be in support of Simpson-Bowles; he could have been out earlier.

Warren Buffett: I wish he'd been. I wish he had. Both sides were afraid to touch Simpson-Bowles. I mean it's pretty clear. It made too much sense. They didn't want to be associated with it. I would say this. In terms of the deficit limit negotiations when the other guy throws the steering wheel out the window, you have a problem. If you and I get in those cars and I see you throw the steering wheel out, I give up, you win.

Charlie Rose: In fact, when you looked at the Republican debate the other night and they asked them to raise their hand if they were in favor of a level of spending cuts which were --

Warren Buffett: 10 for 1.

Charlie Rose: 10 for 1. And everybody would not go for that.

Warren Buffett: That was pathetic. I mean, listen, I like Republicans. I mean if you got Democrats on some core issue they'd probably do something just as silly. But when they take that attitude they are really saying, you know I want to win this primary. They are saying the country be damned, I want to win this primary.

Charlie Rose: And it means that a certain element of philosophy on taxation has taken control of the public debate within that party.

Warren Buffett: It has particularly in terms of the primary because the primaries push people to extremes. That's one of the problems we have in this country. But they can't believe in their hearts-- all ten of them-- that a 10 for 1 ratio would in some way irreparably harm the country.

Charlie Rose: but you said you're prepared to make -- as I raised earlier in this conversation specific spending cuts in entitlements, changing social security, trying to reduce the cost of health care which is essential.

Warren Buffett: Charlie, on my tax return here, you had George Will on a few days ago. George said he couldn't understand why he was getting social security. Here it is. Social security benefits, \$32,680.

Charlie Rose: You get \$32,000?

Warren Buffett: \$32,680.

Charlie Rose: Right. You don't need it.

Warren Buffett: And a portion of it is tax free. Not a very big portion.

Charlie Rose: So you'd make a means tested? In a second?

Warren Buffett: Oh, I think it's -- I think the idea when we've got this very, very rich family this country a lot of us have troubles. 60 million people live in households where the income is \$21,000 a year or less. And I say to people who say we shouldn't raise taxes just try that for a few weeks. Just try it. I think that when we're going to have to do things that are a little tough on them, I think you have to come after some of us and it shouldn't be social security. It's deposited in my bank account every month without me even knowing about it.

Charlie Rose: Where does this populist instinct in you come from?

Warren Buffett: I was born lucky. I was born the United States of America. The odds were at least 30 to 1 against that. I didn't have anything to do with that. I was born wired for capitalization. I didn't have anything to do that. So here I am. I won the ovarian lottery the day I was born, you know. A lot of people don't. They go off to Afghanistan or fight for us to preserve things for me. When some of my friends complain about their taxes I feel like saying let's continue this conversation on the shore's enormity. Let's just go over there and we'll just talk about this and how terrible your situation is. I really think this country works wonderfully on a market system. We don't want to give it up. Indeed, we have to control that market system in many ways. But it works. It works with the kind of incentives we have. It works with equality of opportunities. It's not perfect. We've tried for it all the time. But the lucky ones still prosper incredibly disproportionately. I'm not for having some kind of a czar in Washington besides what's proper but I do think something that thinks about the 60 million people that are living at \$21,000 a year or less in their household. I think a rich, rich, rich society should think about them a little bit every day.

Charlie Rose: That's the America you believe in.

Warren Buffett: Yes, it is. I think it's the America most people believe in.

Charlie Rose: Are you ok by Dodd-Frank that, in fact, that was their appropriate reform?

Warren Buffett: I haven't read it, Charlie. I think there's two things that are needed to keep the financial system from going crazy. One is keeping some limits on leverage and we didn't do a very job of that last time. And incidentally --

Charlie Rose: Dodd-Frank is devoted to that a little bit, isn't it?

Warren Buffett: Yes, bu Congress, I mean they encouraged huge leverage in Fannie and Freddie. I mean that's where the money was. The second thing is having the proper incentives for people at the top of important financial institutions. We saw institution after institution go to the government and say we're too important to this society that you can't let us fail. So pour in the money, do whatever's necessary and I'm going go off and be rich. I'm the guy that screwed it up. I think you've got to have down side, really drastic down side for the people that run financial institutions, big ones, that get into trouble. And we need those incentives and I don't think they've attacked that yet. That can be done through the board of directors.

Charlie Rose: Too big to fail continues to exist.

Warren Buffett: Too big to fail will always exist. There will always be institutions that are too big to fail. They're deciding over in Europe that Greece is too big to fail.

Charlie Rose: Ok. But could they be broken up. I know that. Should those institutions be broken up?

Warren Buffett: No, no, no.

Charlie Rose: As one federal -- former federal reserve --

Warren Buffett: No, we decided the whole banking system was too big to fail when we put in the FDIC in effect. We can't exist without them. So we have to do something to change the behavior of people that are at the top of those institutions so they have huge downsides. They didn't have down side. I'm not going to name names but those people did not have down side. They had down side to their reputation but they walked away with tens of millions of dollars so you can't that have that situation exist and expect great behavior. And then you have to have some restrictions on leverage.

Charlie Rose: But has that changed?

Warren Buffett: The incentives have not changed very much. They say they've changed by paying them more stock and all that. But that isn't draconian enough for me.

Charlie Rose: I want to come back to Omaha.

Warren Buffett: Great.

Charlie Rose: And look at what the lessons of Berkshire Hathaway are, for you. I mean most of your businesses have grown.

Warren Buffett: Yes.

Charlie Rose: The railroad's grown.

Warren Buffett: Everything's growing.

Charlie Rose: Everything's growing.

Warren Buffett: Pretty much.

Charlie Rose: You are finding that you need to hire new people.

Warren Buffett: Sure. We're investing a record \$7 billion this year in capital investment, almost all of which is in the United States. That's at least a billion more than we've ever invested in the past. There's plenty of things to do here.

Charlie Rose: You have often said that in a time like this in which there are difficult times, that's the best time for you because you can have more opportunities to buy things that you think are of quality at better prices.

Warren Buffett: There's no question about that. It's like buying on sale. Last Monday we spent more money in the stock market buying than any day this year. But it was --

Charlie Rose: Buying stock.

Warren Buffett: Right. Not business. But buying business is very infrequent. There's a lot of happenstance in that but you have to be ready to do it.

Charlie Rose: There's much discussion in the paper about buying another acquisition of Transatlantic, I think it is -- an insurance company.

Warren Buffett: Yes. We made an offer about a week ago. That offer is expired now. We don't leave things out.

Charlie Rose: You don't like bidding wars, either.

Warren Buffett: No, no.

Charlie Rose: But if you look at Berkshire today it's different the sense that more of it is owning businesses 100 percent than it is owning stock.

Warren Buffett: Yes. And we've been going that direction for 20 years but people are seeing more and more evidence of it but we employ 260,000 people or more and we have added to employment this year.

Charlie Rose: With the exception of homes and construction and carpet and all those --

Warren Buffett: Everything is --

Charlie Rose: The second largest real estate agent and all that.

Warren Buffett: Yes.

Charlie Rose: And that's the one thing -- So Berkshire in a sense offers an opportunity to look at where U.S. economic growth is.

Warren Buffett: I can tell you how many people had Dilley Bars yesterday. Everything from Dilley Bars to corporate aircraft.

Charlie Rose: Robert Zoellick, the President of the World Bank said this is a very, very, internationally is a difficult time and because what's happening in the United States and in Europe could very well be a warning sign. You seem to say, look, my success of my companies is different except for construction.

Warren Buffett: The United States has been improving. I mean, it went through -- we talked about it, it was economic Pearl Harbor.

Charlie Rose: Right.

Warren Buffett: I mean, I use that term. And we had a shock to our system that was really colossal and if a few people hadn't acted right, even more so. But we have been coming back steadily. The mood has gone up and down more like this as we've gone but everything I see in business, we've been coming back steadily since the summer of 2009 and continuing up through last month. Now can something happen that will interrupt that? Perhaps, but I haven't seen it. Europe is a different story.

Charlie Rose: Ok. Put Europe in the context of this, though. How could the sovereign debt crisis in Europe affect the rest of us?

Warren Buffett: Well, the problem is I don't know. I -- I don't know -- I don't know what's going to happen over there. I know 17 countries that joined the European monetary union gave up the right to print their own money. That was a huge, huge decision. I hope the United States never does it. I mean it changes the game --

Charlie Rose: To be in control of your own finances, in fact.

Warren Buffett: Yes. And they linked themselves. They gave each other their credit cards and said let's all go out. And some behaved better than others or worse than others.

Charlie Rose: Should they dismantle the Euro Zone then?

Warren Buffett: I don't know. I mean it's very complicated. You have to decide one or two things. You've either got to decide that these members are actually going to get their act together, the ones that have troubles in a very major way because they need lots of money. They have to refund their old obligations all the time. So nobody has to lend money to country a, b, or c. Nobody has to lend money to them. The United States, nobody lends money to the United States, we print it. But not over there. If Greece owed their money in drachma they'd have a lot of inflation and, you know, devalue and all of that. But they wouldn't have a problem paying their bonds. They gave up that right. Now, either the weaker countries get their act together in some major way -- and I think that's very, very difficult -- or basically the very strong companies, and we're talking countries -- we're talking Germany, have to say I'm willing to take care of my brother-in-law that's been using my credit card.

Charlie Rose: That's what they've said so far.

Warren Buffett: Well, they sort of half said it. I mean that's their problem. If you're having a run at a bank and you've got 10 people in front of it and no FDIC insurance that line isn't going to stay at 10. You're either going to get rid of those 10 or you're going to have a hundred. And so far, in Europe they've sort of kept talking to the 10 and a few more straggled up and so they didn't get rid of the line and when then there's a run the line only gets longer unless it gets taken care of very quickly.

Charlie Rose: But what are the consequences for the United States and for Asia?

Warren Buffett: I don't -- I don't know the answer to that. I don't think they're necessarily extremely dire. There have got to be consequences but I don't -- Europe won't go away. We're selling a lot of goods in Europe.

Charlie Rose: It is a huge market.

Warren Buffett: Yes. It's a huge market. And they're not going to go away and the plants aren't going to go away and the farmland isn't going to go away. It's just going to be kind of an economic mess for a while.

Charlie Rose: You have said before to me and to others that Berkshire is your canvass that you paint on. It's your masterpiece.

Warren Buffett: Well, I don't know about masterpiece, but canvass.

Charlie Rose: So what is it if you look at it today, Berkshire, you find fault with?

Warren Buffett: Find fault with?

Charlie Rose: Yes.

Warren Buffett: Well, I've made plenty of mistakes along the way so I have a lot of brush strokes just give me a little whatever things to remove that I would do it. So I've made mistake, but I expect to make mistakes and I'll keep making mistakes.

Charlie Rose: Because unless you take chances you won't make mistakes.

Warren Buffett: Oh sure and mistakes are part of the game. I mean you're swinging at pitches and -- I don't want to sound -- I feel good about Berkshire. I mean, the people I'm associated with at businesses, we have a -- we lay out our economic principles and I laid them out many, many years ago. And we don't

change them. I mean we try to operate that way. Doesn't mean we're perfection. You've got a company of 260,000 people, I'll guarantee you right now somebody's doing something I wish they weren't. You can't have a city of 260,000 people and have no jails. But overall I feel there's a culture that I don't think any other large -- any large public company has and I think it's enduring because it's so inculcated and the manager, the shareholders, the directors, everybody. So I feel that about Berkshire.

Charlie Rose: Would I be wrong to suggest the thing you worry most about is whether after you are gone that that culture remains as it is? That you have in a sense made Berkshire strong enough to exist without you?

Warren Buffett: Yes, I don't worry about that. I worried about it over the years, which is why I did a bunch of things that I think ensure that future. But that's always the question. You've seen all kinds of great companies topple from --

Charlie Rose: You once said to me and to others you have to make your company idiot proof because at some point some idiot will run it.

Warren Buffett: Yes. Well, that may be even the case now.

Charlie Rose: Someone has said I think that the thing you worry most about is whether Berkshire will be intact 20 years after you're gone.

Warren Buffett: I don't worry about it, but I care about it. And since care about it I put things in place which I think almost ensure that Berkshire will be a lot better 20 years after I gone than it is now.

Charlie Rose: Where is succession today?

Warren Buffett: Where is succession?

Charlie Rose: yes.

Warren Buffett: If I die tonight tomorrow morning it won't take the board an hour to announce my --

Charlie Rose: Who the CEO is?

Warren Buffett: Absolutely. They know exactly who it is and they agree.

Charlie Rose: But it may change six months from now.

Warren Buffett: It's unlikely to change six months from now. But it could. I mean that person could die.

Charlie Rose: Is there a list of people or one person?

Warren Buffett: No. There's several people but there's one person they've all agreed on.

Charlie Rose: Takes over as CEO.

Warren Buffett: Yes. And there should be. I mean, there's no reason to have the board of directors start thinking about who the CEO should be the day after the present CEO leave. I mean they've neglected their job if they do that.

Charlie Rose: Was the Sokol affair the thing that caused you most angst because it had to do with judgment of --

Warren Buffett: Well, it caused angst. I don't know whether it's the most in my business life but it was up there.

Charlie Rose: When you think about whatever legacy there is, your legacy is Berkshire Hathaway beyond family and philanthropy.

Warren Buffett: Yes, well it's -- I'll settle for those.

Charlie Rose: You quoted Sir Christopher Wren who I think, created St. Paul's Cathedral --

Warren Buffett: That's right. He's buried there too.

Charlie Rose: And if you go there the epitaph he has written for himself is?

Warren Buffett: I'll paraphrase it there a little bit. "If you seek my monument, look about you." And I say that should be the -- That's the way we should think about this country. I mean this country a monument to what was done a few years ago and the people that have followed. It's incredible. Just think if you would. Back in 1790 you said I want to create a monument to this new country I'm giving you and you'd envision the country of 2011. I don't think anybody would have dreamt big enough. I mean this is something that -- so I just -- When I fly across the country that thought occurs to me that if you really seek this country's monument, if you seek our founding fathers monument, just look around you.

Charlie Rose: And you worry today that there's some threat to that. Not because the system is not right, not because the system is not strong enough but you worry that there are things happening that will make it less great if they are not addressed.

Warren Buffett: Right. I think we're being tested, Charlie, yes. But we were tested in the Civil War. We were tested in the Depression. We were tested December 7 of '41. We were tested on September 11th of 2001. We will get tests. And this is one of them. We will surmount them but I would just as soon get on with

Warren Buffett (2011)

9/30/2011

Charlie Rose: Over the 20 years there have been no guests that have been more interesting and more eagerly anticipated than Warren Buffett. His is a fascinating story. His is a name that is known throughout the world for his extraordinary success as an investor and the parallel success of his company, Berkshire Hathaway. He has been in the news recently because he made a major investment in Bank of America. He also announced a stock buyback of Berkshire Hathaway shares. Perhaps the sharpest focus recently has been on his announcement that wealthy people should pay for taxes. President Obama was certainly listening because he included it in his list of tax law recommendations. He called it the "Buffett Rule". Warren Buffett is in New York and we're pleased to have him at this table not only because he has been such a wonderful guest for us, but also because he is a friend of mine. Welcome.

Warren Buffett: Thank you, Charlie.

Charlie Rose: You've announced recently you're going to buy back, or started the process of buying back Berkshire Hathaway shares. Some people were surprised because you had written in your stockholders letter, which is now famous, "I don't do that."

Warren Buffett: Well, I haven't said that. I have said that you should buy back your shares only when you think they're selling at a discount to their intrinsic value. And since intrinsic value is not a precise figure, it's a guess.

Charlie Rose: Part of the reason you said that was because you don't necessarily think that people buy back shares simply to improve the stock performance.

Warren Buffett: Sometimes they are trying to prop their stock. Sometimes they're -- who knows what their motivations are. There's only one motivation for me. If I think I'm buying our businesses at a discount, I think then it helps all the shareholders. Now I also think you should tell the people before you do that. Just like if you are my partner, and I want to buy -- you want to sell out, if I think I'm buying it from you too cheap I ought to tell you that. Now with the stock exchange it sets the price. And every now and then -- it happened about 10 or 11 years ago, I thought Berkshire Hathaway stock was selling demonstrably below the value of its businesses. And we announced we were going to possibly do it 10 or 11 years ago and then the stock went up right --

Charlie Rose: Right -- so you didn't do it.

Warren Buffett: But this time, if the market is weak, we could buy a lot of stock. But what I say is we'll buy the stock if we think we are doing a favor for the people who are staying in the boat.

Charlie Rose: Because you think intrinsic value of your businesses, those that make up Berkshire Hathaway is undervalued.

Warren Buffett: It's higher than the price. It's clearly higher than the price. I mean it's not a precise figure but it's clearly higher than the price.

Charlie Rose: You offered book value plus 10 percent.

Warren Buffett: I said that is the limit of what we will pay. The market will determine what we pay. Yes. So I mean if the market tanked, you know, next week we'll say, Berkshire could be a lot cheaper than that. And you know, I'm not propping the price in any way. But I'm just setting the outer limits of what we will

pay. Because above that, I probably still think it's cheap but I don't-- I want to be demonstrably cheap. I want to be doing the shareholders a favor by buying -- the shareholders who remain a favor by buying in the stock, that they are getting.

Charlie Rose: So you have what, \$47 billion to \$50 billion of cash.

Warren Buffett: It's down some. We've spent some, Charlie. But we have plenty of cash we'll put it that way.

Charlie Rose: Is there a limit of how much you always want to have in reserve --

Warren Buffett: Yes.

Charlie Rose: -- in case an incredible opportunity comes up and you can go do it.

Warren Buffett: Yes. We won't go below \$20 billion in consolidated cash.

Charlie Rose: Cash, yes. So you could be prepared it to spend more than

Warren Buffett: Yes. \$20 billion to buy back your stock. We can spend a lot of money depending on how long -- over how long a period because we're earning money all the time. And as we earn money, the money comes in. There's no time limit on it, there is no dollar amount limit on it. There is this limit in terms of valuation and there is this limit in terms of maintaining a given level of cash.

Charlie Rose: It is said that some people think that the asset value of Berkshire Hathaway is close to \$130 to \$150 a share for the Class A stock.

Warren Buffett: Yes, closer to \$130,000.

Charlie Rose: Right. Of course, \$130,000.

Warren Buffett: I don't know what the number is. I know it's -- I know it's more than 110 percent of the book. I mean we've got some wonderful businesses. We're got some that aren't so wonderful. But some of the big ones, particularly are really very, very good businesses. And they're worth a lot more than they were when we bought them.

Charlie Rose: Why don't you sell those that are not so wonderful.

Warren Buffett: I just don't do it. I don't do it. If I have ten kids, one of them is a little slow -- I'm not going to put him up for adoption.

Charlie Rose: So that is the way you feel about these businesses.

Warren Buffett: I do. Unless they promise to have permanent losses over time or unless they have major labor problems and I put that in my annual report for 30 years. I just, people come to me to sell their business to me. They work hard for me after they sell their businesses, you know. Everything doesn't work out perfectly in life. And I'm not about to dump somebody because, you know, it's If it is a disaster, we have to get out of it. sub-par.

Charlie Rose: This is a signal from the Sage of Omaha that there are not a lot of investment opportunities out there.

Warren Buffett: Well, both segments are wrong. We actually -- we got the paperwork cleared, I guess, just yesterday morning.

Charlie Rose: So the process is --

Warren Buffett: So we actually bought some shares. Now whether we buy a lot of shares or not will depend on the price. But we intend to buy shares, if the parameters we laid out are correct. It has nothing to do with what-- you know, if I live to be 100 and keep my marbles, I hope I'm still around.

Charlie Rose: Well, in fact, in the last quarter didn't you spend about \$4 billion on stock -- common stock?

Warren Buffett: No. In this, actually, yes, September 30th being the current quarter. The third quarter we spent a net of \$4 billion, roughly.

Charlie Rose: And it's been about \$8 billion so far this year in terms of --

Warren Buffett: That's about right.

Charlie Rose: -- of buying common stock.

Warren Buffett: That's almost exactly right.

Charlie Rose: Which suggests you are buying stock because you believe in America and you believe in these companies and you believe --

Warren Buffett: They are American companies. And they do business, some, a fair amount abroad but they are American companies. And incidentally, we are investing \$7 billion --

Charlie Rose: You make that point. In terms of infrastructure and --

Warren Buffett: When we buy stock, our own stock back, we're intensifying our interest in a whole bunch of mostly American companies. Our shareholders will own a greater percentage BNSF, (INAUDIBLE), a greater percentage of Geico if we buy back shares. The pie will be as big but there won't be as many slices.

Charlie Rose: Here is what George Soros told CNBC last week. That he said, "Rather than the U.S. slipping into recession sometimes in the future, I think we are already in it." Michael Spence and Paul Krugman said there was 50 percent chance of another recession. You don't buy that.

Warren Buffett: I don't buy it. I'm looking at 70 some companies and I will tell you that a railroad carried 193,000 cars last week. And I can tell you in terms of caddie sales and jewelry sales -- we've got three different jewelry operations, four different furniture operations.

Charlie Rose: They're all up.

Warren Buffett: Yes, they're not galloping but there has been no downturn. There has been no downturn, you know. Except I told you before, home construction is flat on its rear.

Charlie Rose: When is it going to turn around?

Warren Buffett: It's going turn around when we've created enough more households than houses that the inventory of houses gets down to --

Charlie Rose: Is there a magical way to do that, to create more inventory than --

Warren Buffett: Well, the way to do it is to hold down creation of new houses. We have about 500,000 plus housing starts going on, that counts apartments as well.

Charlie Rose: So the way to do it is stop the supply and limit the supply.

Warren Buffett: If we create more households than houses, we will bring the inventory into balance. I don't know when but we did just the opposite six or seven years ago. We created more houses than household. Surprise, we had too many houses. It is really, it is really a question of supply and demand. And we created too many houses relative to households. A few years back, now we're creating more households every day than we are houses and we will come back into balance. I don't know when that will be. But when it happens, you know, when we get back to a million units a year, or something like that, I think will you see unemployment rates drop significantly.

Charlie Rose: Perhaps down to 6 percent.

Warren Buffett: Yes.

Charlie Rose: And you will see the full economic recovery at that time.

Warren Buffett: You will see -- you'll certainly see something very close -- much closer to it.

Charlie Rose: Do you believe it will get back to where it was prior to 2008?

Warren Buffett: Well, to some extent --

Charlie Rose: Both economic growth and --

Warren Buffett: We had an unsustainable binge because we were creating -- among other things creating too many houses and selling them to people without couldn't pay for them and all of that. So we were-- we were in the bar drinking, you know. I'm not sure we want to go all the way back in but we want to get over the hangover.

Charlie Rose: But at the same time you recently made a significant investment in Bank of America.

Warren Buffett: Correct.

Charlie Rose: And some say that part of the reason that they are having a difficult time is because of the amount of the mortgage lending that they are responsible for.

Warren Buffett: They made a lot of mistakes during the binge as did a number of other financial institutions. You know, including the two run by the federal government, Fannie Mae and Freddie Mac. But they made mistakes. You know, I made mistakes. And the present management is paying the price and unwinding some of the sins of a previous management. And that takes a lot of time. And it's not done yet and it will take them a lot of time. But that doesn't bother me.

Charlie Rose: No.

Warren Buffett: You know, that's just part of business. You do some dumb things and then you work your way out of them.

Charlie Rose: Time has been your best friend, hasn't it?

Warren Buffett: Well, time, yes, right. I try to, you know, Geico got in trouble in the mid-70s. American Express got in trouble in the mid-60s. Those are two of the greatest investments I've ever had. And you had to look out five or ten years and say-- and that's what you have to do with the economy, incidentally. I mean we have a wonderful economy in the United States over time. And it will come back just like Geico came back, American Express came back. Bank of America worked its way through its troubles. It will be

painful. There will be lots of headlines for a long time. You can't do it in three months or six months. But you have a fellow working at it. He didn't create the problems; he's working on solving them.

Charlie Rose: Brian Moynihan.

Warren Buffett: Yes, Brian Moynihan and you have a very, very fine business underneath.

Charlie Rose: One of the arguments between Republicans and Democrats in this upcoming political battle is going to be the balance between spending cuts which help treat (ph) deficit in part and a growth strategy that builds towards a future. How do you figure out where you ought to be on that?

Warren Buffett: Well, there's -- we will get growth in the future. I mean you've got American genius, genius of capitalism working, to create growth over time. I mean that is not primarily a function of -- a lot of times they talk about growth when they mean to create inflation. And so I don't worry about the United States growing per capita GDP over time. We'll have periodic recessions. This was a particularly strong one because it was a particularly wild binge. I mean it was something and we're paying for it.

Charlie Rose: Do we need something to stimulate the economy to create growth either on the part of the federal government or on the part of the Federal Reserve?

Warren Buffett: Well, we've been stimulating like crazy, you know. We've been running a deficit close to 10 percent in that period of GDP annually. That's a lot of stimulus. I mean it doesn't mean (INAUDIBLE) called the Stimulus Bill. It is stimulus. And we have given monetary policy, you know, we put our foot to the floor and driven interest rates to zero and piled up reserves at the Fed. So --

Charlie Rose: But there is some debate within the Fed as to what might be done and where the focus will be.

Warren Buffett: I don't think that will be too important. I mean the important thing is what the Fed did three years ago. I mean if they played it wrong, then we would be paying a huge price for that. But they've used up most of their bullets. The chairman will probably disagree with me. But in my opinion, monetary policy has been played out about as far as it can. And it's been useful but I don't think there's a lot to be done there that's going to change the course of business recovery.

Charlie Rose: And he thinks there are few things can do that he still has in his --

Warren Buffett: He is doing this operation twist and trying to bring down longer rates. We've got low rates. I mean interest rates are not the problem in the economy now, and short rates are nothing and long rates are pretty darn cheap. So I don't think anything further than that direction is going to have a big impact on the economy.

Charlie Rose: I just talked to some Chinese business people, who were in Washington to meet the Secretary of State and Secretary of Treasury and they came to the table in Washington. And they were a bit worried about inflation in China.

Warren Buffett: Yes, well, you know, they'll have some. And they may have a lot sometime. I mean any economy that, well, look at what we've had over the years. I mean a dollar, when I was born, is worth about 6 cents now. So we've had a lot of inflation, you know, it's something in the area of 15 to 1 since I was born. If you had told my dad that in 1930, I'm not sure he would have had me. I mean he would have thought that the world would come to an end. And things have turned out pretty well. During that same period real GDP per capita has gone up 6 for 1. So I'm against inflation-- I'm for temporary inflation, but when you have a booming economy, you know, you may well get some and sometimes it may get out of

control and sometimes you have to do something about it. But most of these things aren't the end of the world, Charlie, we always think they are the end of the world. But you know, as I mentioned before when I was born on August 30th, 1930 that was the high date for the Dow for the whole year, 242. It went straight down to 41. I mean my mother must have felt guilty as hell, witnessing what had happened.

Charlie Rose: Little did she know.

Warren Buffett: But you know, 25 percent unemployment, all kinds of things. This country comes back. It came back from, you know, what happened at Pearl Harbor. It comes back from all kinds of things. And it's coming back now.

Charlie Rose: So what role would the "Buffett Rule" play in that coming back?

Warren Buffett: Well, I think that it's very important in terms of -- in terms of getting people to make the kind of sacrifices they're going to face. I mean we're going to be telling people that some of the promises have to be modified. And these are people that don't have lots of margins of safety in their own affairs. They're not like me. They can't just sell a few stocks or something like that, if the payment doesn't come through for this or that. So we're going to be asking the American public as a whole to participate in a belt-tightening when we bring down expenditures from 25 percent of GDP or thereabouts. And I think that when you have a very, very small group of ultra rich people who have incomes of a million dollars or more, who are paying very low rates like I am, 17 percent in my case. But I have a number of friends -- I have talked to a lot of people in the last few months. And a number of them are below my 17 percent even though they are in this -- some of them are in this famous 400 category, their average is \$220-some million of income per person. That is some kind of income, isn't it?

Charlie Rose: It is because there have been -- they pay capital gains rate, is that the primary reason?

Warren Buffett: Yes. That is a lot of it.

Charlie Rose: That is 15 percent.

Warren Buffett: Yes, that's the big one but dividends are 15 percent.

Charlie Rose: Right.

Warren Buffett: And they, the ultra rich who are paying really subnormal taxes, and there's a lot of them. But there is a lot of them that aren't.

Charlie Rose: Right.

Warren Buffett: But there are a lot of them that are, I think can best-- I think it's a terrible mistake to ask 300 million Americans to tighten their belt and ignore that group.

Charlie Rose: But here's my point. Is it because of the economic value of doing that per se in terms of the more revenue going into the IRS or is it because the essential fairness of the American system is an important point? If you are asking the population at large, you have to make damn sure they think that the country is operating out of a sense of fairness.

Warren Buffett: Yes. It's both. But it's the second point I think is more important than the first point. Because I would estimate there might be 20, if you put a minimum tax in it would affect a portion of the ultra rich (INAUDIBLE). That might raise \$20 billion a year by some rough estimates. I don't think those are crazy estimates. Now \$20 billion a year seems like a drop in the bucket when you have a deficit of a trillion or so. But \$20 billion a year is still \$1,000 each for 20 million families. I mean and you've got to

get the revenue someplace. So one way or another, I mean who knows how they are going to ask everybody to sacrifice. But if you have a choice between asking 20 million families to come up with another \$1,000 each, or hitting 50,000 or so people who are paying very subnormal taxes, on very large incomes, I would say that, you know, I would rather get the \$20 billion from the people that are like me.

Charlie Rose: And when John Boehner says that the President, when he buys this idea is practicing class warfare?

Warren Buffett: Yes, well, the class warfare has been going on. I mean if you look at these 400 top incomes that have gone from \$40 million on average per person -- per family up to \$200 million, their tax rate has gone from 29 percent and a fraction down to 21 percent so there has been class warfare going on. It's just that my class is winning. And my class isn't just winning, I mean we're killing them. It's been a rout.

Charlie Rose: You've got everything on the board.

Warren Buffett: Well, just look at America today, I mean in terms of the ultra rich. They have not suffered through this. Listen -- and incidentally, if somebody is making \$5 million or \$10 million dollars a year; \$20 million, \$30 million dollars a year as a CEO or athlete or whatever it may be, and they're paying the normal tax rate, you know. They are in the mid 30s or something like that. I have become convinced after talking to a lot of the superrich who talk to me about this, that the best way to do it is this minimum tax of making sure that everybody at those levels, million and over, is paying in the mid 30s.

Charlie Rose: How many people will be affected by this, if you use the million-dollar as the point of reference? Because is it everybody that makes more than a million dollars?

Warren Buffett: No.

Charlie Rose: Or is it a select group.

Warren Buffett: No, there are two ways of going at it. One is to do it by rate in which case the whole group would be affected. It would be about 250,000, just raise the thing five points or something like that. I have -- and that's, that's an acceptable way to go at it. I have talked to a lot of very rich people and I think the fairer way of doing it is to take the people that have found ways to bring their rate down to the 15 percent or 17 in my case, some of them I know are below 10, and just have a minimum tax for them. That would hit about 50,000 in my guess. And I don't have any great figures on it, it might be 70,000, it might be 40,000 but it won't be 10,000. It won't be the whole group; might hit 50,000 out of the 250,000. And they would be brought up into the 30s in terms of their tax rate overall.

Charlie Rose: So what percentage of your income is taxed at 15 percent or 17 percent?

Warren Buffett: A lot.

Charlie Rose: Because you have some ordinary income. You pay yourself \$100,000 a year or something like that.

Warren Buffett: Yes. And I have some interest and that sort of thing. But --

Charlie Rose: That's a small percentage of your income.

Warren Buffett: It depends on the year, Charlie. There have been some years -- there were years a few years back, for example, when I made a lot of money out of owning Freddie Mac and Fannie Mae mortgage pass-throughs. And I got a lot of interest income on that but I also ended up making a very large

capital gain on it. And incidentally that money had not been taxed before, at some corporate level. I read these arguments about that, and didn't apply at all. I made a lot of money a few years back off a bunch of little Korean stocks -- I may have even mentioned that to you. And those companies did not pay any U.S. income tax.

Charlie Rose: What do you think of this idea that you need to change and have tax reform because if you do companies will start bringing money back in that they're withholding overseas and doing something with it overseas and not bringing it back here because they think they're double taxed.

Warren Buffett: Well, there's -- they would like to be able to repatriate money.

Charlie Rose: Right.

Warren Buffett: That was taxed at very low rates in some various places around the globe some sort of legitimate in terms of where they manufacture, sometimes sort of artificial. And they would like to bring that back as they were allowed to do, I don't know, five or six or seven years ago where there was a one-time repatriation. But we own stock in some of those companies incidentally, that have a lot of money that they would call trapped over there. If they are allowed to bring it back and pay very little tax on it. Where do think they're going to -- they are going to want to keep earning money over there.

Charlie Rose: So you don't think they'll bring it back.

Warren Buffett: Well, I think they'll bring it -- if they were allowed to do it without paying any tax to speak or a 5 percent tax, they can bring it back. But they say that would wonderful, because we would be bringing this money back to the United States --

Charlie Rose: And investing.

Warren Buffett: But what it would mean is it would mean, my God, we can earn a lot of money over there at 5 or 10 percent tax rates, let's keep bringing it back. We ought to keep trying to make more money over there and build more plants over there. So it cuts both ways. It is an incentive, if you come up with a low repatriation rate. It's an incentive for people to try and put more of their production and make more money abroad because that brings down their overall tax rate.

Charlie Rose: Corporate America is sitting on a lot of cash and they say there are a couple of reasons for that. Number one they say it's because of regulations and they don't have confidence in what the stocks, what the tax structure is going to look like. Do you believe that?

Warren Buffett: No. I believe that they can't find good projects that they like and that they don't see the demand for certain things. I'm not going to build more carpet mills or something like that or more brick plants if I don't see where I'm going to sell the carpet or bricks.

Charlie Rose: We're not just talking about people who are tied to the housing industry. We're talking about whole lot of corporations in America that are sitting on a lot of cash and they say they don't have confidence in the future and that's why they do it. And you say what.

Warren Buffett: Well, I've got a lot of confidence. They ought to have confidence. They're earning very good returns in most cases on tangible net assets. American business is doing fine.

Charlie Rose: It could be a lot better off if they were investing money and being able to hire new people.

Warren Buffett: Yes, but they have to find the right projects. And to their credit, I would say that I don't know of any companies that see intelligent things to do with the money whether it's here or abroad, and that have the money that are sitting there and not doing it.

Charlie Rose: Ok, so you are basically saying that the problem with the American economy right now is corporate America which creates private jobs is not seeing a lot of intelligent things to do with the money.

Warren Buffett: Yes, there's a lack of demand.

Charlie Rose: What does that say?

Warren Buffett: Well, Keynes would say it was me. But I haven't -- it can't be -- he would say you got to stimulate a lot more because only government can --

Charlie Rose: Paul Krugman says that.

Warren Buffett: Yes. Right. And they may be right but we've done a lot of that. We've already seen a lot of that. So I -- it would have some effect in my view but I think the efficacy of it, once are you off the stimulus of 10 percent of

Gdp To Start With: Do you think the absence of that kind of demand and intelligent opportunity to spend the money is in part because of the Administration has been in charge that owns this economy now?

Warren Buffett: I think it's -- I think it's a function of coming back from a brutal -- we talked about the patient in the hospital. We had an incredible bubble. I mean it manifested in all kinds of ways. -- focused around housing. I mean, you know, you had \$22 trillion in residential housing. At the peak houses were worth that was a huge part of the American public's net worth. So we had a body blow and we are coming back from that. And we will see more things to do.

Charlie Rose: So you are saying you think and you are supporting the President and you had a fund-raising event here in New York because you believe he and his administration have made the right decisions for the economic growth of the country.

Warren Buffett: In general.

Charlie Rose: You see no specific example that was so egregious that you could not the support the President.

Warren Buffett: That's correct. And I will tell you, Charlie, we're making rail cars, this is not BNSF. This is a company called Marman. We make tank cars. We lease them frequently. We're down in Alexandria, Louisiana. I think we've increased production three or four times in the last 12 months. I mean we're employing a lot more people in Alexandria, Louisiana building tank cars then we were a year ago. And it's been step- by-step, it's increasing. We're seeing utilization of cranes in terms of oil fields. But we see it all over --

Charlie Rose: But what makes you different. Because the conventional wisdom is that most of Wall Street that supported the President last time is not supporting the President this time; Jamie Dimon included.

Warren Buffett: Yes, well --

Charlie Rose: These are people who look at the economy, the same economy.

Warren Buffett: Jamie, I don't think Jamie would tell you the economy is not getting better. In fact I think I've seen something where he specifically said --

Charlie Rose: No he has said -- and the bank is getting better and he's happy with the bank.

Warren Buffett: Yes. Right. But he is --

Charlie Rose: But he's not supporting the President as far as we know.

Warren Buffett: We don't know.

Charlie Rose: But a lot of Wall Street, at least you will accept the idea that a lot of people look at the same evidence and say we don't think the stewardship has been so good and we don't believe that the economy is as good as you do. And they think regulation and everything else is part of the mix.

Warren Buffett: Yes, I would say this. Most of them are in businesses that are doing pretty well. They may not be doing as well as in the binge. I mean Wall Street had been doing as well, but you take the number of people making a million dollars or over on Wall Street and you can fill a very large auditorium.

Charlie Rose: Yes. So they're doing well.

Warren Buffett: There are a lot of --

Charlie Rose: But they're not supporting the President, are they.

Warren Buffett: No, they aren't -- I would say -- that's my impression.

Charlie Rose: So what happened? Why have they deserted the President?

Warren Buffett: I think some, there was some rhetoric that contributed to that.

Charlie Rose: Demonizing of business.

Warren Buffett: They felt that. And I think the President felt I got to look at all the things we did for business and they're unappreciative. I'm all that stands between them and the pitchforks.

Charlie Rose: He said that at one meeting.

Warren Buffett: Yes. And so Wall Street certainly doesn't feel loved. And they might like to feel loved.

Charlie Rose: But you don't find that in mainstream America. You don't find that in Omaha. Or you don't find that in --

Warren Buffett: Well, there are people -- there's no question, you know, it was Mayor Cuomo (ph) that said you campaign in poetry and you govern in prose. And if you think about it the whole act of campaigning is raising people's expectations and once you get there you have to bring them down.

Charlie Rose: You essentially are saying that -- you're not disappointed by this President for the most part.

Warren Buffett: No. I agree with that statement. I'm not disappointed, no.

Charlie Rose: Like some --

Warren Buffett: Everybody has --

Charlie Rose: You're like the ones who supported him more loudly, Bowles- Simpson, that kind of thing.

Warren Buffett: Yes. Definitely. And listen, any time you like a president are you not going to feel 100 percent about every single thing they do. I'm sure the shareholders of Berkshire Hathaway don't feel 100 percent about everything I do. It just doesn't work that way in a country with 300 million people. And strong feelings about this issue and that issue --

Charlie Rose: I mean what about this idea that somehow if we had someone who understood business, who had managerial experience in business or managerial experience at all, we would have been in a better place. The decisions would have been different.

Warren Buffett: You know, I don't think-- I think if you take the overall group of decisions, I don't agree with that. I think that sure, a given decision might be better here or there. I mean the decision to make Tim Geithner Secretary of Treasury was a terrific decision. I mean that is -- that's --

Charlie Rose: And to talk him into staying.

Warren Buffett: Yes, well, yes. But when I pick a good CEO, that's a terrific decision; and then I don't have to think about that.

Charlie Rose: Is it possible that you are just different? That somehow, somehow because of your mother, because of your wife, influences on you have made you different, your own native intelligence, whatever it is.

Warren Buffett: Well, everybody is influenced by what's around

Charlie Rose: Ben Graham (ph) -- whatever it is that you, Warren Buffett, look at the world differently than most of the prominent businessmen in America.

Warren Buffett: Well, it may be true I think differently than a very good number of them. But I have lot of them that agree with me, one way or another -- they don't agree 100 percent with me.

Charlie Rose: Is it they -- yes, go ahead.

Warren Buffett: Yes, but nobody is in total sync with anybody else even if they're twins, probably. But there are -- I've heard from plenty of people who are very, very wealthy and I've heard from others who are business people who are not that wealthy. But that -- that in general agreeing with what I thought -- they've got -- they've got a similar hope for America. And there's plenty that disagree.

Charlie Rose: Two things that are on the horizon. Number one is Europe.

Warren Buffett: Yes.

Charlie Rose: You have I think said you're not going to be rescuing any banks over there, with any kind of significant investment. You've also said if this thing goes bad, you're in great fear of what the consequences are. What did you mean?

Warren Buffett: Well, it's big. And -- and you know, they have tried an experiment which -- where the imperfections in it are becoming manifest. And -- and the numbers are big. The banks are -- the solvency of the banks --

Charlie Rose: Right, right.

Warren Buffett: -- the banks are intertwined with the -- with the solvency of sovereigns and vice versa. And they have found that, well, they melded into a single currency for 17 countries, they didn't -- they didn't meld the culture. They didn't meld fiscal policies --

Charlie Rose: The politics, the politics.

Warren Buffett: -- all kinds of things.

Charlie Rose: Yes.

Warren Buffett: So they either have to come closer together in a major way or they have to separate. And -- and --

Charlie Rose: Yes and give up on the Euro and give up on the Euro Zone.

Warren Buffett: Yes and they don't want to do that and that's understandable. And there's all kinds of --

Charlie Rose: But there is also this argument: all they are doing is kicking the can down the road.

Warren Buffett: Well, they got to --

Charlie Rose: They really need a lot more on -- on the line and they really need to sort of do more at one time to make sure that they have stopped --

Warren Buffett: It's a short road, Charlie. You can see the end of that road. They better not give it a good kick or it won't be on the road any more.

Charlie Rose: If they thought it was a cliff --

Warren Buffett: Yes. No --

Charlie Rose: So what happens to us if it happens? If the worst happens what happens to the United States? What happens to the global economy?

Warren Buffett: I don't think -- I think-- I don't know what they are going to do. I mean when you get 17 of them, nobody knows what they are going to do. And politics et cetera, all kinds of things. But if you ask me the most likely thing that in the end they will -- they will decide to print money, which they've got a lot of problems doing because they do have this common currency. But when politicians face almost insufferable problems and it looks like they can solve it by printing money, I think they will do it. I think they will, they will -- to the extent they need to, they will -- they will help the banks but I don't know what -- I don't want to -- that's not a prediction. That's my best guess.

Charlie Rose: Yes but -- but the hour's late.

Warren Buffett: It's late. It's very late. And it's -- it's very late. They -- their banks were encouraged to load up with sovereign debt because there were no capital requirements against them. And it gave them the chance to leverage further and increase the earnings per share a little bit so they can load it up with them. And they thought that they were all good credits because they all belong to this union. And they're finding out that isn't true.

Charlie Rose: What did you see a year or so ago when you got out of European sovereign debt.

Warren Buffett: I saw where the can was going.

Charlie Rose: No but I mean, did you see it, and other people didn't see it?

Warren Buffett: Well, no, I think people --

Charlie Rose: Saw it but didn't --

Warren Buffett: It -- it was-- it's a little like our own situation back in 2006 and 2007. Everybody sort of saw it but you kind of thought well --

Charlie Rose: Well, I don't know that they all saw it but I don't think they understood it. I mean part of the problem was that the people didn't understand it. I mean the subprime crisis -- or you think I'm wrong about that. They saw it?

Warren Buffett: Well, I think people had kind of an uneasy feeling, a lot of people. But they thought, they were like Cinderella at the ball.

Charlie Rose: Right exactly that was the analogy they used, you remember? (INAUDIBLE) the executive says, you know, as long as the music is playing you have to keep dancing.

Warren Buffett: Right.

Charlie Rose: That was a classic --

Warren Buffett: That's right. And -- and he -- you know, he's probably going to (INAUDIBLE) mice at midnight but they didn't think it was midnight. And he thought he would get out ahead of time, it is -- that's - - he's not the only one.

Charlie Rose: There was a lot of that and in fact --

Warren Buffett: I made a lot of mistakes in that respect. I mean -- and I saw certain things taking place. But I didn't take strong enough action in many cases. I am as guilty as anybody. But in terms -- in terms of Europe, I think it was -- I think it was clear, well over a year ago that we were heading for a cliff. I mean they -- you just can't have people tied to a given currency who have lost the ability to print money behaving recklessly. And so it's going to -- it's going to come home to roost very quickly. And when those bond -- when bonds of those countries are -- are held in huge extent.

Charlie Rose: Yes.

Warren Buffett: And it's -- it's a bad situation. And it won't end the world, Charlie. Europe isn't going to go away. Europe will be stronger ten years from now for sure than it is now. I don't know how much agony it's going to go through in between. There will be a great market for goods, there will be great --

Charlie Rose: But is the answer austerity?

Warren Buffett: I don't know.

Charlie Rose: That's the question.

Warren Buffett: I mean it -- it's always great to say the other guys should get austerity. I mean that's the problem they have. It isn't a common austerity. It -- it's your austerity will take care of my bonds.

Charlie Rose: The Germans have a point, don't they?

Warren Buffett: Yes, sure they have a point, sure they have a point. Sure they have a point.

Charlie Rose: People are beginning to say maybe a flat tax is not such a bad idea.

Warren Buffett: A flat tax is, that is not progressive.

Charlie Rose: No.

Warren Buffett: No, no I mean -- you're going to have to raise some more revenue than we're raising now. I mean, we're going to have to bring it up to 18 percent of GDP or 15.5 percent.

Charlie Rose: Right, right.

Warren Buffett: And we're going to have to bring spending down.

Charlie Rose: Why don't you convince the President to lay out what he would do in terms of entitlements?

Warren Buffett: I -- Charlie, I have never called a president in my life.

Charlie Rose: You've never called him though.

Warren Buffett: No.

Charlie Rose: But he calls you and ask you to come and speak; he solicits your advice. And you come to that White House because he wants to hear what you have to say, I assume. He doesn't -- he doesn't bring you there to tell you what he thinks. He wants to know what you think.

Warren Buffett: He wants to give me a new tie, actually.

Charlie Rose: That is true.

Warren Buffett: He but it --

Charlie Rose: And it wouldn't have been better if he'd laid out for the -- for the political discourse in Washington, if he had laid out where he thoughts cuts would be appropriate.

Warren Buffett: Well, looking back, but this is easy to do. You do it in the stock market all the time.

Charlie Rose: Right.

Warren Buffett: But looking back, he probably should have prepared the American public somewhat better for what lay ahead. I mean we were not going to -- there was not going to some magic wand when he came in, in 2009. And he -- he did a lot of very correct things. I mean I -- I admire him enormously and the actions taken. But to the extent the people thought that was going to cure everything in six months or eight months or ten months, I mean that was -- that was a mistake.

Charlie Rose: As you know Standard & Poor's downgraded their evaluation of America mainly because of political dysfunction.

Warren Buffett: Right.

Charlie Rose: That at least is what they say. Do you know how we stop this political dysfunction?

Warren Buffett: That's the \$64 question. I mean we've got people -- we've got too many people in Washington and -- and the American public understands this who are thinking primarily about, you know, how do we block the other guy from looking good. And -- and I want them both to look good. I want a government that looks good. And it's a -- it's always, there's always been a lot of that. But -- but I think it's -- it's just extraordinary. And -- and the -- and the -- the debt ceiling situation you know, just played it out in Technicolor and stereophonic sound for the American public. And the American public feels that -- that Washington just is -- in some ways dysfunctional because they want it to be dysfunctional. And that's -- that's --

Charlie Rose: Will they think they win by dysfunctionality?

Warren Buffett: Well, if -- if -- if you can be in either party and convince the American public who are not feeling good about how their country is going, if you can convince them it's the other guy's fault, I mean, that's -- that's the way to win.

Charlie Rose: Yes. Did you would think the American public would rebel against that if they could find out who they thought shows the least regard for their own sense of well-being?

Warren Buffett: I would really hope so and I think there's a possibility of that. But how this all plays out, I mean, I think that there's -- I think there are plenty of people in both parties, this is not limited to one party, who -- who are thinking that things are going to look bad over the next 12 months, at least be perceived as bad and the unemployment rate won't fall that much and so on. And I think they think how do we lay this on the other guy's doorstep. And that's --

Charlie Rose: And so therefore I will not vote for something that might improve the economy of the country because I don't want to see the other guy do well.

Warren Buffett: Well, I -- it may not be quite that dramatic but it's -- it's -- it's that impression. And -- and I think that's why people have the feeling about Washington that they do.

Charlie Rose: But the problem is that they may very well be saying a plague on both your houses. They're certainly saying that about Congress.

Warren Buffett: Yes, I think they feel that way about Congress.

Charlie Rose: Yes.

Warren Buffett: And I think they probably got a pretty good reason to feel that way about Congress.

Charlie Rose: Do you think we need a third party?

Warren Buffett: Oh I just don't know how that works, you know.

Charlie Rose: It's great to see you.

Warren Buffett: It's great to be here.

Charlie Rose: A pleasure to have you here.

Warren Buffett: Thanks Charlie and another 20 years to you.

“Tap Dancing to Work” (2012)

11/26/2012

Charlie Rose: Warren Buffett and Carol Loomis are here. He's one of the world's most successful investors and a long time friend of this program. She is the legendary "Fortune" magazine writer who has followed his career since he was a 35-year-old hedge fund manager from Omaha. Back in 1966 she couldn't even get his name right. When Carol Loomis made the first mention of Warren Buffett in "Fortune" she spelled his name with only one "t". It was an unlikely start to a beautiful friendship and to "Fortune's" coverage of the man who we've come to know as the chairman of Berkshire Hathaway. "Tap Dancing to Work" is Carol Loomis' new book; it is a collection of articles telling the remarkable story of Warren Buffett. It's also a story about friendship. I am pleased to have them together at this table. Welcome.

Warren Buffett: Thank you.

Charlie Rose: It's so good to have you; you both have been here separately --

Carol J. Loomis: It's good to be here.

Charlie Rose: -- but to have you together.

Carol J. Loomis: It's terrific.

Charlie Rose: And so I want to talk about the book and about the career and about "Fortune" magazine and the relationship, but first this morning we all got up to read an op-ed by you called "A minimum tax for the wealthy". And you start off by saying that most investors you know, if it's a good deal they're not going to be upset about the fact that they're going to have to pay some tax.

Warren Buffett: Every investor I know. I've never -- I'm 82 years old and I'm looking like Diogenes; I'm out there looking at that investor who says "I think I'll pass on this chance to make a lot of money."

Charlie Rose: Even if it's a certain deal I'm going to pass --

Warren Buffett: Charlie I'm going to call you tonight at midnight and I'm going to not be panning and I'm going to say "This is the best idea I've ever had." And you're going to say "How much will the tax I have to pay?"

Charlie Rose: I don't think so. Here is how you in the article you say "In the meantime maybe we'll run into someone with a terrific investment idea who won't go forward with it because of the tax he would owe when he succeeds. Send it my way. Let me unburden him."

Warren Buffett: That offer goes to all viewers.

Charlie Rose: You started with that but you have a serious purpose here.

Warren Buffett: Sure.

Charlie Rose: What is the minimum tax that you think ought to be done today by Congress and not wait for all the time it might take and all the deals it might take to reform the tax code?

Warren Buffett: I think on incomes of over \$1 million that the excess over \$1 million should be -- have a minimum tax of 30 percent. As you know, they're talking about bringing the top tax rate up to 39.6 percent.

Charlie Rose: Right, right.

Warren Buffett: And right now the tax rate is 36 percent.

Charlie Rose: So if you make from \$1 million to \$10 million a minimum tax of 30 percent.

Warren Buffett: On the \$1 million to \$10 million.

Charlie Rose: Right.

Warren Buffett: And then over \$10 million 35 percent.

Charlie Rose: Yes.

Warren Buffett: And the reason I'm suggesting that is because the 400 highest taxpayers in the most recent year we have figures for, 2009, who had average incomes of \$202 million, half of those people paid at a rate below 20 percent. A quarter paid at a rate below 15 percent. And believe it or not, six, average income of \$202 million paid nothing. I mean they were members of Romney's 47 percent. I mean -- and I suspect he got their vote -- but they're just a bunch of moochers, just a bunch of moochers.

Charlie Rose: You think that they voted for him, did they?

Warren Buffett: Yes. You know, but they're -- well, we've conducted a survey three times in my office in three different years and the office has between 16 and probably 21 employees during that period and each time my tax rate was considerably lower -- I'm talking about payroll taxes plus income taxes -- considerably lower than anybody else in the office. And these -- these people made various incomes. And -- and the tax law in many cases is not progressive. I think the tax law should be progressive. I think that when people make \$15 or \$20 million or \$200 million and pay a 10 percent rate I think -- I think something should be done about that.

Charlie Rose: But people say that -- people step forward and say well, that's because most of the income comes from dividends which is taxed at a lower rate.

Warren Buffett: Well most -- they would probably say most of it comes from capital gains.

Charlie Rose: Right.

Warren Buffett: And that's taxed at a lower rate.

Charlie Rose: I mean capital gains.

Warren Buffett: This -- yes this just -- this just makes sure that people that have really high incomes pay at a rate the sort of like the people next door to them are you know who are making \$100,000 a year or something of the sort.

Charlie Rose: If you had automatic powers to establish what the tax rate should be both for -- for capital gains and for ordinary income, what would you set it at? Well, I would -- I would probably have -- I would probably feel that capital gains should be at least at the 25 percent level and I would -- and -- and dividends should be as ordinary income and I would have a more progressive tax system than we have. But since -- since the lobbyists and the lawyers for the rich are so good at getting around these things I would have a minimum tax so no matter who your lobbyist or lawyer was, if you -- if you had \$10 million or \$20 million of income you paid at a rate comparable to what most of the people who are watching this program pay. You write about and you know enormously successful businessmen and women. Do you

think that if you sat down on a one-on-one conversation, they would agree with him or not? Which are they?

Carol J. Loomis: Well, I don't think -- I don't think it would be unanimous by any means.

Charlie Rose: Yes.

Carol J. Loomis: Well, the majority --

Charlie Rose: Does he represent a voice in the wilderness for very wealthy people in the ideas he has about what's necessary and fair to do?

Carol J. Loomis: I think there are a lot of people who agree with him. But I'm not sure that it would be over 50 percent by any means.

Charlie Rose: So you think he's right?

Carol J. Loomis: I do think he's right. And I must say, my husband worked on Wall Street during a time when there was a lot of income associated with working on Wall Street and so I'm not talking as someone who wouldn't be subject to quite a lot of tax. And I think the problem is no one's ever talking about the payroll tax. That just doesn't ever come into the discussion. But when you add it in as Warren has pointed out that you should do, it makes a huge difference and so I do think he's right.

Charlie Rose: You hope that the President will be responsive to this. You think it's what ought to happen today.

Warren Buffett: I think -- I hope the President and the Congress is responsive to it.

Charlie Rose: Yes.

Warren Buffett: I think that -- I don't think we should wait around to have a -- there are all kinds of things wrong with the tax code. Reform is called for. Expenditure cuts are called for. But I don't want to wait around until all of that stuff is done to do some things that are obvious now. So the people who talk reform, some of them -- many of them really are seeking reform. But some of them are saying "reform" because it just means pushing things down the road another year or two. And I -- I do not want to have something that obviously should be done be held hostage to getting everything done.

Charlie Rose: So therefore do the minimum tax now?

Warren Buffett: I'd like to say starting January 1st.

Charlie Rose: What happens if the fiscal cliff comes and happens? What will it do to our economy?

Warren Buffett: I -- I don't think it will do that much because I think people will assume that a solution will be found quite promptly. It's a little like the debt ceiling question. I mean people know -- the rest of the world may think that we're idiotic at times but they don't think we're going to commit suicide. And -- and so I think if -- I hope something gets worked out before January 1st, but if it -- if it goes a little bit beyond that I do not think --

Charlie Rose: So January 10th or January 2nd --

Warren Buffett: I will not -- if you guaranteed me that the fiscal cliff we would go past that, I wouldn't sell a share of stock today.

Charlie Rose: That -- you have that confidence that in the end they will fix it?

Warren Buffett: Yes, and that this economy works.

Charlie Rose: Is it getting better?

Warren Buffett: It's getting better. It's been getting better since really the summer of 2009. And you know we've got four years straight now where the stock market's given a positive return. I mean the economy is getting better. We had a tremendous bubble and when it burst it was -- it had ramifications for all aspects of society and it was magnified by the abuses that had taken place in -- in -- in Wall Street and all kinds of places. So the dominos were lined up. We had plenty of problems. But we have been on -- we've been the mend now for -- for three years and it's taken a long time because it was a big problem but we are getting better all the time.

Charlie Rose: This book is about "Tap Dancing to Work. Why did you choose that title?

Carol J. Loomis: Let me tell you I've learned a lot about the publishing world in the last few months and I've learned that the title is a process of negotiation between the publisher and you. And I came up with this after we'd considered two or three others and the publisher just displayed great judgment. Said "I think it's a wonderful title, let's go with it." And that's what's apt because he is a man, who tap dances to work; he has forever.

Charlie Rose: This -- and has talked about it. I mean in the interviews yo have talked about tap dancing. It is someone -- you explain to me tap dancing was?

Warren Buffett: Well it just means that I can hardly wait to get to work in the morning. And -- and -- and I mean it's the most exciting part of the day is getting there. And I -- there's never been a day I haven't looked forward to it.

Charlie Rose: Do you like Monday through Friday better than Saturday and Sunday?

Warren Buffett: It depends whether Nebraska is playing football.

Charlie Rose: Or if they're playing Notre Dame.

Warren Buffett: Yes, well, yes I don't want us to play Notre Dame this year.

Carol J. Loomis: What makes you think he doesn't go to the office on Saturday and Sunday?

Warren Buffett: I go to the office on Saturday.

Charlie Rose: But -- but what you do at the office and what you do at home is the same thing. You're reading and on the phone.

Warren Buffett: I'm reading and -- I'm reading and thinking and on the phone and talking to friends. And - - you know, there's very little difference in my -- in Saturday and Sunday from the weekdays. A little more action during the week, though.

Charlie Rose: This reminds me of what surprised you most about in terms of advice. You asked him what was the worst advice?

Carol J. Loomis: I ask him what --

Charlie Rose: Or some of the best advice.

Carol J. Loomis: Well, we were -- we were doing a big action (ph).

Warren Buffett: Right. He was going to be on the cover and so I -- without truly knowing the answer to the question I said all right, now, tell me what is the best advice you've ever gotten in your life from anyone? And he proceeded to talk for a long time about the worst advice that he had ever gotten. And so I went back and told my managing editor this, which probably kind of -- with my head down in -- in thinking well I hadn't come back with quite the right thing and we put him on the cover anyway. So --

Charlie Rose: But what's interesting is what you -- the way you answered the question which is smart people told you don't go into the securities business.

Carol J. Loomis: Right.

Charlie Rose: And what did you read from that? Because you went into the securities business.

Warren Buffett: Yes not only smart people, but people that love me and that I love them. So I mean they were giving me their best advice.

Charlie Rose: Because they thought you weren't ready for it or the security business was a bad business at that time.

Warren Buffett: They thought stocks were selling too high because the Dow Jones was above 200 and I always feel on almost anything that if you're going to do it, get started. And I mean the idea of sitting around and waiting for a different time did not -- did not register with me. Now, it's also possible that I was 20 years old then and that I was behaving like I was about 14 and looked like I was about 16 or something.

Charlie Rose: Yes.

Warren Buffett: So they -- that may have been their nice way of telling me "Grow up a little bit before you do it." But beyond that, though, they really did feel -- here are the two guys I admired the most in the world and they told me they thought the stock market was too high.

Charlie Rose: This is your father and Ben Graham.

Warren Buffett: My father and Ben Graham and I just said "Listen, I want to get going." You know I -- I didn't want to go to college.

Charlie Rose: Yes but you'd already been going because you already had been investing since you were 11 years old.

Warren Buffett: That's true but now I could do it full time.

Charlie Rose: So the first time you met this guy.

Carol J. Loomis: Right.

Charlie Rose: You were actually doing a piece. Before you met him you were doing a piece on a hedge fund guy -- what's his name?

Carol J. Loomis: Alfred Winslow Jones.

Charlie Rose: Alfred Winslow Jones.

Carol J. Loomis: Right.

Charlie Rose: One of the --

Carol J. Loomis: He's very famous.

Charlie Rose: A very famous guy and the name Buffett came up.

Carol J. Loomis: Buffett came up and Sam Stamen, a bridge player, was an investor in this strange thing called Buffett Partnership Limited.

Charlie Rose: Yes?

Carol J. Loomis: And I just blithely went ahead and spelled it with only one "t". So I -- the first time that he was ever in "Fortune" we misspelled his name. And you know I say that's the editorial "we" because it was I who did it.

Warren Buffett: And since she's never been wrong I've been (INAUDIBLE) with one "t" ever since.

Charlie Rose: Your husband, John Loomis.

Carol J. Loomis: Yes.

Charlie Rose: Met him first.

Carol J. Loomis: Yes, he did.

Charlie Rose: And came back and said what?

Carol J. Loomis: He said "I think I've just met the smartest investor in the country." And of course I'm sure like wives do I rolled my eyes and thought, oh, yes, yes. Then I met him with his wife -- first wife Susie and I realized how terribly impressive he was and from that day forward I thought that, too.

Charlie Rose: And then he formed Berkshire Hathaway.

Carol J. Loomis: Well, he'd taken over Berkshire Hathaway but it was -- nobody even knew the name. It was totally insignificant. And so then we worked up from that one sentence with the word misspelled to two paragraphs in 1970. But by 1977 we had a 7,000-word piece by Warren himself. We recognized that he was a very good writer and we -- we went forward with that, too. And so there -- this book has a dozen pieces by him and that the one I just mentioned was only one.

Charlie Rose: What was that piece? The first piece?

Warren Buffett: Well, that was how inflation swindles the equity investor.

Charlie Rose: And people still talk about that piece.

Warren Buffett: I'm not sure what they say about it.

Charlie Rose: I read that. There are still people --

Carol J. Loomis: They write -- they write him about it. They write us about it. It's a -- it's a famous piece. It really is.

Charlie Rose: If you were writing today the same kind of piece-- and perhaps you are -- other than the letter to stockholders, what would you be saying about where we are?

Warren Buffett: I would say that -- I would do a lot of historical things and all of that but basically I would say that for most -- overwhelmingly for people that can invest over time that -- that equities are the best place to put their money.

Charlie Rose: I should also talk about the letter to the stockholders. You came in to do -- you knew her, you admired her, you thought she was the best business writer you'd ever met.

Warren Buffett: Absolutely.

Charlie Rose: And still do.

Warren Buffett: Yes.

Charlie Rose: Tell me about the letter to stockholders and what you want to do with that and who you're addressing in your own mind's eye?

Warren Buffett: I'm addressing partners, there are 600,000 of them. But in my mind I usually have my two sisters Bertie and Doris. And they're very bright. They don't work in the financial world. They've been gone for a year, metaphorically, and they've got a lot of their money in Berkshire and I want to tell them what I think is important to them. What I would want them to tell me if our positions were reversed. So I try to do that. And then I occasionally branch into an essay on something that I think may be important in the investment world generally.

Charlie Rose: Or even the country.

Warren Buffett: Yes.

Charlie Rose: And you got involved in the beginning --

Carol J. Loomis: Well, I got involved with the letter 1977 and --

Charlie Rose: Warren said take a look at this?

Carol J. Loomis: Warren sent it to me and said "I'm trying something new with the annual report, would you just look it over and tell me what you think?" And I was very timid in what I came back with. I said, I think I suggested changing a "the" to an "a".

Charlie Rose: Yes.

Carol J. Loomis: And then that seemed to work all right and so the next year he sent it again and then it became a routine where he would write it in long hand. His assistant would type it and it would come to me and then we would have drafts flying back and forth with suggestions from me.

Charlie Rose: Well, I think there's a story in here, too, that the first thing you wrote the editors wanted to change some things. Was it the first thing? And -- and basically they almost killed the article because you didn't want that much editing?

Warren Buffett: Well, and -- and I think that was the 1977 article.

Charlie Rose: Yes right, exactly.

Warren Buffett: Yes Meg Greenfield, who was a famous writer for "Newsweek" and --

Charlie Rose: Right, yes.

Warren Buffett: I showed her the -- the article I'd written and Meg very gently said to me "Warren, you don't have to tell everything you know in one article." Although I go with the

Charlie Rose: Isn't there a story in there that one of the editors at "Fortune" went in to the big editor and said --

Carol J. Loomis: One of the editors went in -- the one who was assigned to the piece and went out to Omaha to get him to change certain things called up and said "I'm not having too much luck getting him to change anything. Maybe we should think about not running this." And the managing editor said "No I think it's worthwhile."

Charlie Rose: Yes.

Carol J. Loomis: And so we did. 7,000 words without many pictures -- really not about, not any pictures.

Charlie Rose: And so what does she do now? Just dotting "I's" and crossing --

Warren Buffett: No, for one thing I -- I -- I rewrite it about ten times before I send it to her. And then -- and then I send it to her and -- and she never tries to change the content or anything like that but -- but she points out when the flow is wrong, where there's lots of grammatical errors, all kinds of things and -- and sometimes she'll write "This is my least favorite part of the report," which is -- and usually it is, too.

Charlie Rose: So how many years has it been this friendship?

Carol J. Loomis: Well, what is that? 35? 35 years. Oh, the friendship has been longer than that.

Warren Buffett: Yes, yes.

Carol J. Loomis: The friendship goes back to 1967.

Warren Buffett: Yes. She has a charm bracelet -- four charm bracelets, a replica of every -- a copy of every report.

Carol J. Loomis: Right.

Charlie Rose: So what's the secret to the friendship?

Warren Buffett: Well, I -- certainly on my part all kinds of things. I mean she's a wonderful friend but she's -- she's also one of the smartest people I've ever seen and she's objective and -- and in a very, very nice way she tells me when I'm full of baloney and a few things.

Charlie Rose: Is that how you see it Carol?

Carol J. Loomis: Well, I do think I'm one of the few people who argue with him.

Charlie Rose: Yes.

Carol J. Loomis: I do think that. And I do sometimes about --

Charlie Rose: You don't have people argue with you?

Warren Buffett: Charlie -- my partner Charlie Munger -- we've never had an argument, we had a lot of disagreements and wherever we have a disagreement his clincher always is "Warren, when we get through talking about this you'll agree with me because you're smart and I'm right."

Carol J. Loomis: And I will include Charlie in the few people who argue with him. I just -- I do think it's only a handful.

Charlie Rose: That will argue with him. Here is what interests me. Why is he -- does he the record he does? And you have said in a conversation with me he understands how to look at accounting statements and find the telling point. And it may be in a footnote.

Carol J. Loomis: That's true.

Charlie Rose: So that he'll see opportunity and see the future.

Carol J. Loomis: He will. He has a -- an ability to do that that I think is matched by very few other investors. And he has this broad, extensive knowledge of business and I think maybe I said this to you. So when something new comes up, he has a frame of reference in which to place it. And then he adds this rationality that I really think just a handful --

Charlie Rose: What do you mean by rationality?

Carol J. Loomis: Well, he doesn't let emotion take over when he's considering whether to buy. He goes at the decision in a very rational way and then the price goes down and he buys more whereas most people panic and sell when the price goes down. And he just is -- he's extremely disciplined in the way he thinks about investments.

Charlie Rose: This will take a long time to explain, but -- but how is it that you know value so well? So that if it goes down you know the value hasn't changed so you buy more. And so that you know the value -- so you're not going to pay a nickel more than the value you see.

Warren Buffett: I only get into the situations where I do know the value. There's -- there's thousands of companies whose value I don't know.

Charlie Rose: Yes.

Warren Buffett: But I know -- I know the ones that I know and -- and -- and incidentally, it is -- you don't pinpoint things. I mean, if somebody walks in this door now and they weigh between 300 and 350 pounds, I don't need to say they weigh 327 to say that they're fat.

Charlie Rose: Right.

Warren Buffett: So if -- if they're in that zone I'm fine with it. And -- but I also know that there are all kinds of companies that I can't figure out. So I don't -- so I do know -- I usually know when I'm dealing with companies that I understand and then I do -- accounting is a language, and it's a language that I like.

Charlie Rose: A language you not only understand but like.

Warren Buffett: I like it, yes.

Charlie Rose: Because it speaks to you.

Warren Buffett: It really speaks to me and -- and -- and when it speaks in a false voice I can detect that sometimes, too. So you know I mean it's -- you know -- it -- it is almost like playing music, you know, when you look at an accounting statement. And that's not true of all companies. It's not true of all companies at all. But you don't have to be right about -- I don't have to be right about the ones I ignore.

Charlie Rose: When you see a footnote that says something to you, you just feel of kind of emotional --

Warren Buffett: It's -- it's in the footnotes. Yes you're right. I mean the footnotes -- the footnotes are --

Charlie Rose: Good or bad, there's a story.

Warren Buffett: There's a tipoff there. Yes and Carol is very, very good at this, incidentally, herself.

Charlie Rose: Yes.

Carol J. Loomis: Well, so far down the ladder on this compared to where he is.

Charlie Rose: Let's look at the investments that Berkshire and some of this -- you still have a lot of Coca-Cola?

Warren Buffett: A lot. Yes.

Charlie Rose: You saw the value of that early on.

Warren Buffett: Well, not early enough. I mean, I probably had my first soft drink in 1935 and I didn't buy the stock until 1988. So I would -- I would put me in the slow category on that one.

Charlie Rose: You still have a lot of Wells Fargo and buying more.

Warren Buffett: Yes a lot of Wells Fargo.

Charlie Rose: Yes value there you saw.

Warren Buffett: Yes. And the qualities you look for -- management is one. Sure, some kind of an enduring competitive advantage.

Charlie Rose: Yes.

Warren Buffett: Enduring being the emphasis. I mean hula hoops were great for a while or bedrocks and all that sort of thing.

Charlie Rose: Yes.

Warren Buffett: But -- but I like -- I like something where I think I can look out five or ten years and still see the same sort of advantage that -- maintaining.

Charlie Rose: So you just invested in John Deere.

Warren Buffett: That wasn't me. No. We have two other --

Charlie Rose: OK. OK.

Warren Buffett: Yes.

Charlie Rose: But you know what they're doing, do you not?

Warren Buffett: No. I don't want to know what they're doing. I don't want to know what they're doing.

Charlie Rose: Why is that? (INAUDIBLE) you hired to be sort of --

Warren Buffett: Well because I guess -- they manage -- they managing something around \$4 billion or something like that.

Charlie Rose: You don't want to know what they're doing?

Warren Buffett: No. I don't -- I -- they have -- they have the responsibility for managing that money. They've got to have full authority. They can't look at me and see whether I'm smiling or frowning over and they get paid based on how those securities do.

Charlie Rose: You have said you're hunting for a big elephant.

Warren Buffett: You bet, the bigger the better.

Charlie Rose: What qualifies as a big elephant?

Warren Buffett: Well, in terms of our present resources probably something from \$20 billion maybe up a little bit.

Charlie Rose: How high?

Warren Buffett: Well, it would depend on how -- how attractive that elephant was. So I mean -- not all elephants look alike.

Charlie Rose: Coming to you, Carol, in just a moment. So you're looking around. How will you go about this process of looking for a big elephant? Because you've said that the trigger is -- you've got your hand on the trigger.

Warren Buffett: Absolutely.

Charlie Rose: You're ready to fire.

Warren Buffett: You bet.

Charlie Rose: You've got the money. You've got \$45 billion or whatever it is.

Warren Buffett: Enough.

Charlie Rose: Enough. You've got it sitting right there.

Warren Buffett: Yes.

Charlie Rose: You're prepared to do it. How are you going to find the candidate?

Warren Buffett: Well if you're talking about buying an entire business, which we're talking about in this case.

Charlie Rose: Right, right.

Warren Buffett: I'm familiar with all the companies when you get to that size. I mean I've seen all the elephants. I've seen them all. And so -- so it's really a question of when they -- somebody at the company, the

Ceo: Yes.

Warren Buffett: -- is -- is actually thinking about doing something. And then I can -- I can tell very quickly --

Charlie Rose: Well you know whether they are open to --

Warren Buffett: Oh yes, whether -- the initiative really has to come from -- from them because, you know, Coca-Cola isn't for sale, Wells Fargo isn't for sale. And 99 percent of the companies are not --

Charlie Rose: IBM is not for sale.

Warren Buffett: Sure. And so and I know the universe of companies of this size we're talking about and if I pick up the phone one day and somebody says, you know, we've really been thinking about things and we feel that we'd do better as a part of Berkshire, I'm ready to --

Charlie Rose: This is what's amazing, don't you think Carol, is that a lot of the companies that come to Berkshire Hathaway, they wanted to be there.

Carol J. Loomis: That's right. That's absolutely right.

Charlie Rose: You know if they like the phone call, I'm thinking about the Israeli company.

Warren Buffett: Yes.

Charlie Rose: If somebody says Mr. Buffett, can I come to Omaha and talk to you.

Carol J. Loomis: Right.

Charlie Rose: And you're pretty quick on the draw to figure out whether you want to go forward.

Warren Buffett: Five or ten seconds, yes.

Charlie Rose: Talk about that.

Carol J. Loomis: Well he -- he --

Charlie Rose: Because mergers --

Carol J. Loomis: Mergers.

Charlie Rose: And acquisition.

Carol J. Loomis: You know he does make up his mind in literally minutes if not seconds as to whether this is something he wants to consider further. And he will, within that much time, say to the guy on the other end of the phone, "Well, I'm interested" or "Well, I don't think this is for us."

Charlie Rose: Yes.

Carol J. Loomis: And -- and he knows. He's seen this great universe of companies and this is what I was talking about. He brings this frame of reference to it and knows that this company has nothing of a kind of eternal nature to offer. Like Coca-Cola has something eternal to offer.

Charlie Rose: Yes. You also get in this book about biggest mistakes, right?

Carol J. Loomis: I do.

Charlie Rose: What's the biggest mistake this guy has made?

Carol J. Loomis: Well, Warren himself would say that there -- that there are acts of omission where he has known that he should buy a stock and hasn't bought it. One of that he cited there is Fannie Mae. This is before Fannie Mae got into trouble. That's right but he would have gotten out, I think. But he did get out of Freddie Mac, which was a case where he bought a lot and did get out at the right time. And so the biggest mistakes, well, a couple of times he's been hurt by people who erred in the way that they acted. There's no question about that. Well they were -- but this is the person that I'm thinking about had done a remarkable amount -- David Sokol-- had done a remarkable amount for Berkshire Hathaway and so I

don't think it was something that Warren could have known that presented with a certain set of facts that David Sokol acted in a way that didn't work.

Charlie Rose: I bet you asked yourself that question, didn't you?

Warren Buffett: Yes.

Charlie Rose: How could I have not seen --

Warren Buffett: I don't know the answer.

Charlie Rose: You don't, could never. Did you review in your mind --

Warren Buffett: And he did a lot of good things for Berkshire.

Charlie Rose: Yes of course.

Warren Buffett: Yes.

Charlie Rose: But you've said the hardest thing to do -- and it doesn't happen that often is to fire somebody.

Warren Buffett: Yes. It's -- it's absolutely miserable. But -- and you know, I don't have to do it very often. But I'd pay a lot of money to have a designated firer. But the trouble is -- the trouble is I can't do it because these are people who are friends of mine.

Charlie Rose: You -- one of these cover stories -- and you have to remind me which one it was -- signal, I think it was the one you wrote, the big profile, of the transition from investor to CEO and manager.

Carol J. Loomis: Yes.

Charlie Rose: Showing that -- that Warren Buffett had those skills as well.

Carol J. Loomis: Right. Well, there are several articles in the book that really pertain to that. But I think the one that you have in mind is "The Inside Story of Warren Buffett."

Charlie Rose: That was the first big profile.

Carol J. Loomis: That's a big profile. And it was the first big article I ever wrote about Warren. I'd only written two paragraphs that kind of thing. And it was 1988 and he was making a transition then. At the time he had six companies that he called the sainted six -- six or seven?

Warren Buffett: I think it was seven.

Carol J. Loomis: Seven that's right, Sainted Seven. And names like Fetchheimer that you are --

Charlie Rose: Right, right.

Carol J. Loomis: -- that you know they don't ring wildly but even now.

Charlie Rose: Right.

Carol J. Loomis: And -- but he was clearly headed in that direction and Charlie was helping him because Charlie was pointing out to him the virtues of things like C's Candy. And they were really at that moment transitioning to a company that had been distinguished by its investments to a company distinguished by the companies that it owned entirely. And even today I think that Berkshire Hathaway is underestimated.

Warren is not underestimated. But Berkshire Hathaway and its power and might I do think is a little bit underestimated.

Charlie Rose: But you have a reputation for delegation.

Warren Buffett: Yes. Abdication, actually, is what you call it. I like other people to do the work, Charlie.

Charlie Rose: But you're not out on a boat somewhere. You're not out --

Warren Buffett: No.

Charlie Rose: -- you know, you don't delegate because you want to go do something else. What you want to do is the same thing you've been doing everyday for a long time.

Warren Buffett: You bet, yes. I like knowing what's going on but I don't want to direct the orchestra, I want to listen to it.

Charlie Rose: I once asked what was the allocation of capital -- how would he define -- he said "Well, they send the money to Omaha." That's what allocation of capital is.

Warren Buffett: I got wise. I do that.

Carol J. Loomis: And the CEOs of the subsidiary say they don't even have to worry about it. They just ship it off to Omaha and that's it.

Charlie Rose: We'll make it, you spend it. Is that your idea of what makes Berkshire Hathaway great?

Warren Buffett: Well, we've got this \$12 billion or \$13 billion a year to work with.

Charlie Rose: All right, these are some pearls of wisdom. Rules of investment: Rule number one: never lose money. Rule Number two: never forget rule number one. And on a career advice I think this is very important. I always tell college students to take the job that you would take if you were independently wealthy. You're going to do well at it. You and I, true.

Carol J. Loomis: That's absolutely true. You know that in most companies merit is recognized. And so what you need to do is to get into a company and show how good you are and you will get pushed up.

Charlie Rose: That's exactly what I say.

Warren Buffett: I moved to New York when I was 23. We had a child, we another one on the way and I took a job with Ben Graham, who was my hero. And I did not know my paycheck until I got -- my pay until I got my first paycheck. I never asked what the salary was. I just knew I would love the job.

Charlie Rose: He and your dad still remain the people that had the most influence on you in terms of --

Warren Buffett: Well, they were huge but I've had others, too. I mean, yes, Joe Rosenfield, Tom Murphy. Certainly my wives. Carol's had a lot of influence on me.

Charlie Rose: She played bridge with you.

Warren Buffett: She's just had a lot of influence.

Charlie Rose: What would you -- you call her up every day.

Warren Buffett: Just about every day.

Charlie Rose: Or she calls you every day?

Warren Buffett: No I call her.

Charlie Rose: You call her.

Warren Buffett: Just about every day.

Charlie Rose: So what's the conversation about? Did you see this? It's the kind of thing that --

Warren Buffett: Just depends what's going on.

Charlie Rose: Did you read this story? That kind of thing?

Warren Buffett: There's plenty to talk about.

Carol J. Loomis: Right. Big business events, you know. We haven't been so busy with our --

Warren Buffett: Your show last night.

Charlie Rose: Which you see the next morning while you're working out. This is another thing. "The Internet won't change chewing gum. When I look at the Internet, I try to figure out how an industry or company can be hurt or changed by it and then I avoid it.

Carol J. Loomis: Right.

Charlie Rose: Take Wrigley's, I don't think the Internet is going to change the way people chew gum.

Carol J. Loomis: Right.

Warren Buffett: Well, you know, the innovations are enormously important for society. But they disrupt a lot of things and, you know, I used in one of the articles in the book the auto industry. There's a couple thousand auto companies and a few succeeded-- barely. So auto was enormously important. I love the fact that it was invented. The airplane was enormously important. But if you take all of what's happened in the airline industry since Orville was down there in it Kitty Hawk, some capitalist should have shot him down because he's cost us money.

Charlie Rose: What's wrong with the airline industry?

Warren Buffett: Well, it happens to be selling something that's regarded as very much a commodity product. The incremental seat cost for the airline is nothing. So they have this temptation to try to fill the last seat at any price. And if you get four or five guys that trying to fill the last seat at any price you do not get very good prices.

Charlie Rose: And these go down.

Warren Buffett: It's structurally set up so that it's very, very difficult to have a sustained competitive advantage. And you get this enormous fixed investment in planes. Now you've got the plane. It cost you a couple hundred million and you're trying to fill a seat and you read in the newspaper today what your competitor is charging and you have to charge the same price. It's got terrible structural aspects to it. And I bought into it.

Charlie Rose: You also bought into the railroad industry.

Warren Buffett: Yes.

Charlie Rose: Freight carrying railroad industry.

Warren Buffett: Yes.

Charlie Rose: Burlington --

Warren Buffett: BNSF.

Charlie Rose: Burlington --

Warren Buffett: -- Northern Santa Fe.

Charlie Rose: -- Northern Santa Fe, right. Why did you do that?

Warren Buffett: Well, the railroad industry carries 42 percent of all tonnage intercity. It carries -- carrying a ton of cargo 500 miles on as gallon of diesel. I mean it's an enormously efficient way of moving things. And now you have four huge railroads in the United States. They're not going to build any more of them and it will be the backbone of the movement of goods 50 years from now or 100 years from now.

Charlie Rose: What's this history with derivatives?

Carol J. Loomis: Well, he has a checkered history with derivatives, I'd say. First of all, one of the best stories in the book is from 1987 right after the crash of '87 and it's a letter that he wrote Congressman Dingle in which he warned --

Charlie Rose: John Dingle.

Carol J. Loomis: -- right. Absolutely -- in which he warned about what could happen with index -- trading futures -- index trading futures -- trading of index which was just then being about to be approved by Congress and was approved by it. And Warren warned about that and if he had been listened to I think we would be far better off today and he has always -- so that's an early thing about derivatives.

Charlie Rose: So you saw him -- go ahead.

Warren Buffett: I think I actually wrote the letter in '82.

Carol J. Loomis: Well, you wrote in the '82 but we printed it in '87 after the crash.

Warren Buffett: After the troubles.

Carol J. Loomis: Right.

Charlie Rose: You wrote the letter but it wasn't printed until '87?

Carol J. Loomis: "Fortune" printed it and ran it. But then on derivatives, what I say about Warren is that he really cannot ignore securities that have -- are mispriced. I think that he has --

Warren Buffett: You noticed that, huh?

Carol J. Loomis: You know, he doesn't go out and buy raw cotton or anything like that, or not very often. But derivatives in his eyes have often been mispriced.

Charlie Rose: Missed opportunity for him.

Carol J. Loomis: So on the one hand -- on one hand, he will be writing in the annual report warning about derivatives and over on the other hand he'll be buying those that are clearly mispriced.

Charlie Rose: Mr. Buffett, I plead you.

Warren Buffett: Well I -- we have 200 -- I know every single derivative we own and they're all the product of my purchase. Now, we've bought a company called General Rhee which had 23,000 and it cost us \$400 million before we got out of those. We tried to liquidate every one -- there's still a few --

Charlie Rose: As fast as you could.

Warren Buffett: Absolutely. But the 200 and some that I picked, you know, I think we'll make money on. But I'm familiar with every one of those. I think when you have an -- well Lehman had probably a million and you get huge counterparty risks. General Rhee when we went in -- we had over 900 counterparties. I didn't know who 300 or 400 of them were. I couldn't pronounce their names. I mean that is not my idea of prudent finance.

Charlie Rose: Doesn't Dodd-Frank speak to derivatives?

Carol J. Loomis: It does, to some extent. But I'm like Warren, I haven't read the whole thing and I have not written about in which case I really would have an opinion. But I could not express a strong -- the Volcker Rule appeals to me.

Charlie Rose: Does it appeal to you?

Warren Buffett: Yes, it appeals to me.

Charlie Rose: It's the right thing?

Warren Buffett: In general. Yes. I think -- no but I think -- I think the more banks stick with just pure banking the better I like it. I mean they have a franchise from the United States government in that people look at their deposits as guaranteed by the U.S. government. That's not totally correct but that's what they -- and when you have the ability to take in money from people who feel that they have the U.S. government behind it, they're going to give you money whether you're credit worthy or not. And therefore you need some real regulation to make sure that people don't go wild with that franchise. And banks with those funds and with that trust can some do some pretty extreme things. Particularly when they've got -- the upside belongs to management. I don't worry about moral hazard with stockholders. Stockholders get killed in all these banks but the management's made lots of money and they didn't go away broke.

Charlie Rose: How do you assess -- I mean, this is part of that, I think-- what happened in 2008 and the subprime?

Warren Buffett: Well, it wasn't just subprime but it was -- we left --

Charlie Rose: That was part of it.

Warren Buffett: We had a housing bubble like the world has never seen. Well, housing was \$22 trillion at the peak out of maybe total assets in the United States of \$60 trillion or something. So it was an enormous asset. 50 million people, families, had borrowed against that and they borrowed \$11 or \$12 trillion. So you had an asset that had a huge bubble that was owned on margin, basically. And people thought it could do nothing but go up just like in the '20s they thought stocks could do nothing but go up. So when that bubble burst -- not only in housing -- it just started rippling through the economy. And we found out that almost every company in the United States was a big domino and they were lined up very close to each other and they started toppling.

Charlie Rose: Do you believe the executive there knew what they were doing?

Warren Buffett: Well, they did not see the consequences of the dominos starting to topple. I mean people -- when the dominos topple, eventually they get to everybody and people did not realize how big they were, how close to each other they were. I mean people looked at Freddie and Fanny which were the first ones to get in trouble in September, more or less. And then WaMu then Lehman and then Merrill was going and all of a sudden people realized if they had bank lines that (INAUDIBLE) it wasn't going to happen so it was as close -- to the wildest panic I ever saw.

Charlie Rose: The wildest you ever saw?

Warren Buffett: By far.

Charlie Rose: You got out of the hedge fund business in --

Carol J. Loomis: 19-- end of 1969.

Charlie Rose: You got out because?

Warren Buffett: I got out because I didn't -- I had a good record up until then. I had all these people counting on me and I thought things were getting very speculative and I didn't know how to make money in that period and I was competitive enough to feel that I didn't want to do lousy compared to other people and yet I didn't want to do the things they were doing. So the only thing to do was give the money back and I gave the money back.

Charlie Rose: What do you think of hedge funds today?

Warren Buffett: Well, I think that -- I made a famous bet that Carol has been keeping track of where I'm betting that hedge -- a large group of hedge funds, funds of funds will underperform the S&P over time.

Charlie Rose: What's the bet?

Warren Buffett: Well, we've got a million-dollar bet for charity actually out in -- something called long bets. But calling yourself a hedge fund does not make -- it gives you no special way to make money and the fees associated with it are very, very high. And I'm -- I do not think the results of hedge funds in aggregate will be better than the S&P which you can buy for --

Charlie Rose: In the couple years that you didn't do as well as the S&P.

Warren Buffett: Well, there's been a number of years. Yes.

Charlie Rose: How does that make you feel?

Warren Buffett: Makes me feel like I better do better next year. I mean that's my job.

Carol J. Loomis: Have you noticed he's competitive?

Warren Buffett: I wouldn't be in this business if I wasn't. Over time --

Charlie Rose: There's also the question which always is asked of you is succession. You have said the board of directors knows who my successor is as of this moment.

Warren Buffett: They know tomorrow. If I die tonight, tomorrow morning they will appoint somebody they know.

Charlie Rose: and the person they appoint does not know he is the one to be appointed.

Warren Buffett: That's correct.

Charlie Rose: And will the role be the same role that you have?

Warren Buffett: No, it will be half my role. It will be running the businesses and there will be -- Todd and Ted (INAUDIBLE) -- they will run investments. They will run investments. My job will be split.

Charlie Rose: But is running the businesses as important to you as the investment aspect of it which you grew up on?

Warren Buffett: Well, running the businesses will be more important over time, sure. It is right now.

Charlie Rose: But does it have the same psychic imprint to you --

Warren Buffett: Running a business has more psychic satisfaction.

Charlie Rose: This friendship with Bill Gates, you and I have talked about this many time, with you and with Bill. But for this audience at this moment -- from the moment that you two had dinner together at Bill's mother's house and Bill's father started asking questions about what was the quality that most admired and I think Bill said focus.

Warren Buffett: We both answered focus. Yes.

Charlie Rose: And then you make a decision that when it came time after Susie's death that you wanted to do what she would have done to make -- do philanthropic contribution you chose Bill because you thought that the Gates Foundation did it right?

Warren Buffett: I chose five foundations but the Gates was the largest one.

Charlie Rose: Big one. But the friendship itself is born out of what?

Warren Buffett: Well, I'm -- it's like with Charlie Munger, you find the other person very interesting. You find them trustworthy. I mean you have a good time with them and -- but it's important to point out that there are five foundations. I just doubled what I give to each one of my children's foundation. So they have over two billion each there but they couldn't scale up the same way as Bill. He's operating on a scale.

Charlie Rose: And the amount for Bill's Foundation --

Warren Buffett: Yes, it would be -- it's probably still about the same. It's five percent of a declining balance so if a stock goes up more than five percent a year the amount actually keeps increasing.

Charlie Rose: What is it -- knowing this man as long as you have, shared as many conversations as you have, what are you curious about with respect to him?

Carol J. Loomis: Well, I don't see how he has as much energy as he constantly has. I think he draws energy from being out like talking to you. He's amazing about that. I worry about my getting tired while he's just out there just running around all the time. What am I curious about? Well, I wonder what he thinks in his innermost thoughts sometimes about some of his maybe not perfect investments. But I'm not curious about a lot because I know an awful lot.

Warren Buffett: She knows every chapter of the book. Believe me, she knows -- she knows it all.

Charlie Rose: I know a lot of it.

Warren Buffett: I know you do.

Carol J. Loomis: And you know, doing the book, as a matter of fact, kind of refreshed everything that I knew.

Charlie Rose: There was this item, too. Berkshire Hathaway has overcome General Electric. It's now the sixth largest company in terms of market value? Market cap?

Warren Buffett: I mean look -- that doesn't surprise me in this area.

Charlie Rose: Does that mean anything to you?

Warren Buffett: Well, it means --

Charlie Rose: I bet it does. I bet it does.

Warren Buffett: What it means -- what means something is having it outperform the general market over time. I mean that -- my job is to do better for my investors than they would do if they were doing it themselves. And since we retain all the earnings, we've gotten very large, but we'll get a lot larger.

Charlie Rose: When you first met him, I think Berkshire Hathaway was \$22 a share, something like that?

Carol J. Loomis: That's right.

Charlie Rose: It is now \$133?

Carol J. Loomis: I don't know what it is today but \$130,000 a share. And that's the same stock, \$22 to \$133. It's remarkable.

Charlie Rose: Let me just come back to the nation's health and the global economy. Europe?

Warren Buffett: Europe is still drifting downward to some degree. I mean we have businesses that operate worldwide and actually Asia's coming off the best rate of growth but they're coming -- they're coming down somewhat.

Charlie Rose: No longer in double digits?

Warren Buffett: Europe has been sliding, you know, for some time and the U.S. actually is I would say strongest relative to where it was six months ago or nine months ago. The housing is coming back big time.

Charlie Rose: And the emerging nations? I mean even Brazil, they're all higher.

Warren Buffett: Yes. But five years from now, ten years from now, the world everywhere will be doing better, in my view.

Charlie Rose: Because?

Warren Buffett: Just because capitalism and market systems work. I mean it's been working since 1776 here and it wasn't because we had stimulus programs in 1794. It's because, you know, a system -- our system unleashes people's potential and we've got 312 million people that want to do better tomorrow than today and over time that works. Human potential is still untapped to a big degree and our system does unleash it over time. We do it in fit and starts but this country goes forward and it will continue to go forward. The luckiest person in history on a probability basis, in my view, is the baby being born in the United States today.

Charlie Rose: More so than China? More so than places where the base is lower and they'll have a greater opportunity to --

Warren Buffett: Yes.

Charlie Rose: What has created the most number of billionaires in the last three years?

Warren Buffett: I don't know about the last three years but finance created a lot of them and I would say that relative to their contribution to society, a disproportionate number --

Charlie Rose: Well, that's a point that's made. Some people argue that the financial sector is too large a percentage of our economy.

Warren Buffett: When you get a huge capitalistic system, just the crumbs that fall off the table can make people very rich particularly if they're very good at getting other people to hand them their money and if they get favored tax treatment and a bunch of things. I said a long time ago that if you want to get rich per point of IQ and per erg of energy, just hold your nose and go to Wall Street. There's a certain truth in that. That doesn't mean they're charitable people or anything like that, it just means the payoff there is so much greater relative to what you bring to the party than it is in most aspects of society. Take journalism.

Charlie Rose: Buy newspapers, community newspapers?

Warren Buffett: Yes.

Charlie Rose: Is that simply because you had an opportunity to buy from that particular company, a number of them? Or you believe in something or simply just like Rupert Murdoch, it's in your blood.

Warren Buffett: Well, it's in my blood but I won't pay a price that reflects the fact that's in my blood.

Charlie Rose: Have you ever paid -- I mean I believe you could argue that Rupert, for example, would buy something because he had to have it and pay more.

Warren Buffett: That's right. That's right.

Charlie Rose: Believing that he could make some kind of efficiencies and he'd still have it. Have you ever done that? Ever paid more than you've --

Warren Buffett: No, I wouldn't do in the Berkshire Hathaway.

Charlie Rose: That's what you owe to your stockholders?

Warren Buffett: Yes, I mean it's their money. That's why we don't take an editorial -- I don't dictate an editorial position to the newspaper. I voted for Obama. We have 12 newspapers that endorsed -- ten of them endorsed Romney and, you know, I'm the CEO. But two papers endorsed Obama who I voted for and ten endorsed Romney.

Charlie Rose: Speaking of Obama, the President, do you think he'll be different in the second term?

Warren Buffett: Somewhat. He won't --

Charlie Rose: What makes you think that and how?

Warren Buffett: Well, I think second terms are different than the first terms. I mean first terms --

Charlie Rose: Sometimes they can be full of land mines, too.

Warren Buffett: They can be. But in the first term to some extent you and your party have to be thinking about your re-election, I mean. And a second term certainly frees up that aspect of it and then the question is how effective you can be in getting Congress to work with you.

Charlie Rose: I mean you have access to him. He calls you and --

Warren Buffett: I've never called him. I've never called the President.

Charlie Rose: But say he calls and you go and you talk to him on the phone. And you go meet him and other CEOs. Do you think he has a new attitude about business that's come about because of the first four years?

Warren Buffett: I think that in the first term he felt that business misunderstood him and I think that business felt that he misunderstood -- they were misunderstood. I think they --

Charlie Rose: Do you think he believes and understands that business is the place where jobs are created?

Warren Buffett: Oh, there's no question about it. He knows he's dependent on capitalism working and that business is part of that. I think to some extent when people do feel misunderstood by the other party it can develop its own dynamic.

Charlie Rose: That's what happened here.

Warren Buffett: And I think that -- but I think both sides should just say forget it, you know. Wipe the slate clean and it's sometimes a good idea in human relationships. I think it's a particularly good idea when the country's well-being is at stake. So I would recommend both sides just say maybe I was misunderstood by you but forget it. We work together going forward.

Charlie Rose: But do you think he wants to do that?

Warren Buffett: I think he wants to succeed big time. And I think he will and I think the economy will be a help to him. But I think it's -- I mean that isn't -- you know, neither side can roll over in terms of the things they feel strongly about but I feel the rhetoric certainly should be very civil all the time and I think that you look for ways to work with each other.

Charlie Rose: Does this send a big signal to the country if he would appoint as Secretary of the Treasury someone like Jamie Dimon? Or Jamie Dimon?

Warren Buffett: Well, I think that that might be a big signal.

Charlie Rose: Appointing Jamie Dimon as Secretary of the Treasury?

Warren Buffett: Well, I think Jamie Dimon actually would be -- I think he'd be terrific because I think he -- I think he -- if we did run into problems in markets I think he would absolutely be the best person you could have.

Charlie Rose: He knows that much about markets --

Warren Buffett: And I think world leaders would have confidence.

Charlie Rose: So when you see a problem that Jamie's had with London and the (INAUDIBLE) all that, what do you mark that up to?

Warren Buffett: If you're running a \$2 trillion institution -- if I run Berkshire for decades, some things are going to go wrong. I mean if you run an army, if you run a church, if you run a government, any large institution people go off the reservation sometimes and sometimes they'll get away with it for a long period. And of course, when you work in a financial institution you can add a lot of zeros very quickly. So, you know, obviously there was a failure of control but there had been failures of control at Berkshire. I am going to make more mistakes. I hope I minimize, I hope I catch them fast but there can be mistakes and there can be big mistakes.

Charlie Rose: Should Bowles-Simpson be the operating model from the menu that they operate on and do you believe that's the direction to go?

Warren Buffett: Well, I think the menu should be something that raises 18.5 percent of GDP in revenues and embodies -- with no loopholes, basically, the idea of a progressive tax system and I think that expenditures should be reduced to the 21 percent of

Gdp Level: Do you want to eliminate the deficit or the debt?

Warren Buffett: It eliminates -- it does not eliminate the annual deficit.

Charlie Rose: Right.

Warren Buffett: It keeps the debt as a percentage of GDP constant.

Charlie Rose: and that's what we can live with in essence.

Warren Buffett: We can live with it. The net debt is in the 70s. It's around 73 percent or something like that. That's what we always talked about until everybody got excited lately. That was 120 percent coming out of World War II. And it will stay in the 70s, might even come down into the 60s if we -- the 18.5 percent and 21 percent won't increase the ratio of debt-to-GDP. And it may very well bring it down slightly.

Charlie Rose: What has this meant to you this friendship with Warren Buffett?

Carol J. Loomis: Oh well, it's been a wonderful friendship. Can you imagine the chance to Warren Buffett about almost anything? To ask his opinion about every story you've ever had on your mind? It's -- it's priceless. And it's been priceless in a way to go at this book and to see it all put down again, to add my introductions and to see how good fortune was at staying with this man as -- as I say, we were standing by while Warren Buffett was becoming Warren Buffett. and it was a remarkable thing that we were allowed to do and I loved it.

Charlie Rose: I'm smart enough to give her the last word.

Warren Buffett: You are smart.

Charlie Rose: This book is called "Tap Dancing to Work: Warren Buffett on Practically Everything"; from 1966 to 2012, collected and expanded by Carol J. Loomis. Thank you.

Warren Buffett: Thank you, Charlie.

Carol J. Loomis: Thank you, Charlie.

Charlie Rose: Thank you for joining us.

Warren, Howard G., and Howard W. Buffett (2013)

10/22/2013

Charlie Rose: and a longtime friend of mine and this program. His genius as an investor made him one of the world's wealthiest men. He pledged to give away most of his fortune and donated \$31 billion to the Bill and Melinda Gates Foundation in 2006. He's also encouraged his children to engage in philanthropy. Warren Buffett's son Howard Graham is the Chair and CEO of the Howard G. Buffett Foundation. He's also the author of a new book, it is called "Forty Chances: Finding Hope in a Hungry World." His son, Howard Warren Buffett, is a lecturer at Columbia University and trustee of his father's foundation. He's contributed to the book with his own experiences in policy making and philanthropy. So I'm pleased to have all of them here together at this table for the first time -- grandfather, son and grandson. So how does it feel?

Warren Buffett: It feels great.

Charlie Rose: It really does.

Warren Buffett: Yes, yes, I am very proud of them.

Charlie Rose: You talk about that in your introductory remarks. So let me just start with the book. Clearly because I knew your mother and understood how -- what's -- what's involved here is what you have learned, but also what you learned in addition from them. Give me a sense of what it was that you were trying to accomplish with "Forty Chances".

Howard G. Buffett: Well, you know, both my mom and dad were phenomenal in terms of the opportunity they have given me and my brother and sister. And in my case, I spent a lot of time traveling around the world and met a lot of people, seen a lot of things and I just felt that, you know, those experiences are something that hopefully are worth sharing. I -- I start out with the idea of doing a textbook and Howie told me, he says "Dad you have to think a little bigger than that." So I -- I just thought that, you know, sharing some of the experiences and, you know, we have tried a lot of different things and we have failed at more than we've succeeded and I just feel like that's an important message.

Charlie Rose: You can learn from failures?

Howard G. Buffett: Absolutely, yes.

Charlie Rose: Why the title "Forty Chances?"

Howard G. Buffett: Well, I was going to something that most of your viewers will not get too excited about it's called Planter's School and it's a -- you go in the winter time and you go to the John Deere dealership and sit down and different speakers will try to tell you how to improve your -- how you do on the crop.

Charlie Rose: Right.

Howard G. Buffett: And you know, he kind of talked about how you only really have 40 seasons -- 40 growing seasons to do the best job you can. And I kind of then translated that into thinking about well you really have about 40 really prime years.

Charlie Rose: Yes.

Howard G. Buffett: I was joking and say he has 80.

Charlie Rose: Yes I know -- in this dad.

Howard G. Buffett: Yes, but, you know, a little Eveready battery but, you know, the truth is most people have, you know, in their prime they have about 40 years to really change things or achieve their goals or whatever it is they want to set their sights on.

Charlie Rose: You still consider yourself first and foremost a farmer.

Warren Buffett: I love it, yes.

Charlie Rose: Yes.

Warren Buffett: Yes, I would never want to give it up.

Charlie Rose: When you were last here and we talked with Warren, you said you were in the middle of a transition to impact decision makers more effectively, is this book the culmination of this?

Howard G. Buffett: This book is a big part of that. Yes, I learned a lesson particularly working in conflict areas and there is where you really have to have government engagement that you know if you don't -- if you don't impact policy, you know, if you are working -- you can have great people but if you are working under really poor policy they are not going to succeed. So we really started to embrace advocacy as part of our tool.

Charlie Rose: Yes and you believe that we can do a significantly better job at trying to eliminate poverty?

Howard G. Buffett: Absolutely. I think one of the things is we have been living too much in history and you know, technology has changed but also I think thinking has to change and thinking is changing, I mean you know, the younger people in philanthropy today think differently. They are more innovative I think they are more focused and those -- those people that are thinking and driving that way, I think have to help change some of the bigger organizations.

Charlie Rose: I'm amused at what Warren once said that it's better if you give away your money while you can make the decisions before you are 90 and drooling with a blonde sitting on your lap.

Warren Buffett: That's right. That's right. I try to try that one too. I think I got the drooling part down, where is the blonde?

Charlie Rose: There is also your mom. And as everyone I think knows, we did a wonderful conversation with her before she died, and here is an excerpt of that in which we see her and her impact on the family. Here it is.

Susan Thompson Buffett: I think he hopes that people remember how much he liked to talk about the ovarian lottery he does that. And I believe that so deeply like he does, and if he can make young people realize I'm lucky I was just going here and then take it a step further and what can I do for people that are not so lucky including people here, I know that means a lot to him.

Charlie Rose: So you say this, Warren, in the introduction, "In this ovarian lottery my children received some lucky tickets. Many people who experienced such good fortune react by simply enjoying their position in life and try to make sure that their children enjoy similar benefits. This approach is understandable but it can be distasteful if it's accompanied by a smug 'if I can do it why can't everybody else' attitude." Emphasize or help us understand the significance of the ovarian lottery, because, it says something about how lucky we are to be born in this country.

Warren Buffett: Charlie I was born in this country and the odds were 30 or 40 to one against it when I was born in the 1930. If I had been born some place else my life would have been nothing like it has been here.

Charlie Rose: It was the allocating capital.

Warren Buffett: I would be wandering around in Bangladesh saying I allocate capital and looking for a job.

Charlie Rose: And was sign up for --

Warren Buffett: You know I was -- I was fortunate with my parent. I was fortunate at the time I was born. You know, I happen to be wired in a way that works very well on a big capitalistic system. I've had all kinds of good luck. It could have been, you know, dramatically different.

Charlie Rose: But millions of other people haven't had that. They have not benefited from the ovarian lottery.

Warren Buffett: Obama got a certain amount of criticism when he said you know nobody does it alone. Well I -- I don't know about other people I did not do it alone. I mean there are -- there are 10,000 crosses over there at Normandy that -- and they will need to be where I am today. There are people of Gettysburg, I mean, it's -- none of us do it alone. And I have been very, very lucky to be sort designed for this time and this place. But a lot of people aren't lucky and the market system showers things on me and it leaves an awful lot of people behind.

Charlie Rose: I should take note of the fact that son and grandson are named Howard.

Warren Buffett: Yes.

Charlie Rose: Your dad is named Howard as well, your hero in life.

Warren Buffett: Yes. Absolutely. Yes.

Charlie Rose: The idea is that you can do what if our goal is to eliminate poverty, to a large extent? What's the step that we ought to take? And I will bring in your son in a moment.

Howard G. Buffett: Yes, I think part of what I try to write in the book is use our experiences and talk about some of those answers. I think when philosophy kind of clashes with reality, which what we've seen in our Congress recently you know reality with those people living in reality kind of lose. And so you know we need to have more serious leadership in terms of addressing this issue. So when people talk about cutting the SNAP program, you know, those people don't suffer the consequences from that action and they need to understand who does suffer those consequences. So really, awareness and advocacy are a key thing in terms of the policy. And then, you know, another thing we need to do is we -- I always say, you know, historically, business has been kind of the bad guy and in philanthropy people have looked at it and said well you know, I can't -- they are doing this or they are doing some things so I can't really partner with them. And the truth is businesses create jobs and jobs are what permanently bring people out of poverty. Now it's not that simple in a lot of cases but we have to have a different mindset about what some of the solutions are.

Charlie Rose: I -- tell me about you and what you've learned and your role in this book.

Howard W. Buffett: Well, I am just honored to be involved and over the last 15 years I have been able to travel with my dad around the world and take in so many experiences and that's a part of what we've tried

to capture in "Forty Chances". But for me growing up I have had the two most incredible role models anyone could ask for and -- and you know, we sit around at Dairy Queen at family brunch and have conversations but they are -- they are still unbelievable individuals. You know my grandfather built what was one of the world's greatest fortunes and turned it into one of history's greatest gifts. And in doing that he empowered my dad to try and change the world and -- and that opportunity is what my dad has used to share with me to try and improve lives everywhere.

Charlie Rose: Tell me about your visit to Prague in 1969.

Howard G. Buffett: Yes, that was a -- that was a big change in my life and one of the best things I ever did and I wouldn't -- I wouldn't have gotten it done if it wasn't for my dad because my mother did not want me to go and we argued and argued.

Charlie Rose: At the time --

Howard G. Buffett: Yes, I had no concept of what was going on in Prague, I just know that Vera who stayed with us as an exchange student said come on over. So I said I want to go over and you know I am flying in, it's one of those kids where the mood changes quite -- quite quickly because I am flying in and I am looking at you know I love big -- big machines and you are landing and you've got all of these tanks and all of a sudden this is really cool and then when I am standing face to face with the soldiers who was looking for ID I am going boy this is not so cool. And so you know but I learned so much, you know, I didn't get three meals a day.

Charlie Rose: Yes.

Howard G. Buffett: We boiled hot water on Sundays to take a bath. I mean, you know, it was just so different and -- and you saw people who were subdued, people who were beat up by secret police, I mean I saw all this and to see it is different than reading a book and so it really changed, you know -- it is the first time I felt helpless. And then I felt like I really should be doing something but I can't do anything and I think you know later on in life that really stuck with me.

Charlie Rose: What is it that makes you proudest?

Warren Buffett: Well I am proud of all three of my children but they -- but that they don't have to do what they are doing. I mean they don't have unbelievable amounts of money but they have enough so they can -- they can spend their time in a country club or something of the sort.

Charlie Rose: Right.

Warren Buffett: And then Howie I don't know how many countries he has been in, but -- but he is -- he is trying to help his fellow human being. Unfortunately, I've got somebody that can help him do that but -- but the energy and the imagination and learning from mistakes and all of that belongs to him.

Charlie Rose: One other thing you have other than this sort of instinct for farming and agriculture and experience and learning is photography and we will see a couple of things here, several things. Tell me, your wife introduced you to cameras, yes?

Howard G. Buffett: Yes, yes.

Charlie Rose: And what did it do for you? What did it turn you into?

Howard G. Buffett: I think for one thing, she -- the first thing she would tell you is it taught me some patience. If you want to get a cheetah on a kill you have to wait. And --

Charlie Rose: Cheetahs are not about waiting for you.

Howard G. Buffett: No that is exactly right there is no remote control that you could like yes. So it did, it taught me some patience but I -- you know I just saw -- I started seeing things, you know, on the farm originally that I just kind of wanted to capture. And then when I started traveling and originally we did a lot in conservation so it was a lot of fun. You know, the elephants and cheetahs and lions and all of those things that kids like to see and we all love. But, you know, then I've learned that photography is a really powerful tool to change people's minds, to make them -- you can't -- if you've got a strong enough photograph, people can't turn away from it. You can't deny that it's happening and so to me, it's -- I think I write in the book if I remember right that it's look truth gun. I mean it just you know it -- it really forces people to deal with the reality.

Charlie Rose: As somebody said effectively a picture is worth a thousand words.

Howard G. Buffett: Yes, absolutely.

Charlie Rose: Ok take a look at some of these. These is a -- I want you to describe the photograph. This is an emaciated veteran saluting a flag.

Howard G. Buffett: Yes this is Everett -- this is Everett in West Virginia. Everett was one of those circumstances where I had not gone to really photograph Everett but we saw him and came out to get his mail and I saw his ribs and knew he was malnourished. And so we turned around and went back and that picture is really interesting because I was on the other side of a very busy road waiting to cross, my colleague had already gone off he's standing at the bottom of the stairs there and I yell across the street, I said ask Everett if he's a veteran because he had the flag and immediately what he did is he saluted. And then we spent quite a bit of time talking to him but he is an example of somebody who served this country and hasn't been treated fairly.

Charlie Rose: Here is a picture of a boy you photographed in Senegal who was in chains. What is this story?

Howard G. Buffett: Yes this is a -- this is where my camera almost got me in a lot of trouble.

Charlie Rose: Yes.

Howard G. Buffett: We got in, I was able to take one camera, it was amazing we got into this area of about 40 or 50 young boys in shackles and chains and they basically are caught in a religious system that their parents give a child to the who is the head of the religion there. And basically those children beg for money, if they don't get enough money on the street then they are treated like this.

Charlie Rose: Ok the third slide is a picture of a woman in Armenia, 82- year old Anna.

Howard G. Buffett: This is Anna. I think Howie should tell you this story.

Howard W. Buffett: Right you know we had been driving through the country side in Armenia for hours at this point and I think almost by happenstance we stopped at this house and we were invited in by Anna. And she told her story about her sister who was mentally ill that she had to lock up at night because her sister tried to kill her. And what you are seeing is you are -- you are seeing her standing in both her kitchen and her bedroom and her porch all at once there. And it was one time that I had an incredible difficulty with it, because whatever it was about the situation it just -- it hit me so hard emotionally and, you know, my dad and I have seen indescribable instances around the world and Anna's story just touched me in a way I was not expecting.

Howard G. Buffett: Charlie if I could add really quickly, I told Howie we are in south -- I said on the way home we are going to go Armenia. And he said Dad, I don't want to go to Armenia and what's in Armenia and he really didn't want to go and I said you know I was just there.

Charlie Rose: Generational difference there.

Howard G. Buffett: And you know, I said you are going to see something you've never seen. I have taken him to Bangladesh and India and all of Africa and central America and what I wanted him to see was a society that when you talked to people, you know, this is -- this was a situation where people had good jobs, we talked to professors who are out of work we -- you know, they have lost cars they've lost houses, they can't send their kids to school anymore. It is a very different environment than what we see in a lot of countries we work. And I wanted him to have that experience.

Charlie Rose: I think that's been one of the things that Bill and Melinda Gates have done is to travel and firsthand experience with their own eyes and their own you know visit.

Warren Buffett: Yes, yes you can't -- you can't sit in a building on Park Avenue and really understand this.

Charlie Rose: Yes. You believe -- what ought to be the debate about philanthropy now because the Giving Pledge has elicited some of that. People stepped up -- and they are having meetings as part of that in which they try to understand how to give more effectively. But do we need a bigger debate about philanthropy and how it can be applied and -- and why you should be engaged?

Warren Buffett: Well, philanthropy does not operate with a market system, I mean when we sell the Dilleys Bars at Dairy Queen we still don't know why the people like Dilleys Bars. The market system is wonderful in terms of the feedback it gives you on ideas and products and all of that and philanthropy you know if you are handing money to people, they are going to say keep handing it one way or another and they'll flatter you and do all kinds of things. So you get -- so you do not have a market system test and that -- that makes it much more difficult and you can do the wrong thing for a long time and nothing will stop it. So it -- it requires, it requires more ability than business.

Charlie Rose: Do we have -- it requires more ability to give money away than make it?

Warren Buffett: Oh, absolutely, absolutely. There is no comparison.

Charlie Rose: Yes. In fact that's why you gave the money to Bill and Melinda Gates because you --

Warren Buffett: And the children.

Charlie Rose: And the children because you were admiring of the fact that you could be effective --

Warren Buffett: The energy they would bring to it the intelligence, the lifelong commitment, I mean that's -- that's important.

Charlie Rose: So what's your role at the Bill and Melinda Gates Foundation?

Warren Buffett: Writing checks. Actually it is sending over stock certificates -- I just endorse them. But it is the same role I have with my children.

Charlie Rose: But you know, it's more than that.

Warren Buffett: No, no.

Charlie Rose: I mean you -- you have a sense of -- of wanting to inspire.

Warren Buffett: Well and -- but I wouldn't have joined with them if they didn't have the same goals there. Their philanthropy is grounded around the proposition that every life has equal value. And my children believe the same thing and -- and they are young and they are willing to devote their -- the rest of their lives to it as my children are doing. So I -- I've got these -- you know people working for me that do it far better than I would do it and I happen to love what I do. And fortunately that tends to increase the amount of resources available for philanthropy.

Charlie Rose: Still tiptoeing to work, are you?

Warren Buffett: Tap dancing, tap dancing to work, I am doing hand springs.

Charlie Rose: The Rockefeller Foundation was famous for the Green Revolution and its support of that.

Howard G. Buffett: Yes.

Charlie Rose: Are you, do you think that something like that in agriculture?

Howard G. Buffett: I think today where I call it the Brown Revolution, we -- we've got to start protecting our natural resources and soil is the key. I mean you can't -- you know, it is like if you want to go somewhere in a car you have to put gasoline in it or diesel fuel. You've got to -- you just have to have soil to grow anything and we've not done a good job of recognizing it. It's not sexy, soil isn't sexy so you know people don't think about it but --

Charlie Rose: You and Bill Gates thinks it's sexy.

Howard G. Buffett: Well I -- I gave Bill this book called "Dirt" I said read this and you will understand why soil is more important, but you know -- and you know, it's -- it's a challenge, because it's not what everybody thinks about but we -- we do have to pay more attention to how we're treating our natural resources and we want to be able to farm the way we farm in 100 years and then we've got to do it.

Charlie Rose: I want, one more time, because she was such a part of the shaping of the three of you, I mean you have said to me about Suzie, you know, that you once said to me you've got to meet her because I was a mess before I met her.

Warren Buffett: That's true, that is true.

Charlie Rose: This conversation took place not soon -- not later -- soon after this she passed away but here is her reflecting on the family and the values.

Susan Thompson Buffett: I think that's what made Warren a Democrat I take the credit for that, because both our parents were Republicans and we are not. And he would go with me to hear speakers, you know, Jesse Jackson and the man who wrote "Black Like Me" and Lewis. And he would go with me, and say -- oh I loved him, loved him, so without knowing it, step-by-step, I was infiltrating.

Charlie Rose: Yes.

Susan Thompson Buffett: And so -- and he is very much -- I find this a profound thing. I was talking to him one day about some racial issue and he looked at me and this, Charlie, would have been 40 years ago and he said to me, wait until women discover they're the slaves of the world. Now how many men are cognizant of that and even women?

Charlie Rose: Wow. Prophetic, huh?

Warren Buffett: Yes.

Howard G. Buffett: Charlie I watched that interview before I wrote this book.

Charlie Rose: Yes. It is throughout the book isn't it?

Howard G. Buffett: Yes. Yes.

Warren Buffett: I should point out she is just recovering from throat cancer and it affected her voice.

Charlie Rose: And this was June 2004. Let me talk about the world that you see now politically. We just went through a crisis in Washington.

Warren Buffett: A Washington-created a crisis.

Charlie Rose: Washington-created and demanding things before they would support not only a rise in the debt ceiling but also some other budgetary items. What is this doing, do you think, to the image around the world and people who either hold treasuries or, b, have looked to America for economic strength?

Warren Buffett: Yes. Well, I told my children and I think it's in the book that, you know, it has been 20 years building a reputation, you destroy it in 20 minutes. Well the United States spent 237 years building a reputation and that's why we have become the world's reserve currency, and people trust our full faith and credit. And for a Congress to threaten to destroy what took 237 years to build is just -- it's totally irresponsible. The debt ceiling -- it shouldn't exist, I mean, the way to have a ceiling on your debt is not to spend more --

Charlie Rose: My idea of a debt ceiling is negotiating over this.

Warren Buffett: It is not.

Charlie Rose: It's not.

Warren Buffett: But once you have it.

Charlie Rose: Yes.

Warren Buffett: If you're going to have it, it can't be used. I mean we have nuclear weapons but we're not going to use them, even if we get disappointed with other say. We don't say because this isn't happening not the way we want we are going to use a nuclear weapon. The debt ceiling is a political weapon of mass destruction and both parties should say it is off the table, you know. You know we can argue about abortion we can argue about immigration, we can argue about those things whatever it may be but we're not going to tie that to a threat to destroy a reputation that the United States has built up over 237 years. So I would ask both political parties to say it is off the table.

Charlie Rose: Do you think it's more likely that they will be listening because of the close call we had here?

Warren Buffett: I think maybe. You know, I -- I always have hope in humans and actually, Senator McConnell, who I don't agree with on many things, but he has -- he has introduced in the past, I believe, something that at least -- it will reduce the chance that the debt ceiling will be used as a weapon. And it should be eliminated entirely but if that's the best we can do politically you know more power to him.

Charlie Rose: Default would have been the weapon of mass destruction.

Warren Buffett: It just would have been plain stupid, it would you know, it would be -- it would be like using poison gas or something, I mean just because you weren't getting your own way. It is not something to be used as a weapon.

Charlie Rose: Ok. So now you have Democrats and Republicans and you have a commission, Patty Murray and Paul Ryan.

Warren Buffett: Yes right.

Charlie Rose: Are sort of chairing it.

Warren Buffett: Yes.

Charlie Rose: And they have --

Warren Buffett: And I think they are good people.

Charlie Rose: And they've got until -- and they know something about budgeting, because they are chairmen of their respective committees. You now have until December 13th, should they use Simpson-Bowles as a starting point?

Warren Buffett: Well, I think they can use that or something like it. I mean -- I mean their goal ought to be to get a lot done.

Charlie Rose: Ok and so what should they try to get done? Help me understand -- help them understand what a Buffett recommendation would be.

Warren Buffett: Well they are not going to get 535 people on board but they should do as much as they can toward both raising revenues where it won't hurt the economy and -- and I think looking at certain aspects of entitlement, if they want a means test of my Social Security I am all for it.

Charlie Rose: And a certain age too?

Warren Buffett: Yes probably. You can't look at one part of a program without looking at the whole program.

Charlie Rose: Right.

Warren Buffett: But -- but if they come up with a program that I am 80 percent in agreement with I will cheer them on. I mean nobody is going to be 100 percent in agreement. And that's their job. I mean whether within this time frame they can get it or maybe that will help get them done what's happened up somehow. But the job of the Congress, you know, is not to be putting up debt ceilings and shutting down governments and doing things like that. The job of the government --

Charlie Rose: They've got to find a budget now and they have to do that so that they don't have the debt ceiling crisis they had before.

Warren Buffett: Yes but they -- the first thing I would do if I were Patty Murray and Ryan -- Paul Ryan is, I would say, on behalf of our respective parties, you know, we are calling for absolutely taking the debt ceiling out of any future discussions, that tie up with anything else and I would say, we both said in the past, I would not get into this finger pointing stuff or anything of the sort. It doesn't make any difference who used it in the past, it is an inappropriate instrument to use.

Charlie Rose: And -- and you would say to Democrats we have to reform entitlements.

Warren Buffett: We should.

Charlie Rose: Because there is an article you saw in the "Wall Street Journal" a day or two ago saying, you know the liberal and Democratic Party saying no messing around with entitlements. The Republicans are saying don't cut taxes as long as you have those two positions.

Warren Buffett: It certainly has worked wonderfully so far taking that approach. Now I would say this, to the extent it can be done if I were -- if I were Murray and Ryan, I would try to do in this in private and come out with something of a package, because I think if you take it one by one, nobody wants to give on the individual points. So it is an enormous problem to have a debate in public when people are facing primaries in not that many months and that's what they are worried about. So I would try to come out with something close to a package that everybody just liked a little bit but overall we felt was good for the country.

Charlie Rose: So what is it you dislike that you would be willing to see in the package?

Warren Buffett: Oh, I -- I think that -- I think we have to make certain judgments about entitlements. I think we have to make certain judgments about taxes but how it's -- you know it's -- you can't really talk about one part of the package without looking at the whole package, that's why I would like them to come out with the whole thing.

Charlie Rose: Well let me just understand this too. I mean when you talk about we need to increase revenue, obviously, we do.

Warren Buffett: Yes.

Charlie Rose: You mean more than simply reducing deductions, you mean increasing rates?

Warren Buffett: Yes now the revenue has to go up to 18.5 percent or so of GDP.

Charlie Rose: Yes. Expenses -- that is a place it ought to be 18.5 percent of the GDP.

Warren Buffett: Yes expenses should be 20.5 or 21, we can take two -- 2.5 percent gap without GDP going up, without the debt going up as a percentage of GDP, there is nothing wrong with that. I have operated in a world like that, you know, since I was -- since World War II ended, it works. But it's not -- it's not impossible. We are richer than we've ever been, we're absolute -- you know, \$50,000 of GDP per person, I mean, we are way richer than when I was working 30 or 40 or 50 years ago. So the problem isn't that the country has become poor, the problem is that we have over promised and we are unwilling in some cases to raise the revenues to meet some of the promises that we probably should have.

Charlie Rose: \$50,000 means when we compare our per individual --

Warren Buffett: It's six times what it was when I was born.

Charlie Rose: And it's \$50,000 thereabouts and in China it's what 7,000 or 8,000.

Warren Buffett: Yes. I think it was.

Charlie Rose: Maybe even 4,000 or 5,000.

Warren Buffett: We are the richest family on earth. Imagine when my dad was in the waiting room in 1930 and somebody said that your son is going to live -- when the average is six times per capita what it is today. My dad would have thought it would be utopia. I mean it is unbelievable what we have achieved

in terms of learning how to turn out stuff, in terms of how we handle the stuff that we turn out. I mean we are enlightened a little bit.

Charlie Rose: Now I have to say that your son will have an income and a wealth larger than some -- a number of countries too.

Warren Buffett: Oh, things will -- this country has a wonderful future, Charlie and incidentally, 535 people can't screw it up. They may look like they're trying sometimes but they can't. They can't stop 315 million Americans. I mean America works, but it has certainly gotten gummed up in recent months.

Charlie Rose: But do the Chinese and people who own treasuries have somewhere else to go?

Warren Buffett: No, no. And America will pay its bills, I mean the full faith and credit of -- is still intact in the United States. I mean I think -- I think enough people have learned something from going up to the brink that we are going to -- it should just be ruled out entirely. Why worry about something that isn't going to happen? Why cause millions of people to worry about something that 535 know would be crazy and it won't happen? That doesn't make any sense. If I would say something on this show that I know isn't going to happen, and then cause worry for tens of millions of people that is irresponsible.

Charlie Rose: And the idea was that they're going to be able to defund Medicare, for example in the budget -- Obamacare.

Warren Buffett: They can say they want a new post office, you know, in Omaha and I'm not going to vote for this thing. It is just -- it's crazy.

Charlie Rose: But there is also this argument and tell me where -- how you see it because we have deficit hawks who talk about long-term debt that this country faces, and you have Larry Summers and others who are arguing that, you know, what we need to do is focus on growth and that the growth we will have will enable us to pay off the debt because that is not an immediate need and the immediate need is growth. Do you agree with Larry Summers on that?

Warren Buffett: We are having growth and we are going to continue to have growth.

Charlie Rose: But we need growth to meet the challenge of being

Warren Buffett: But we should not increase our debt over time at a rate that's faster than our growth. I mean we can handle the debt we have. We can handle the debt we have relative to our current output. But we can't keep getting debt grow at a rate that is faster than output, eventually that catches up with you.

Charlie Rose: What is an appropriate rate of debt to GDP?

Warren Buffett: Nobody knows exactly. But certainly --

Charlie Rose: What do you think?

Warren Buffett: -- but our net debt, people talk about close to \$17 trillion but our net debt is -- knock \$4 trillion off that. Our net debt is 70 odd percent of GDP. We came out of World War II with I think close to 120 percent -- I may be off a little bit on that. So nobody knows the magic level but you don't press them to the ultimate. I mean, you know. And if we stay at 72 percent or whatever it may be, of net debt to GDP that is perfectly ok, you know, it got down into the thirties not that many years ago starting from that 120 but we are fine. But it is a trend that should not continue.

Charlie Rose: How do you feel about sequestration?

Warren Buffett: Well, again, that gets into the, you know, sort of gets into the games that people play. I would just like them to focus on what this country needs, what they can do for the 315 million people. They are not all going to agree, you know. If they get a budget and you like 80 percent of it, I like 80 percent of it -- it won't be exactly the same 80 percent but we will feel ok. I mean we'll feel a lot better than having them play the games they have been playing the last few months.

Charlie Rose: But do you have a sense -- and I think you said yes -- that there may very well because of what Mitch McConnell has said and that others have stepped forward to say we cannot let this happen again. We just can't kick the can down the road.

Warren Buffett: It should be taken off. We used the atomic bomb twice in 1945. We faced all kinds of things since then. The Soviets have faced all kinds of things that really irritated them and they wanted to change in a big way. They did not drop nuclear bombs and this is a nuclear weapon of a financial sort. And it just does not belong in the repertoire of either party.

Charlie Rose: Do you believe we learned the lessons that caused the crash in 2008?

Warren Buffett: Well, we learned that bubbles will happen and when you get one in housing it can be a very big bubble. We -- people may get smarter in some respects. When it comes to fear and greed, I don't think they will change in the next few centuries, anyway. I will let you carry it out beyond that.

Charlie Rose: But interesting we just had a Nobel Prize in economic award and one man Fama, you know, believes that the markets can be ordered and that they are --

Warren Buffett: They are efficient.

Charlie Rose: They are efficient. The other -- Shiller says, no, they are irrational and we will have more bubbles.

Warren Buffett: Yes.

Charlie Rose: Where do you come down?

Warren Buffett: Well, the markets are generally quite efficient but they are not efficient and I think probably Professor Palmer would say that.

Charlie Rose: Yes.

Warren Buffett: Shiller is right that we will have more bubbles.

Charlie Rose: Yes.

Warren Buffett: This was a particularly extreme one because it involved the biggest asset class in the country that almost everybody had -- housing. And it also was leveraged to the hilt in many cases; people have refinanced their houses and everything. So you had a huge asset class, margined to the hilt. And when that asset class fell in price, I mean it hit tens of millions of people and financial institutions all over the world that lent based on everything. It was designed to be a huge, huge crash and we got it.

Charlie Rose: And do you think we have learned a lesson?

Warren Buffett: We have learned a lesson about that kind of bubble, I mean, you know.

Charlie Rose: And will Dodd-Frank help us next time?

Warren Buffett: I am not sure.

Charlie Rose: You don't think they have done the job that was necessary with Dodd-Frank -- -- to creating a regulatory structure that may be both a warning and preventing people from doing the kind of behavior that got them in trouble in the first place?

Warren Buffett: Fear and greed are pretty hard to control, you know.

Charlie Rose: Fear and greed triumphs over regulation.

Warren Buffett: After 1929, you know, we spent two or three years -- we had the FCC. We had the deposit insurance and did all of these things, looking at 1929 and, you know, we got 2008. I don't think humans will ever behave in a way where you don't get mass fear from time to time.

Charlie Rose: One interesting thing is that Tim Geithner is now having some speeches and private conversations who said we could not have done what we did -- Bernanke, Paulson, and me -- without the emergency powers that were given to use by the Congress. And then some people in the present debate want to stop that kind of power.

Warren Buffett: If you look at Dodd-Frank, I have read all 20 -- however many pages there are, but Bernanke used something called Section 13-3, I had a Federal Reserve chairman I won't tell you which one who told me once he said under 13-3 we can do anything. And the truth is we had to do almost anything. And Hank Paulson had something called -- what was it -- emergency stabilization fund. It was set up when they changed the price of gold back in 1943. That is the thing he used to guarantee money market fund. Nobody ever thought it was designed for that but they did it, you know. And who was going to stop them? I don't know whether the emergency stabilization fund allows that, but you had men there who would act and who had these authorities and to some extent, I believe, I may be wrong on this, that Dodd-Frank circumscribed some of those abilities that the fed and the treasury had and believe me they were important last time.

Charlie Rose: And they could -- they say so. There is also this, JPMorgan and a \$13 billion settlement. What do you think of that? Was that appropriate? Was it the right amount? Will it serve to send a signal?

Warren Buffett: I don't know what the right amount is but I know this. When a prosecutor tells you that a financial institution -- it was I think we got fined \$290 million when I was at Solomon. I had now negotiating power. Believe me, if they brought a criminal action against us we were out of business the next day and that would have had a lot of consequences. So you really have no -- you're like a wolf baring your throat, basically, if you are dealing in that kind of a situation. And I don't know where the numbers come from. I do know that in my own view, punishing JPMorgan for anything that happened in connection with Bear Stearns or WAMU I think is a terrible mistake. I mean maybe Jamie didn't get an indemnification agreement on Bear Stearns, but he was stepping forward at a time that the government wanted him to step forward and same way with

Charlie Rose: You think it is unfair?

Warren Buffett: Yes. I think if it relates to any of that, I think it is unfair. Yes, I really do.

Charlie Rose: I think they will argue there was more than that.

Warren Buffett: Well there was more than that probably but they have referenced, I think they have referenced the sins of Bear Stearns and WAMU in coming up with the number. And I don't think anybody in government was hoping that JPMorgan was going to walk away from Bear Stearns or WAMU. And I

think they could have -- they probably could have gotten an indemnification agreement if they wanted to, you know, take risks with the whole economy in terms of keeping the negotiations going. But, you know, they were asked to act in a very, very quick manner and they did and maybe they are getting punished for it now. I think, I will put it this way I think the system is better off because Jamie Dimon has been running JPMorgan straight through from 2008.

Charlie Rose: You say that because?

Warren Buffett: I think the guy has been a leader.

Charlie Rose: Because of the decisions he has made?

Warren Buffett: Yes.

Charlie Rose: In building the biggest bank in America?

Warren Buffett: Yes when Bear Stearns was going down he was there. And when WAMU was going down he was there. And those were important decisions not just in terms of those institutions but what they said to the rest of the world that somebody is stepping up.

Charlie Rose: Who pays for this -- \$13 billion?

Warren Buffett: Well, the shareholders will pay for it. And of course, they're not even the shareholders who were around in the past. That's the nature of it.

Charlie Rose: And if JPMorgan is today -- two other banks you have an investment in -- Bank of America and Wells Fargo might also be at risk.

Warren Buffett: Well, they have written big checks already, you know. The truth is if a regulator comes around you and you hold licenses in all of these states and maybe (inaudible), you do what they say. You know, you put up the best argument you have but you do what they say.

Charlie Rose: Well, according to what we have read, Jamie very much wanted them to also forego the criminal possibilities and they refused to do that so the criminal possibility is still out there.

Warren Buffett: Still is out there -- I don't think it will happen but --

Charlie Rose: But -- if they even think it's going to happen

Warren Buffett: I would not like running a financial institution with a threat of a criminal action against it but I did at one time.

Charlie Rose: The Solomon brothers.

Warren Buffett: I did it. And every day you wake up wondering whether the plug will be pulled.

Charlie Rose: When you look at what they did and in terms of the future, JPMorgan can absorb this.

Warren Buffett: They can absorb \$13 billion. That's why they got asked for it. If the exact same actions had happened at a place that couldn't have afforded \$13 billion, even --

Charlie Rose: They wouldn't do that.

Warren Buffett: No, no.

Charlie Rose: Do you think too big to fail is still with us? And should be with us?

Warren Buffett: I think -- yes, I think -- but too big to be punished -- the people that were active participants and walked away rich, you know. It is the shareholders of those institutions that pay, I mean the shareholders of AIG paid. They didn't have anything to do with the actions of AIG financial products. But people said the loss was a very significant percentage of their net worth that owned the stock. I think that if you run a major financial institution and you need the help of the government you and your spouse should go away broke. I mean all kinds of other people end up getting broke in these things.

Charlie Rose: That is not what happened.

Warren Buffett: No, that is not what happened.

Charlie Rose: How would you correct that?

Warren Buffett: Well, maybe -- Let me write -- I can write a statute if you gave me a little time.

Charlie Rose: What would it say?

Warren Buffett: Well, it would say that, it would have to be more drafted by somebody who knows more about that than I do but essentially I would not let any huge financial institution so important to the functioning of the United States that they had to go to the government and get saved. I would make sure that the CEO that led to that and the spouse walked away broke and I would say that the directors should at least have to refund everything they have earned in the previous five years or so. If that were there I think you would have more attention going into -- you know, you can say the downside to some guy that's got \$500 million and 100 million of the stock but that isn't -- you know, that is not real. It is the shareholders that pay for it and society that pays for it so, if you want to change human behavior, I think you change the penalty that happens to the humans whose behavior counts in that situation.

Charlie Rose: Yes, but I mean you are talking about financial losses to these people and they should go broke and they shouldn't profit from the decisions they made that ruined the lives and fortunes of a lot of other people is what you are saying?

Warren Buffett: Yes.

Charlie Rose: Should they go to prison?

Warren Buffett: That depends on what they did but I don't rule it out.

Charlie Rose: Do you think some did things that justified going to prison? You know more about this than most people?

Warren Buffett: Yes. That is hard to say, Charlie, I don't know the answer to that, but it is not inconceivable to me but I don't know the answer to that.

Charlie Rose: The Buffett rule is there.

Warren Buffett: Well, my assistant is called Debbie Bosanek -- so it's the Bosanek rule around the office.

Charlie Rose: And I know and love her.

Warren Buffett: As you should.

Charlie Rose: And there is also this though. I mean what is interesting in this has come up in this conversation and it is about a life or it's about financial doings. You don't want to go right where the line is -- you want to play in the middle of the field.

Warren Buffett: Sure.

Charlie Rose: And you don't want to do things that if they ended up on the front pages of "New York Times" your life would be ruined.

Warren Buffett: Absolutely.

Charlie Rose: As you say you can build a reputation for 20 years and you can destroy it in one moment.

Warren Buffett: Yes. And the United States almost did that here recently.

Charlie Rose: But you are optimistic about the country because of the innovation, because of the resources, mainly because of the human capital.

Warren Buffett: Just look at the last 237 years, I mean what does it pay to bet against America over any time? 237 years, you know, people say well you are betting on America. Well, who wants to bet against it? I mean just look at the record and we haven't come close to tapping our human potential. This country's best days lie ahead of us.

Charlie Rose: Tapping our human potential because science is moving forward so fast and every other kind of --

Warren Buffett: Everything, everything.

Charlie Rose: Now, here is the other interesting thing about your dad, who as you know I have had many, many conversations with. IBM, you made an investment in IBM, notwithstanding the fact that you always said I don't want to invest in things that have to do with technology that I might not understand. They have seemed to have run into a rough patch too.

Warren Buffett: Well, I am sure the Ginni Rometty is disappointed with some aspects of this year, but they are going to earn more money this year than they ever will.

Charlie Rose: And orders from China --

Warren Buffett: Some of it yes. But they will have a record per share earnings this year, you know. I mean, that can be disappointing if you expected more, but it is not a bad record, believe me.

Charlie Rose: And I mean this is a good place to talk in this conversation about that which is that, you know, you didn't invest in IBM because what you thought they might do and the stock price might do in the next quarter or the next quarter or the next quarter. You had to look at the fundamentals of the business and say they are on the right track.

Warren Buffett: I don't know what IBM earned in the third quarter of 1927 or 1962 or, I mean in the end every company, including Berkshire, you know, we have had a fair number of blips over time --

Charlie Rose: Right.

Warren Buffett: -- but if we go the right things we will get the right results over time and we are fortunate to be operating in the best country in the world. We got a tailwind.

Charlie Rose: And so does your son, "Forty Chances", and your grandson, with a foreword by you with references to your wife and your mother and your grandmother, "Finding hope in a Hungry World". Great to meet you. HOWARD

Warren Buffett: Thank you.

Charlie Rose: Great to have you back.

Howard Graham Buffett: Nice to be back.

Charlie Rose: Thank you, Warren.

Warren Buffett: Thank you, Charlie.

Charlie Rose: Back in a moment, stay with us.

Remembering Don Keough (2015)

3/30/2015

Charlie Rose: A young man named Don Keough worked for the Butternut Coffee Company when it was acquired by Coca-Cola in 1960. His life after that was never the same. Don Keough would go on to lead Coke as president and chief operating officer from 1981 until he retired in 1993. During that period, revenue rose to \$14 billion from \$5.9 billion and the average earnings gain was about 15 percent annually. Reflecting on his time at the company Don said, "I kept my head down. I jumped into a little creek which became a river which turned into a gulf which grew to an ocean. All I ever did was swim." He went on to become non-executive chairman of Allen and Company where he loved meeting young entrepreneurs from around the world who had plans for businesses. He remarked quote, "It is a lot of people betting on the future that keeps me young." Don Keough died last month at the age of 88 after a brief bout with pneumonia. Today we look back with an appreciation of his life. Joining me now four men who knew him: Muhtar Kent is CEO of Coke; Father John Jenkins is president of the University of Notre Dame; Timothy Shriver is chairman of the Special Olympics; and from Omaha, Nebraska is Warren Buffet, he is chairman and CEO of Berkshire Hathaway. I am pleased to have them here. Don Keough was a friend of this program as well and a good friend of mine. So friends celebrate him and appreciate him this evening. And, so, I'd like to begin with you, Warren. Tell me what he meant to you, because you go back further than any of us in knowing Don, who became a neighbor.

Warren Buffett: Yes, Don moved in right across the street from where I live now in about 1960, 1959, perhaps. And his front door was 100 feet from our front door and believe me, there was a lot of movement between those two doors. He was a wonderful friend 55 years ago and that friendship continued every day until just a week or two ago.

Charlie Rose: Here is an interview that he did with me talking about buying the house next to you, Warren. It's part of a documentary I did about you. Roll tape. How close did you live to the Buffetts?

Don Keough: Well, I lived across the street.

Charlie Rose: Across the street.

Don Keough: Across the street. I bought a house there in around 1959, a three-story house -- brick house, paid \$27,500 for it and there was a young fellow living across the street in a another house, a big house. He paid \$30,000, I think, for his. His name was Warren Buffett. Nobody knew who he was. He was a nice guy. He had -- I think he and Susie had three kids. We had four working on five. And you know, I got to know him. He wasn't easy to know because he -- you didn't see much of him but my kids did. Of course, the real story is he came across the street one day and he said, "Don, I love your kids." I said, "I know." He said, "You know, this is about college, you know, getting kids through college isn't easy." I said, "Warren, I'm working on grade school right now. I'll get around to college a little later." He said, "I've started a little fund, people putting money into it, and if you gave me say \$10,000, I think I could build that up into something." Well, Charlie, I didn't give it to him for two reasons -- one, I didn't have it. I could have borrowed it from my father. But I went in to Mickey and said can you imagine giving \$10,000 to a guy who doesn't get up and go to work in the morning? That was one of the great decisions of my life.

Charlie Rose: If you had given him that \$10,000.

Don Keough: Don't ask.

Warren Buffett: yes, probably over \$400 million.

Charlie Rose: About \$400 million.

Warren Buffett: We're still friends today.

Charlie Rose: Remember that, Warren?

Warren Buffett: I remember very well because I worked out of my house for about six years, a little sewing room off the bedroom. Every morning when Don would go off to sell coffee, his oldest daughter Kathy would come over and we had a jungle gym on the side there with the slides and swings and the last thing he would see before going to work was me pushing Kathy on the swing or her pushing me. I think that made him a little leery to give me the \$10,000 but when he came over later he asked if he could give it to me retroactively.

Charlie Rose: Did you ever remind him of how much it was.

Warren Buffett: Well, he seemed to do pretty well himself. It's kind of interesting -- it's kind of interesting that two guys living across from each other, you know, both living in houses that cost about \$30,000 and then he ends up being president of Coca-Cola Company and we ended up buying a lot of stock in it.

Charlie Rose: And we have the CEO here tonight to talk about that. You said three words to describe him -- "everybody loved him".

Warren Buffett: That's absolutely true. How many people 88 can you make that statement about? But everybody did love him. And it was intergenerational -- Charlie. I loved him. My two wives loved him, my kids loved him, my grandchildren loved him. I mean he could connect with anyone and he connected immediately and he knew more about people and human nature when he was 20 than I've learned in 84 years. An incredible man.

Charlie Rose: Muhtar, what did he mean to you?

Muhtar Kent: Warren is right. Everybody loved him. Everybody respected him. Everybody -- not just the customer or the truck driver or the store owner, heads of government respected him. He was just a wide giant of a person. I don't think I'll ever meet someone like that in my life. I think if you're lucky -- if you're really, really lucky someone like that comes across your life once -- if you're really, really lucky. And that's who Don was. I met him very early on, very early 80s when I joined the Coca-Cola Company in 1978. And ever since that time, you know, we had an incredible bond and close relationship. He taught me all I knew about what I had to know. When you think of Peter Drucker's book, "The Effective Executive", I think he wrote about Don Keough. That was Don Keough. And then he was much more that because he was also a wonderful family person, an incredible father, incredible statesman and he knew he could go up and down. He could go from 50,000 feet all the way down to zero and then go right back up again. So those are things that are not always learned. It's combined, he used to learn until the day he passed -- I know that, every single day. He would say, your brain is like a sponge, it just keeps taking it in. And you have to open it so that you can get more information every day. Again, you know, when I told my wife he'd passed, she started crying. That's how people so loved him.

Charlie Rose: Fair to say you wouldn't be in a position you're in without --

Muhtar Kent: Without any question that he was somebody that touched me and I've become what I am as a result of that.

Charlie Rose: Father John Jenkins? He had a close relationship with Notre Dame?

Father John Jenkins: Yes he did. And personally as with Muhtar -- he's a great man Charlie. I remember I had been president of Notre Dame for ten years and his saying, you know, "Stay nervous. Avoid complacency and hubris," kind of ring in my head and had a huge impact on me. I think one of the things Don gives you, gave me is he was very generous with resource but most importantly he was generous with his vision. He challenged you to be better and he had an inspirational way about him that made us better. That's why we have near St. Patrick's Day one of the great Irish study centers because Don insisted on it because he was a proud Irish-American.

Charlie Rose: In fact he said to you, you know, this great university doesn't have an Irish studies program --

Father John Jenkins: Exactly.

Charlie Rose: -- and it needs one.

Father John Jenkins: It's the "Fighting Irish" and you don't study Irish? We went from zero to the best of (INAUDIBLE) because of Don. But not because of teach Irish because of his vision. And that's what he gave you; he inspired you to do great things.

Charlie Rose: Special Olympics was what, Tim, 1968?

Timothy Shriver: It started in 1968. I'm thinking that probably we owe our success to this catastrophic -- that poor decision Don made with Warren Buffet's offer. Because my mother, an Irish-American, went to him right around the beginning of the Special Olympics movement, and probably said to him something like "I have about 10,000 athletes and I want to grow it." He probably heard an echo of Buffett's voice in the back of his and said, "I'm not making this mistake twice." I think what's -- I mean just two things jump out at me. First of all, you know, listening to people talk about Don and going to his funeral, Charlie, the thing that struck me was how many people talked about him as a dad. And this is a generation of men who grew up to be powerful in politics, powerful in business, powerful in literature and the arts -- they weren't really known, to be honest, most of them, as dads. This is a man who, when you look at the full story of his life, almost everybody refers to Mickey, almost everybody refers to his children and his grandchildren, almost everybody alluded to the fact he was always there at the Little League game, at the drama show. This is a man who somehow came through the 50s and 60s and 70s when the role of men was changing, when business was changing, when he was in the most competitive businesses in the world, really. Challenged to swim in an ocean, as he said; and still managed to convince everyone around him that his family was the most important thing in his life, which I find so inspiring to men today.

Charlie Rose: He had a close relationship with your mother?

Timothy Shriver: He did. He saw something about business I think before most people and my mom was captivated by this. He saw that business had to be about values, not just about bottom line. He knew that he could build his business if he had people who believed in his brands and believed in his products, who trusted his products, who understood that it was a promise and the promise wasn't just inside the bottle but it was all around the bottle. So my mother was enormously charmed. I mean the Special Olympics movement today is five million athletes, Charlie. But I'll tell you right now, it would not be where it is right now were it not for the fact that one corporate executive who had a global portfolio and who had a giant heart said this is something our business can believe in that will be good for human beings and be good for this company, too.

Charlie Rose: The heart there as an executive at Coca-Cola was reflected in all the global trips he made where he would go and see Coke employees around the world and bring the heart of the company to them.

Muhtar Kent: Yes. I mean Don got involved with the world of the globe in the 1980s when he really became the president and chief operating officer and, from that minute on, it was like he was the person -- the go-to person for everyone in the United States of America of what is happening in the world. So quickly -- how can someone just start this journey and become so quickly -- have that knowledge, have that inspired knowledge? And he basically always had wisdom that he was willing to share with everyone. And now the thing is, so, there wasn't a period of time when, after he retired, I would meet prime ministers, President Lech Walesa of Poland, President Vaclav Havel of the Czech Republic, prime ministers all across the world. The prime minister from Austria -- "how is Don Keough"? They wouldn't say how's business, how's everything? "How is Don Keough. Please give him my best" -- years after he retired. Still happens today. And we got letters from all kinds of statesmen that are in their 80s, 90s, retired -- "We just heard, our condolences." And it's very unusual. It's the man. It's who he is.

Charlie Rose: What was the relationship he had and the partnership he had with Roberto so that they became, as some have said, a perfect combination?

Warren Buffett: They were a perfect partnership. I've seen probably three or four partnerships in business that really just stand out from all the rest and certainly when Roberto and Don combined their strengths it really was a case of two plus two equaling a lot more than four. They were complementary to each other in an extraordinary way and neither would have achieved the success they did without the other one. But Don was indispensable to Roberto. I watched that for many years. Let me tell you one story that I feel I owe it to Don to tell this because he never talked about it. But we were up in Sun Valley one time, and we were playing a golf match against his son Clark and my son-in-law Allen. And we really wanted to beat these young guys. So we started out a little - we were three down, and I forget whether it was the fifth or sixth hole, but we were three down and it was starting very badly. We got to this par 3 and I said, "Don, the only way we're going to turn the tide is if you knock this in". And he actually hit a hole in one at that point, and totally destroyed these kids. We went on to win the match. Don never told that story but you can confirm it with Clark and Allen.

Charlie Rose: There's also the story that he told me about discovering your investment in Coca-Cola that somehow Roberto may have asked Don, somebody's buying our stock, what's going on? And he said to Roberto, let me make a phone call, I know a guy. And he called you up to say --

Warren Buffett: Yes. Well, we bought about six percent of the company, and I don't like anybody to know when we're buying because it causes the price to go up, so I didn't tell anybody. All of a sudden, the phone rang and I picked up the phone and I can remember his exact words, he said, "Warren, you wouldn't be buying a share or two of Coca-Cola stock, would you?" And the cat was out of the bag.

Charlie Rose: They bought a lot of shares, did they, Muhtar? There's also the sense of understanding the company and its brand. No one was a better communicator of what the brand meant and what it meant to him and which he talked about. He said, "I define my role to protect and enhance the trademark of the company."

Muhtar Kent: He would always say, I have a very simple job. All I do is go in every morning, wherever I go to, working for the Coca-Cola Company and its bottlers, and I polish the brand a little more each day. That's what he would say and that's what he did. And he did it so masterfully. There was nobody living that personified the brand better than Don until he passed away last month. There was just no one that

came close. That's why we -- you know, we named our current leadership academy at the Coca-Cola Company the Donald R. Keough Leadership Academy.

Charlie Rose: Teaching young entrepreneurs what?

Muhtar Kent: Teaching young leaders of the company, young entrepreneurs, young leaders about leadership and how Don -- it was personified in Don.

Charlie Rose: His values.

Muhtar Kent: His values, his wisdom, his wit, his humbleness and his way of clear communication and how he would set priorities. It would just come so naturally to him.

Charlie Rose: One of the things he said, that success made him nervous because it scared him that there would be arrogance and complacency.

Father John Jenkins: That was his theme. And I heard that many, many times from him. Stay nervous, is what he told me frequently, and good advice. Good advice. I mean a brand like Coke, it's easy to ride on that or Notre Dame, but he was always pushing for more.

Timothy Shriver: He brought the same discipline to the issue of the -- you know, I could say not for profit sector. The initial sponsorship, if you will, of the Special Olympics movement in the 70s, he wanted to do something good for people and he thought it was good for the Coca-Cola Company, but he was clever too. He bought 100,000 T-shirts. I think he bought them for about \$1.50 each and that summer every single local Special Olympics event all over the United States, about a thousand or 1,500 T-shirts were distributed and every single volunteer became an ambassador. The brand was all over. I mean you talk about polishing the brand. He polished the brand 100,000 times on a day those T-shirts were shipped. And his message was 100,000 this year, we're going to do more next year. You have to grow this thing. When I went in to see him when I was in my 30s and thinking about my own career, looking to him for advice as so many of us did, his challenge to me was how do you grow this thing? How do you bring it to China and India? How do you make a difference for more children -- talk to the folks down in Atlanta. He always said, don't take too much of their time, he said, just ask them for what you need and then get the hell out of the way. I've tried to follow that advice, not always successfully.

Charlie Rose: Let's talk about new Coke -- he was part of that disaster. He said "We're not as smart to have thought it would be too perfect or too dumb to have not realized the mistake.

Muhtar Kent: Well, I think it's all about also having the courage to do something because rather than just, you know, watch things happen, take destiny into your hands, do something and have the courage. He always used to say where there's no risk, there's no reward. I always repeat that all the time. So, yes, not everything that you do has to work, but making decisions and standing behind those decisions and being willing to admit that something is not working and go and change, have the flexibility, perfect example of that. And the brand and the company got stronger and better as a result of all of that put together. That's why he would say to you, you know, we didn't do it on purpose. We're not as stupid or we're not as clever as all of that seems. And then he was exactly, you know, talking about how he felt.

Charlie Rose: Warren, did he talk to you about that decision at the time? I mean you were on the board, by the way.

Warren Buffett: No, I wasn't on the board at that time.

Charlie Rose: OK.

Warren Buffett: In fact, none of us were there at that time.

Charlie Rose: You don't know anybody who was there.

Warren Buffett: I was out of communication. But the one thing he did tell me. He says -- he was talking to me about it afterwards, and he said, when those letters started arriving at headquarters addressed to "Supreme Idiot" and they brought them in to my desk I started to get the idea we'd lost a little something here.

Charlie Rose: Here's Don talking about that very decision with me at this table. Here it is.

Don Keough: Our U.S. business has had some challenges. A new formulation was built. Roberto had said, from the day we started, he said, let's sit with (INAUDIBLE) everyday -- everything's up for grabs. Don't be afraid to bring anything in. So a group of our technicians and our U.S. management developed what they thought was a formulation that was going to take over the world. Now you know,, we sat there at the corporate headquarters or sort of isolating ourselves a little bit and saying maybe it would go away, but they kept doing more taste tests, which I covered in two or three commandments. They got a lot of outside experts and sooner or later these things tried of take on a life of their own. I don't want to go into it too far. We ultimately bought in to it --

Charlie Rose: You bought into it?

Don Keough: We bought into it.

Charlie Rose: So you recognized the mistake and Coca-Cola did the work OK after that.

Muhtar Kent: I mean where there's no risk there's no reward. And be flexible and be fast. And then, of course, Don the giant of the man had this stature to go on television nationwide, I mean that night.

Don Keough: The simple fact is that all of the time and money and skill poured into consumer research on the new Coca-Cola could not measure or reveal the depth and abiding emotional attachment to original Coca-Cola felt by so many people. They said they wanted the original taste of Coca-Cola back and they wanted it soon.

Muhtar Kent: I was based overseas at that time, but that night, it was first news on all three anchors, and he was there in person and talking about it to consumers. And that's the way to handle something like that. There is no -- the perfect example of how he would go out and handle something like that. You know, not everything has to work. The thing is stand behind your decisions, and know when you've made a mistake and change it.

Charlie Rose: Warren he told me a story about that and he said that some woman called him up and got through to him and said how could you have destroyed Coca-Cola because it meant so much to me. He said "When was the last time you had Coca-Cola?" She said, "20 years." He said but why are you so concerned? She said, because you're destroying my youth. She remembered that Coke meant more to her than just the drink at some time. It was memory.

Warren Buffett: The people own the brand. The people own the brand. And taking it away from them, they found out how important that brand was to people. And just like that woman that hadn't had one in 20 years. But Don was in touch with people. They may have made a mistake there temporarily, but he could feel what people were feeling. He didn't have to put it into words. He just had that ability to just connect with you in all ways. That book he wrote, I don't know whether you're going to get to that.

Charlie Rose: Right now is a good time. Go ahead.

Warren Buffett: Well, we have a group that met every two years since 1968. We call it the Graham Group. Actually, Kaye and Don Graham was in it, Tom Murphy was in it and Bill Gates was in it (INAUDIBLE) -- and all of these people. And Don was in it. And every time we met the group wanted to hear Don speak. So I kind of wanted to rotate things but they didn't want me to rotate things. They wanted to hear Don. So he gave the key points in that as a talk one time and the crowd went wild. So we all suggested to him, you know, you have to put it in a book and he did and the world was better for it.

Charlie Rose: I repeat that now because Herbert Allen and I were talking about that early today. Herbert wanted to be with us. He just got back from Australia. And he said to me, "Don combined the best values of a great teacher and a great listener. He never held a long meeting, always leaving with you wanting more. He had the unusual combination of needing to be needed but never needing to be recognized." I heard the speech at Sun Valley which became the basis for the book and the book was released I think in 2008 and was called the "Ten Commandments for Business Failure". Ten things you can do for business failure and they are: quit taking risks, being flexible, isolate yourself, assume infallibility, play the game close to the foul line, don't take time to think, put all your faith in experts, love your bureaucracy, send mixed messages and be a friend of the future. That summed him up, did it not?

Warren Buffett: 100 percent. That's 100 percent. It was such a great way to present it, too, because everybody's got these ten rules for success, but he got -- I heard it in Sun Valley. I heard it with our group. I mean he just had that way of presenting things that grab you in the first minute and you would just hope he wouldn't stop talking, it was so good.

Charlie Rose: He wrote a letter to you when your mother died.

Timothy Shriver: He did. You know, I think he was of an era, Charlie, where there were sort of great Irish-Americans, if you will -- not just because they were Irish, but because there was a certain sense of faith that underpinned their lives. Don was tough. He was raucous. He was funny. He was wise. He took risks. But he had a deep faith. And I think that's what connected him to my mother. They had this beautiful -- whenever he would see her -- and she wasn't a touchy kind of person -- he would always hold her hand. And I never forget it because no one did that. I mean my father didn't hold her hand. I mean she just wasn't that kind of girl, you know?

Charlie Rose: But Don did.

Timothy Shriver: But Don did.

Charlie Rose: And she liked it.

Timothy Shriver: Don would reach across and he'd hold her hand and look at her in the eye and say, Eunice -- and there was an energetic connection there that I think he knew that she brought something to him that was important to his life, not a great huge university like Notre Dame and a powerful center for hiring education, but these little humble people that she represented also meant something dear to him. And she as their representative they formed a beautiful friendship.

Charlie Rose: Here's what he said about Notre Dame vs. Nebraska when I asked him about the competition between his beloved Notre Dame and Warren's beloved Nebraska. Roll tape. So what happened when they were playing the University of Nebraska?

Don Keough: Well, I have to tell you the truth. I was kind of pulling for Notre Dame.

Charlie Rose: Of course you were. I know.

Don Keough: And you know, Warren is one of the great fans of the University of Nebraska. We've seen a couple of those games together and Nebraska won both of them.

Charlie Rose: So the two of you were there rooting for the opposite teams?

Warren Buffett: Charlie, I have to tell you, Don broadcast Nebraska football at the very beginning of television when there was only one television station in Omaha and they paid \$25,000 for the rights. So he actually broadcast the game. And of course, he had a 15-minute program on the local TV station at the time.

Don Keough: You know each day, as part of WOWTV's late noon hour show, we have 15 minutes where we drink a little coffee and meet a lot of very interesting people.

Warren Buffett: And he was followed by Johnny Carson who was just beginning his career. They lived in the same apartment house. And when I would see Don 30 or 40 years later at a Coke meeting or something he would say, "Warren", he said, "whatever happened to the Carson fellow?"

Charlie Rose: Warren, what were his passions other than Coca-Cola, friendship and Notre Dame?

Warren Buffett: That's pretty good list right there.

Charlie Rose: And Special Olympics, too.

Warren Buffett: Yes. His family and friends I mean. He, for five years after he had oral cancer, he made every single one of Berkshire Hathaway's directors' meetings, and after every one of them where maybe eight or nine managers would present, every one of those managers would get an individualized note that meant something to them. I mean he really was analyzing the business they were in where he might be helpful and these were not form letters. Every single one of them would get a message that meant something to them specifically. And that went on year after year after year after year when he could not eat a meal or anything of the sort. He came and he participated. Just anything he did, he did 100 percent.

Charlie Rose: He was on the board until what?

Muhtar Kent: Until a couple of years ago, and then he retired from the board and stayed on as adviser to the board until he passed away. You know, to Warren's point about the intellect that he put into the letter, I kept every single letter that he has written to me over the last 30 years and there would be one letter that came from him always on St. Patrick's Day. But I obviously received many other letters and I put them all in a file and I kind of opened that file and read through that file, and I had to hold my breath because it is so current, whatever was written 30 years ago, 20 years ago, 15 years ago, has incredible relevance and meaning today. And it's just -- they're just beautiful words put together by a deep, strong intellect and passion.

Charlie Rose: OK. Here's picture with you Muhtar. You and Don meeting the Austrian prime minister, this is 1992. You can see that picture in a moment.

Muhtar Kent: Yes, that was Franz Vranitzky who was the prime minister of Austria for -- chancellor of Austria for ten years from '86 to '96. And there we are opening our office for eastern and central and southern Europe, and Don visited us. You know, I traveled with Don a lot and met with a lot of dignitaries. As I said earlier, it was just a bond, like what Tim said about the bond between Eunice Shriver and himself. There was just a bond. Those big hands would hold and the eyes would lock in and there was

just a deep intellect, humor, wit, understanding, ability to listen to people and contribute. And so whether it's Franz Vranitzky, chancellor of Austria, presidents all around, they would just care about the person and remember, even if it was one meeting.

Charlie Rose: Let me get a final word from each of you, Tim, as we remember and appreciate a friend.

Timothy Shriver: I think the great thing, Charlie, about Don is that, where business is going today, you see brands all over the world trying to find ways to embody big values, to capture the power of delivering the product and delivering the value proposition at the same time, about being that something more, something bigger. Don knew that 40 years ago and he created the world's most powerful brand because he linked it with deep value; because what he brought to individuals, he brought to the company. There will be business leaders for the next 20 or 30 years who would do well to study what Don Keough believed deeply which is the heart and soul of the business is just as important as its operations and its efficiencies.

Charlie Rose: Father Jenkins.

Father John Jenkins: I'd just say -- I'd just build on what Tim said that again, Don, you look for a technique or you look for some trick he did. It was Don. It was who he was, the values he espoused and lived by. The way in which he connected with people as Muhtar was saying said in a deep level. That gave him the power of being a great leader. It wasn't any gimmick. It was Don. That's what he taught me.

Muhtar Kent: He was the most special person that came through my life and I will always remember him and love him for that and for what he did to make everyone he touched a better person.

Charlie Rose: Warren, final word.

Warren Buffett: I'd just say again. Everybody loved him and they were 100 percent right.

Charlie Rose: For all of you who came here this evening to appreciate Don, thank you so much. For all who knew him, all who knew of him and all who wished they had known him, for all those whose lives he touched -- we remember him and our thoughts and sympathy are with his wife Mickey; his daughters Kathleen Soto, Shayla Rumely and Eileen Millard; his sons Michael and Patrick and Clark, 18 grandchildren and two great grandchildren, a remarkable man who understood the power of friendship. We remember Don Keough tonight.

The Giving Pledge (2015)

7/17/2015

Charlie Rose: 15 years ago, in the year 2000, Bill and Melinda Gates created the Bill and Melinda Gates Foundation. 9 years ago, in 2006, Warren Buffet pledged part of his fortune to the Bill and Melinda Gates Foundation. The Gates Foundation has since become a leader in fighting global issues such as hunger, poverty, infectious diseases, and education. In 2010, Warren Buffet, Bill Gates, and Melinda Gates joined forces one more time. They created the Giving Pledge. It is a request for the very wealthy to pledge to give away at least 50% of their wealth to charitable causes before they die. That effort has grown to include 137 contributors from 14 countries. Last week in Sun Valley, Idaho, I talked to Warren and Bill and Melinda about their lives and how the Giving Pledge came about.

Bill Gates: Well, it really grew out of Warren's idea that we should meet with other people who'd been serious about philanthropy and learn from them. Why were they engaged? How were they thinking about it? Through those dinners, the idea that we'd actually create a group emerged and it's really been amazing to us. We have a yearly gathering. People who have common interests will meet separately. I've learned a lot. I look forward to those gatherings. It's not people pitching each other, but there's so much in common that we can learn and sometimes people do end up working together.

Charlie Rose: We'll come back to what you've learned. Where did the idea come from and what were you thinking about it?

Warren Buffet: I'm not exactly really sure where it came from. Like Bill says, we had a dinner that David Rockefeller hosted and I would say it sort of evolved out of that. We had 15 or so people there, counting couples as two, and we went around the table and we just asked people to sort of explain where their giving philosophy came from. Not to make a pitch to anybody. How their thinking went. They talked about their families and they talked about their parents' influence and it took at least 2 hours to get around the table. People were really interested in talking sort of peer to peer about it. There was so much. We clearly hit a chord someplace. Then the three of us talked later on, and the Giving Pledge evolved out of that.

Charlie Rose: I remember you talking to me about it at the time. You said you were surprised, there was an emotional connection between people because they thought and they found themselves listening to other people and feeling like, This is exactly the way I feel.

Warren Buffet: Yeah, they didn't feel awkward in talking about themselves. I think we're a little lucky, perhaps, in who we called on first, even. The first couple, their degree of candor, I think, was contagious as we went around the table. Nobody engaged in any posturing or anything of the sort, which you might get sometimes in a group, particularly where some of the people don't know each other well, they're acquainted. Instead of that, we got this very candid discussion by really everyone there. They talked about their children sometimes, and sometimes their disappointments, or sometimes how they felt good about what happened with them. It became clear that if a bunch of people somewhat similarly situated would get together, we'd learn from each other and perhaps have a lot of other good things come out of it. So it just sort of evolved out of that first dinner, I would say.

Charlie Rose: Melinda, how's it growing?

Melinda Gates: It's been growing substantially. We have 137 pledgers now, in 14 countries. I think one of the neatest things now is when we get together for these annual gatherings and the first night that you sit down at dinner, you realize you're amongst friends. That all these people we've met over time, not only

[More Compilations](#)

are we getting to know them but they're getting to know each other. They look forward to the event, I think because of the candor of the conversations we can have about, "What do you do about your children? What about the next generation? How do you think about a leader? How do you even start a foundation if you're just beginning?" Those are the conversations you want to have in private in a small group and I think that's what our gathering affords.

Warren Buffet: There's no one-upmanship or anything like that. Some of these people are quite capable of that in different situations. I would say it brings out the best in everybody. They're not trying to impress the other person or anything. They're genuinely interested in successes, failures, family situations, whatever it may be. There's a level of candor that's really impressive.

Charlie Rose: You now have an international dimension. Was that bridge hard, to get people who were not as familiar with philanthropy as Americans are?

Bill Gates: One of the things the U.S. should be proud of is that it is the leader, the most engaged to philanthropy and most of the really strong historical examples, Rockefeller, Carnegie, Ford Foundation, were American foundations. Other countries are interested in it because, whether it's helping universities or research or trying out new ways of doing education, philanthropy has proven, even though it's a small part even of the U.S. economy, it's been a very innovative part where people show new pilot programs that then really influence a lot of other activity. Most of our members are from the United States. We've done a slightly better job of reaching out to people in the United States, but the international pieces is going to grow. We'd like to see philanthropy strengthen on a global basis. We always like to see people getting involved when they're younger, a bit more collaboratively, and hopefully with even more of their resources.

Charlie Rose: That's one of the tenets. Trying to tell people to think about this early in your life rather than think about it at the end of your life, because you're better equipped to make decisions at this time.

Melinda Gates: Definitely. I think by having people come together once they've decided that they're going to pledge, even if they're pledging to give it away at the end of their life, if they come to a gathering they start to learn from one another about what's even possible in maybe the field they're interested in, "How did you get going?" Yeah, we're trying to get people to learn from one another and hopefully to get started a bit earlier, because if they put their brains against these problems, whatever they've done in their business life against the problems of inequity of whatever they choose, they can have a huge effect. They're learning that from one another.

Charlie Rose: What's the pitch to somebody?

Melinda Gates: He's the best at it.

Charlie Rose: I know, that's why I directed at him.

Warren Buffet: Oh, I'm not!

Charlie Rose: You call them up and you say what?

Warren Buffet: I usually send them some material on it first, because there might be some misconceptions about it. I ask them whether they've gotten the material, if they've got any questions.

Charlie Rose: "Have you read it?"

Warren Buffet: Yeah. What you want to do is get them talking. There are some people that aren't interested, but a very significant percentage are. I've been amazed at, frankly, how well it's gone. I would have said if we 50 by now, I would-

Charlie Rose: And now we have 130.

Melinda Gates: 137.

Warren Buffet: 137, yeah. I had the dinner here some months ago and one of the people that came had misconceptions about, they had to do this or that. By the end of the evening, this particular person was ready to join and will give 99% in this particular case.

Charlie Rose: What's the transaction?

Warren Buffet: The transaction is simply that they write a letter making a pledge to give at least 50%, although a lot of them name a larger number, but give at least 50% during their lifetime or at death to philanthropy. I encourage them to explain how they got to that decision. Is it from their parents, from the examples around them, and why they're doing it. We get some magnificent letters. I tell the people I talk to that the letters are enormously important because somebody 10, 20, 50 years from now is going to read that like maybe Bill or Melinda or I have read about Carnegie or Rockefeller or Rosenwald or you name it, and you never know what's going to strike a chord. It's like a lawyer making an argument, you try to name 20 reasons why your client isn't guilty, you know, it may only 1 or 2 if you're really that good!

Charlie Rose: You want to make sure you got the one covered that people might respond to.

Warren Buffet: All you got to do is hit a chord on one of them.

Charlie Rose: Do you all make the calls? I mean, the three of you are engaged in a real personal way, in terms of recruiting. Or is there a system?

Bill Gates: The thing that has worked the best is to just to invite people to a dinner that's about philanthropy. That's not a recruiting dinner. When I'm traveling around, I always look at my schedule. Do I have time for a dinner? Even outside the U.S.. You have anywhere from 6 to as many as 15, which is almost too many, and you talk about philanthropy. Afterwards, if you get a sense that it might be a fit for them, I can follow up by sending the material and making a call. A lot of the people who are joining already have the intention to give every dollar, but they do find the idea of being part of the group, that it'll help them engage and make sure that it's a fun thing for them. We love the impact and diversity of philanthropy, but we also feel like people, it's a voluntary thing. It can be one of the most fun things you've ever done, and yet hiring staff or picking exactly what cause, or it forces you to think about death and how your kids may be involved, some in different ways than others. These are complex issues and even somebody who's successful at business, it doesn't necessarily prepare you for answering these questions.

Melinda Gates: Sometimes they have to have a family conversion. They'll say, "We're in favor of it in general. We kind of had an initial conversation over the years with our kids but we've never committed like this, so give us some time." And then they'll say, "We'll call you back in 3 months or 4 months," and we do. The neat thing is if they'll share with you sometimes the conversations they had with their kids, because they're so proud of how their kids responded.

Warren Buffet: I know one case where the kids actually talked one of the parents into doing it. When that parent was initially not inclined to do it.

Charlie Rose: What are the resistances to doing it?

Warren Buffet: They don't want to. They don't want to give away the money. When I call them and they say, "I'm actually planning to have all my money put in my coffin with me," I do not have much of a chance. I tell them there's no force for it under the graveyard.

Charlie Rose: How about people who say, "I want to pass it to my family? That's what I want to do."

Warren Buffet: That's what they want to do, that's their business.

Melinda Gates: That's their business. Definitely.

Bill Gates: If they want to pass it all, they're not a fit for the group. We particularly see that if the bulk of it was passed down to them, because then it's like breaking a machine.

Charlie Rose: Ah, inherited wealth is more likely to be-

Bill Gates: Why should they break the chain? First generation fortunes tend to be more philanthropic than inherited fortunes.

Charlie Rose: The interesting thing, you have young members, too.

Warren Buffet: That's huge.

Melinda Gates: 31 years old, yeah.

Warren Buffet: That's huge. 20 years from now, there's going to be dozens and dozens and dozens of billionaires. Hundreds that have come up whose heroes are the Steve Jobs or the Mark Zuckerbergs or you name it.

Melinda Gates: I'm really particularly excited to see what Mark and Priscilla do. They're already learning a lot about philanthropy. Mark Zuckerberg and his wife Priscilla Chan, how they will come at it, because she's so embedded in health and he's so embedded in education and Facebook, and yet the way they see things together? I think they will totally inspire a group of people.

Warren Buffet: We're having a session for the younger members of the family of people who've signed up here in a short period. I think 35, I know 35 are coming, probably more will come. Their attitude towards life. Some of them are maybe beneficiaries of trusts their grandfather's signed up for or something, but it's the influence on future giving that I think will be very, very substantial. I think it's having an effect currently, but it'll be bigger over the years.

Melinda Gates: That's a group we call the next generation group. They're getting together on their own. I think their next meeting is actually in Omaha, right?

Warren Buffet: Yeah, right.

Charlie Rose: What do you learn at these sessions?

Bill Gates: We have people get up for an almost Ted-like thing and give a 6 minute explanation of something they're excited about or something that's gone well or something that didn't go well so they think they're smart-

Charlie Rose: A sharing of experiences.

Bill Gates: Then we'll have breakouts. Things like, "Can you do investments that advance your philanthropic things?" We have giving international, we have scientific research, education. We had four breakouts this time and people's main complaint was that they had to pick one of the four because they saw several that they were interested in.

Charlie Rose: I should make this before we start talking about the foundation in general, there is no legal commitment made.

Melinda Gates: That's right.

Charlie Rose: There is an ethical, moral commitment.

Warren Buffet: That's right.

Charlie Rose: But that's it.

Warren Buffet: Yup.

Charlie Rose: When you set up the foundation, the two of you, what was the idea?

Bill Gates: We talked about it even before we got married. That was about 6 years into our marriage, I was seeing that I could spend a little more time on it. I had turned the CEO title over just that year. We made a pretty big set of gifts \$20 billion that particular year. That kind of forced you to get going. Fortunately, my dad and I--

Warren Buffet: That's a start.

Charlie Rose: It's even a big number to you. It is.

Bill Gates: It's a minimum pay off, 5%.

Warren Buffet: I didn't know there were that many Euros.

Bill Gates: Both my dad and a great person who had been a Microsoft executive, Patty Stonesifer partnered to create the organization, even though between children and work we weren't able to give as much time as we have now. We got started. We can look back on that now and say that was the start of a learning curve. We did a lot of reproductive health. We learned about that. We thought, "Okay, let's do some science." We weren't working with governments as much. We've learned that's super important. It was great that by the time we both got more time, the foundation was already going. It had a core team of people. A bit of expertise. Made some mistakes. Done some things well. By 2008, when we're both increasingly engaged, there's a lot there to build on.

Charlie Rose: What were the principles that you began with?

Melinda Gates: That all lives, all lives have equal value, no matter where they're lived on the planet. And yet, as Bill and I would travel and read and look out, you'd realize we don't treat all lives as if they're equal. What we spend, for instance, the United States to save one adult or one child from death, it takes \$30 to save a child's life with basic packets of vaccines in developing worlds, and yet we weren't doing that. We weren't making those investments as a world. We said to ourselves there has to be something we can do about it. We decided to invest in health outside of the United States. We thought that's where we could have the most impact. In the United States, we felt like not all kids were having an equal chance at a great education. Our predominant investments in the United States have been around the US education system.

Charlie Rose: Has that changed, in terms of where you see the focus for this foundation?

Bill Gates: Those 2 big themes will be our focus for our entire lives. Those are big enough problems that if you went to relieve polio, which looks good, we'll move onto malaria. There's enough diseases for our lifetime. We'd love if the foundation in our lifetime really could conquer a lot of that, and so people then later could focus on other problems. Education has been I'd say the one where we've seen less progress, but we're still totally committed to it. It's the right cause. The United States created this amazing framework that allowed Microsoft and Berkshire and amazing educations that we were both had the opportunity to have. We wish we could have the same type of impact in US education as we feel quite sure we'll have on global health.

Melinda Gates: I think the other thing to say is that--

Charlie Rose: You wish, but you're not sure you'll be able to achieve that?

Bill Gates: No, we're not sure. It's the -- Of all the things we're doing, it is the riskiest. We spend on education broadly about \$800 million a year. That money has not in some dramatic way, neither our money nor the other philanthropists, and there's some great partners in this. Michael Bloomberg, Eli G rode, a ton of people who do amazing work.

Charlie Rose: On education?

Bill Gates: Focused on charter school. Yeah, on US education. As a group we can 't say that the educational scores have moved up a lot. Dropout rates have come down some. There's a few points of light in terms of some good charter schools.

Charlie Rose: Warren, you're watching this from a place of friendship as they did this. You obviously, I think it got accelerated after Susie's death, began to say what should I do. Did you have evolving thoughts about philanthropy?

Warren Buffet: No. I thought fairly vast about what I wanted to do. I don't go into a trance over the sale. I had a well thought out report in terms of before Susie died. Then, I had to make a change. It was obvious what I should do actually.

Charlie Rose: Obvious that you should give your money away? Or obvious that you knew where to give it?

Warren Buffet: I was going to give it away under any circumstances. There really isn't any other option Charlie.

Charlie Rose: You can't take it with you.

Warren Buffet: Out of everything in life, I wanted the money would buy. I mean, gone long ago. Money had utility to other people, it had no utility to me. Then, the fact -- The approach that all lives are of equal value. That -- I wouldn't change a word of that. I mean, that is exactly how I feel. Then, the question is is what's the best way to translate a bunch of little paper stock certificates into something that is consistent with the belief that all lives have equal value? Here I had the perfect situation, in that an entity was already in existence. It was run by 2 extremely bright, energetic people who were going to devote their lives to it. Young by my standards anyway. Spending their own money, which is a real factor. It wasn't play money. It was very natural. Of course, I did it in conjunction with 4 other foundations too that were smaller. They weren't in scale the same way.

Charlie Rose: Of your foundations?

Warren Buffet: Yeah. All five -- I mean, I couldn't feel better about it.

Charlie Rose: What was your response?

Melinda Gates: Tears.

Bill Gates: Tears.

Melinda Gates: Both of us, yeah. We took a walk, and we were both in shock.

Charlie Rose: You and Bill took a walk? Who was on the walk?

Melinda Gates: The two of us.

Bill Gates: We just walked and said wow.

Melinda Gates: Unbelievable.

Bill Gates: Wow. What a sense of responsibility. We benefited so much from our friendship with Warren, even independent of this. The whole idea of giving it away, I read the fortune article, it was about giving it away, even before we met Warren. That had greatly influenced my thinking. Then, as we've been going about the foundation, I've been talking to Warren one on one and he had a group of friends together. When within a few months of us being really inspired about okay global health. We can have so much impact. I was just electrified to share my enthusiasm in front of Warren and a group of his friends early in the life of the foundation. He was an advisor. A helper. A mentor. Every step of the way. The idea that wow, we were going to be able to magnify this and our sense of responsibility back to him would be even greater than it had been. It was very touching.

Charlie Rose: What role do you have?

Warren Buffet: Just a couple days every July I make a -- 5% of a number. It's still -- I may be poor, but it still well within my capabilities to do that. That's about the limits.

Charlie Rose: It's not a small number is it?

Bill Gates: He gives 1% to the 5 foundations. I think 2.48--

Warren Buffet: 2.8 billion

Bill Gates: 2.8 billion worth of Berkshire stock. In shares of Berkshire stock. He's named an amount which -- Then, he takes 5% of that, of the remainder every year. Berkshire stock has gone up enough even though the number of shares goes down, this is a record gift. Really incredible. All 5 foundations got this amazing check. I hope we sent a thank you note. I'll have to check on that.

Warren Buffet: The thank you note is what they do. Thank you is what they do.

Charlie Rose: What is it that brings you the most satisfaction from being engaged with them in this work?

Warren Buffet: It's the satisfaction of knowing what I built up over a lot of years is going to get used to improve other people's lives.

Charlie Rose: Have the ambitions of the foundation changed? Because clearly I have read the annual report. Read his annual report and now read your report. Clearly, you have talked about things, about

measurement. You've talked about the importance of government, in terms of partnerships. How has it evolved in terms of the ideas that permeate the work of you 3?

Bill Gates: Well, we're on a learning curve. From the year 2000 to the year 2015, the cause of global health had some great achievements. Some governments, and we came together for a vaccine fund Gobi. Likewise, a similar set of partners for the global fund, which was about HIV, tuberculosis, and malaria. Those funds were established and set very ambitious goals. They ran into some corruption and the prices didn't go down as much as they wanted. Some countries weren't getting the stuff out as much as they wanted. How did you build the management of those organizations? Overall, they were phenomenally successful. We probably put that at the top of the list of things that we really can point to that we, with partners, feel incredibly proud of. I can rank, of all the years we work, those would be at the front. The education stuff, although we remain committed, we haven't moved the dial on the average math capability, or reading and writing capability of particularly the inner city schools. But we have enough successes to really be energized and really get a pattern of okay, how do you work in very poor countries? How do you engage the best scientists in the world to come up with new tools? I'm more enthused about the work today, than even the very beginning.

Charlie Rose: And so are you?

Melinda Gates: Absolutely. I think one of the things, one of the premises we have about how we work has to do with innovation. That we believe in innovations. Whether it's an innovation in a vaccine. A malaria vaccine. Or an innovation that comes along technologically. Those innovations allow us to push forward on behalf of the poor. Great example is polio eradication. We couldn't really be talking about polio eradication if we didn't have the right vaccines, the right tools, but also the mapping that's come along is what's allowed us to get down to the village level to know if we're making progress. We believe in innovations. Making sure those come out of the labs from all over the world. China, India, the United States, UK. Get them out on behalf of the poor, but then it's up to governments to scale up. Even though we've put in billions of dollars into vaccines, they're tens of billions put in by governments to scale it up so we can have--

Charlie Rose: So you're saying you do some of the groundbreaking work in the beginning? Almost pilot projects that give people in government who have the ability to scale up, to scale up?

Melinda Gates: Every single thing we're in requires government scale up. Whether it's reducing tobacco usage. Whether it's eliminating malaria. Whether it's US education system. We could spend down our resources on the US education system in less than a year if we were just putting all of our resources into US education.

Warren Buffet: But that's one extra value they bring. Both Bill and Melinda have the ability to bring others along with them. Both governments and individuals. There's not only the funds of the 3 of us combined, but they have the stature, the eloquence, the experience, to talk with maybe governments. Maybe very wealthy individuals, and corral hundreds of millions, maybe billions of dollars additionally on this. There's a multiplier effect.

Charlie Rose: You would know better about this, and probably better to speak about it than they are. Their participation on the ground makes a difference. To see them in a village in India--

Warren Buffet: Yeah. It's unmatched. I mean, Rockefeller and Carnegie and Roosevelt, they did wonderful things. They spent a certain amount of time, but they did not -- They were not working 50 and 60 hour weeks all over the globe and going to some very -- Places I don't want to go to.

Charlie Rose: No.

Warren Buffet: It's hands on to an extraordinary degree. That not only gets results, but it attracts other people to go along with them because they know it's for real. It's big.

Charlie Rose: But you don't do it because you know it'll make a difference. You do it because you want to be there. You want to see it with your own eyes and feel it with your own hands.

Melinda Gates: You have to.

Bill Gates: Yeah. Trips -- There's a mix of things. Some trips are purely learning trips where you don't go and see the government. You don't go and see the press. You just go out and see okay, what's up with malaria? What's up with farming? We didn't grow up knowing much about even virtual farming. Poor old farming is quite unique. Then, there's the trips where you really are sitting down with the president saying your vaccination rate compared to other countries is far lower. The way you get the vaccines out, you can do a lot better.

Charlie Rose: Yeah, and we're here to help.

Bill Gates: Yeah. We'll put money behind it as a measurement system so you will know what parts of your country or what parts of the ministry are really doing the job well. Let's get engaged in this. The willingness of those leaders to sit down with us and talk about these things has been a positive surprise for us. There's a number of countries, Ethiopia would be the top of the list where they really changed a lot of policies. Although it took some of our resources, they made permanent changes to the health and agricultural sectors.

Charlie Rose: What kind of resources, what kind of people, what kind of institution are you creating?

Melinda Gates: We work with so many partners.

Charlie Rose: Are these all come together for the foundation or are they sort of on hoc basis?

Melinda Gates: Well it depends on what you're working on. We have different gatherings and different settings, so for instance in polio is a great example. We have Unicef, Gavi, World Health Organization all working together on polio. On the ground you have different partners with different expertise and then back in the UK or back in the US you may be using a partner who's using the mapping and the modeling and the disease surveillance. Some of it happens on the ground and some it happens back home.

Charlie Rose: The foundation is coordinating all of this?

Bill Gates: We have about 1,500 people in total. Most in Seattle, with offices in Africa and India and China. Also an office in Europe. We use grantees as much as we can but in a field like malaria, we have a group of around twenty people who are experts. They can go out to the vaccine experts, the drug experts, the mosquito experts, the modeling experts and orchestrate those skillsets together. Then take that and say okay, which countries are we going to get rid of malaria in and how are we going to reduce that map. In many cases, we are helping to convene different silos of expertise with people at the foundation.

Charlie Rose: Talk about expectations. Polio, 2020, eradicated?

Bill Gates: The best case, which is actually a possible case, I'm so close to it-

Warren Buffett: Don't make stock market predictions--

Bill Gates: I'm so close to saying I can have a positive bias.

Charlie Rose: So close to polio eradication?

Bill Gates: It's gone very well the last year. We haven't had a case in Africa since last August.

Charlie Rose: For almost a year, not one single case of Polio in Africa.

Bill Gates: Polio in Africa.

Melinda Gates: In the whole continent.

Bill Gates: The only two countries that we've had wild polio cases are Pakistan and Afghanistan and even there, the two regimens including the army people there and the various political parties there is a step forward to improve the quality of the campaigns. We are now reaching almost enough children that we feel there's a good chance of the last polio case being in Pakistan sometime in 2016, which they you would start a three year clock to make sure that you're looking and there's not some hidden pocket of the disease, which is a very appropriate time period. Then that would lead to a certification. The best case by 2019. That's so exciting.

Charlie Rose: You're living this aren't you.

Bill Gates: It's so exciting because it has been hard. It's been delayed from what's expected when the whole thing got started but a lot of brilliant ideas came along in the process, and those ideas will apply to improving world health and going after other disease eradications once we're successful on this one.

Charlie Rose: When was the last time humanity eradicated a disease?

Bill Gates: Only one disease has ever been eradicated and that was smallpox.

Charlie Rose: Smallpox.

Bill Gates: Last case was '77 and the certification was in 1980.

Warren Buffett: Think how important that was.

Charlie Rose: Absolutely.

Bill Gates: It killed millions a year and the US took the lead and we did it. They didn't even have internet and modeling now. They had some amazing people but that was inspirational.

Melinda Gates: I think that-

Warren Buffett: Go ahead.

Melinda Gates: I was going to say that I think the other thing besides the modeling now is is this expectation, you asked earlier about ambitions of the foundation. It's not necessarily ambitions, it's expectations. When Bill and I came into philanthropy, one of the things that was shocking to us, when we were at Microsoft both of us, you could get a report on your desk about sales any day of the week. You clicked on it, right? You couldn't get it. If you're trying to eliminate malaria in certain countries or eradicate polio, those datashystems didn't exist. Now, every thirty days we get a report on polio that says exactly which villages it's in in Pakistan, Afghanistan and Nigeria up until last year.

Charlie Rose: One more example of significance of data in the data revolution

Melinda Gates: You have to have to have data. It allows you to know you're making progress, but it's also starting to allow us as a world to know how and where to act on some of these problems at a much deeper level.

Charlie Rose: If you can eradicate polio, you want to give an inspiration to people that it is possible to do these things-

Melinda Gates: Definitely.

Charlie Rose: If you bring enough resources, will-

Melinda Gates: Focus, talent.

Charlie Rose: Focus and talent.

Bill Gates: After smallpox got done, the head of Unicef, Jim Grant, a brilliant person who's responsible for saving tens of millions of lives said, "Okay, our next phase is going to raise vaccination coverage from 30% to 80%." He took the 1980's and '90s and got us very close to that percentage. That's another miracle. Really, the second other big miracle other than small pox in global health up to this point. It was all driven off of the kind of confidence and energy and resources that came because smallpox worked.

Charlie Rose: Warren, you've got to look at this and say, "My God, I couldn't be spending my money any better."

Warren Buffett: No, exactly. It's gratifying because to be able to translate an accumulation of wealth, it basically has no meaning in terms of your life unless it gets translated into something that really does save lives. One thing that is worth emphasizing is when you get into large scale philanthropy like this, take the eradication of polio, it's not a cinch. In the field of philanthropy, big scale philanthropy, it's not the batting average that counts, it's the slugging percentage. It measures. If you do nothing in life but bunt and get singles, that's fine, you'll have a high batting average. The best slugging percentages-

Charlie Rose: I've got you.

Warren Buffett: A big foundation should be shooting for a high slugging percentage, not a high batting average.

Melinda Gates: That is so reassuring. That, what Warren said to us and the other foundations that he put his money into is swing for the fences. You've got to take risk. Particularly, we're working on problems that society has left behind. That rings in your ears when you're doing really hard days. There are hard days where you feel like you're not making progress or you feel like, "What haven't we seen, how did we not go about this right?" We have to remember that it's these hard problems. That keeps you going. That and meeting the people in the field, the amazing partners that we work with but also the families who are lifting themselves up under unbelievable circumstances.

Charlie Rose: A couple quick things too. One, malaria, you're hopeful that by 2050, perhaps? If lots of things come together?

Bill Gates: We've got to be able to do better than that. We're in this period where we need some new tools. In the drug pipeline, the vaccine pipeline, the killing mosquitoes pipeline, there's some really good stuff. We expect that sometime between 2030 and 2050, it can be eradicated. The actionable thing at this point is to take that map of where malaria is and pick a few areas and do regional eliminations. Southeast Asia, Cambodia, Thailand, Myanmar, there's quite a bit of malaria there. That's one of the first regions

that we've gotten all those governments together. Australia is helping. US, UK. We're going to prove that even with today's tools, we can do it there. We have about four or five shrinkages before we'll have the confidence and all the experts will align and say, "Okay, let's go after it in the heart of Africa." That will be the last place. Nigeria, Tanzania, Democratic Republic of Congo. Equatorial Africa is the toughest. We're going to corner malaria there and learn as we go and then have that final push.

Charlie Rose: Childhood fatalities. Nothing could more important.

Melinda Gates: Nothing could be more important. The thing that is amazing about it is the world has made huge progress. Childhood deaths have been cut in half since 1990. Cut in half. Part of that is because the UN with the millennium development goals set a road map that said, "We have a goal of cutting childhood mortality by two thirds." Now, we got it by half, but what happened was all of the NGOs and the partners and the governments, we started saying, "What investments do we need to make? What investments in vaccines? What investments in malaria? How do we get malaria bed nets out and get them used? What do we need to do about women's education, because a child is 50% less likely to die if his or her mother is educated." Every change she then makes in terms of accessing the healthcare system or what she invests in her own child. The world started to make those investments, and now we actually have a roadmap for what works, it's just a matter of scaling those things up more and more and more. Some are innovations like vaccines. Some are very basic things like breastfeeding and keeping your baby warm and clean cord card. Things we do in the United States you can do very inexpensively and it's just cultural change for women.

Charlie Rose: Malnutrition.

Melinda Gates: That attributes to almost half the deaths. I think the saddest thing about malnutrition is that if a child isn't fed properly in what we call the first thousand days, while the mother is pregnant and then after birth for those first two years, they are not cognitively able to learn in school the way that they were meant to learn.

Bill Gates: For every child who dies, there's four children who don't develop physically or mentally. It's only in the last three or four years that the incredible problem that is has become evident to us. Even today, understanding exactly which interventions saw malnutrition, we're doing a lot of pilot studies. It looks like helping the women have chickens in an area so they'll be more eggs or getting cows so there'll be more milk, that is going to be an element of the strategy. That's a nice one because it advances the economic well-being of the livestock owners as well as the nutrition of the community that they're in. There's a lot that we are just learning and we're trying to put some of the micro nutrients into the salt and why hasn't that worked in the past and you need to cook with it. I will be smarter about malnutrition when you see me a year from now, two years from now, five years from now.

Melinda Gates: The last two weeks our son, who's sixteen, and I stayed in Malawian household. This couple was amazing to let us live with them for a couple of days. They just knew we were friends of the NGO that was there and we wanted to learn. It was amazing to see because they were diversifying their diet. They have learned that they needed to eat something more than maize. They'd taken their little bit of money and invested in their chickens. That was allowing not only protein for the family but they were selling chickens on the market, selling eggs to the their neighbors and getting a little more income. Then, they were starting to diversify into pigs, and had by this point three small pigs. I said, "What are you going to do with the pigs?" I thought maybe they were going to eat them. They said, "Oh, no, that's a high school education right there for our daughter. That's part of the school fees, and that one? That's part of the school fees for our son." When they can start to make those diversification it not only helps nutrition but it helps their livelihood which then helps their family. There's not a family I have not met around the

globe where when you ask them what their hopes and dreams are, they say, "I want to educate my children."

Charlie Rose: They believe that is the ticket for them.

Melinda Gates: They know it's the ticket. They don't believe it, they know it.

Charlie Rose: You watch this, you must be on a learning curve yourself. To understand how much there needs to be done in the world, but how there are these solutions and these ideas that are coming out of this.

Warren Buffett: I've always been a great one for letting other people do the work, Charlie. What you've just gotten through hearing. The difference between having two very small people working partly with our own funds committed who care obviously about it. Compared to running some organization where it got set up twenty years earlier and is just gets handed to one person to the next. It's night and day. This is the way to make a difference.

Charlie Rose: Do you think you're having an influence in terms of other people who want to engage in philanthropy exactly the way you have engaged in philanthropy? You made a dramatic shift in your life. You lead the way, then you joined full time. This has been, the way you spend twenty four hours now is very different from the way you spent twenty four hours in 1995.

Bill Gates: Absolutely. The goals are very different. Some of the ideas, the meeting with scientists-

Charlie Rose: The process of acquiring information.

Bill Gates: I was well trained. The Microsoft work was like an idea preparation. I say if we can share two things, one, that philanthropy can be fun and be living examples of that, and on some of the riskier causes that we can get people to feel like, okay, it's a little bit less risky. Maybe they'll do it in a different country or different way.

Charlie Rose: What does risk mean?

Bill Gates: Risk? Taking philanthropic money and spending it in Africa is very daunting.

Charlie Rose: Because it may not be successful or daunting because-

Bill Gates: The idea of, okay, don't these governments always take this and it's corrupt or even if they make progress then there'll be instability and whatever you've done will be wiped out. Could I look foolish, where do I start in Africa? Who do I trust? It took us many years and mistakes before we felt any confidence there. I think everyone in philanthropy kind of encourages other people to take a bit more risk, try something a bit more on the frontier. There are some great causes and Endowing universities. That's a fantastic thing, the scientists there do very good work.

Charlie Rose: Let me talk a bit about women and development. That's become a focus of yours.

Melinda Gates: Definitely. The reason for that is because women are agents of change. I think for too long the community looked at them as somebody we should do something to instead of saying, "They are the agents of change and if you unlock their potential, that is, if you make sure they're healthy and their children are healthy, and you make sure they can have some decision making capability in economic opportunity and you invest in them, they invest in everybody else." Every marginal dollar a woman in a developing world gets in her hands she puts 90% back into her family. She's often the one who is making the decision about what the kids eat, who gets to go to the healthcare clinic when they're sick, who eats

first in the family. We have to invest in them if we want to get huge wide scale impact. I think we weren't as a community really looking at investing in women at scale which we need to do and are starting to do. Secondly, how do you look at your programming? You can't just assume if you do something you create a new seed. We have now a drought resistant maize which is great, a corn seed. If we assume that the agriculture dealers in Africa would get it out to all the farmers, that's a false assumption. They don't reach women. You have to go the extra mile and actually reach the women and make sure they get the crop, they get the seed in their hand, they understand the planting technique, and they can keep the income.

Charlie Rose: This must resonate with you a lot.

Warren Buffett: If you believe every life has equal value, you've got to be doing something for women. The truth is, in many cultures and in our own, and going back for thousands of years in many cases, it has not been the case that society has said that women's lives have equal value to those of males. Our own constitution, when it talks about the qualifications for presidency, it has a whole bunch of male pronouns in there. We wrong that thirteen years or so after say, men are all created equal, but just read article two section one.

Melinda Gates: The thing is, we can measure it. That's the other thing. I think, in the past, it's funny, so much of this has to be and it should be about data so we know where to invest. First of all, we didn't collect the data about women. When we did household surveys, literally, the household surveys in the Bangladesh and Africa and India, the only question they ask is who is the main bread winner in the family. As soon as they learn that, and it's the man, they go down that path. They don't even ask about secondary income. There are so many places where we haven't had good data about women, we haven't collected it, but it turns out when you start to collect it, you can actually measure empowerment. You can actually measure when a woman starts acting differently, making different decisions. When she gets that economic need. We're going to do that, because that's when you get prime ministers and presidents to act differently even in their own countries and make investments.

Charlie Rose: There's this thing you have called 'no ceiling report'. What is that?

Melinda Gates: We partnered in 2013 with the Clinton Foundation to really figure out where as a world do we have data on women. We use the Economist economic unit and UCLA to partner and collect all the data we have around the world in every country we have about women. Childhood marriage, where they were in the work force, labor force participation, do they have the chance to go to school? We looked at that and we also visualized it so that people could go up and read it and now we're going to fill in the gaps where we don't have the right data. The childhood marriage data that we all use and we all quote around the world, it's not very deep. It's really not. If you want to know how to act in childhood marriage, we need a lot better data to know how and where to act.

Charlie Rose: How does technology affect all of this? For better or worse?

Bill Gates: Technology is very helpful. If you're not careful, technology responds to the large markets. The middle income and rich people will drive what applications get written, how it gets used. Piggy backing on the amazing cellphone, the amazing internet connectivity and saying, okay, what about a farmer who wants to learn when to plant their crop, what seeds to pick. What about a primary healthcare clinic and making sure the supply chain really gets everything there. We know is that worker there and are they doing what they should do. We can take that digital foundation and with a little bit of extra money make sure that financial services, health, quality tracking, even budget tracking, although we haven't done this yet we're in the early stage of brainstorming it, how can you follow money and gather evidence of when the money is used appropriately so that donors have more confidence so the

auditing is really built in a low cost way. That digital platform allows us to be way more ambitious, starting with satellite photography that's told us the population for these polio activities all the way down to reaching somebody so that their savings account is literally on their cell phone.

Melinda Gates: When you go in the developing world today, cell phones are pervasive. I don't care what rural village you're in, there are cell phones. They're the old plastic ones we used to use. What that's allowing is those digital platforms as Bill says, mobile money. In Kenya, 87% of the GDP runs through a mobile payment system today. Phones.

Charlie Rose: In Kenya, 87%?

Melinda Gates: 87% GDP-

Bill Gates: They're the leaders.

Melinda Gates: Runs through. But we've got them in the Philippines, Bangladesh, Tanzania. These are happening at scale. A remote woman of a remote area, if her husband goes into Nairobi let's say to get a job, he can send digital money back to her on her phone. Meanwhile, she can be saving a dollar a day from the eggs she's selling at market. When it comes time for the school fees, they've got the money. Not only that, as the cell phones get better, which we're putting, agricultural crop prices at market. When she gives her crop to a middleman, she now knows what the market price is, so when he comes back and says, "I only got \$10 a bushel", she says, "Well the market price was \$20." What that's going to happen when those start to become smart phones, women will tell you all over Southeast Asia, we know that one in three women experience violence around the world. There's no an application that I can give six people on my smart phone network my cell phone number. If a woman gets in a violent situation in India, she can press one button and six people immediately know she's in trouble. Eventually, we'll know her GPS location. That changes things for women.

Warren Buffett: If you improve agricultural techniques though, you're going to change the lives of hundreds of millions of people. Just look at what it's done in this country in a couple of hundred years. It was innovation when the planter came along, when the tractor came along. If you look at how primitive agriculture is in so much of the world, you're really talking about hundreds of millions of lives that can be improved if you enable them to get more out of the agent than they've been getting before.

Charlie Rose: I just want to touch on, because I've seen, what you've learned about Ebola and other possible diseases and how this global community can do something that they hadn't done before to be able to make sure that the worst doesn't come.

Bill Gates: Ebola, we're still in the final efforts to get the numbers down to zero. The numbers are down quite a bit. Even once they do get to zero, the three effected countries will need a lot to rebuild back to decent health systems and get their economies going. It's also a lesson globally. We were lucky that it stayed in the three countries and didn't get more widespread. There are diseases other than Ebola that will come in the future.

Charlie Rose: You were concerned about an early warning system and the capacity to respond early with the maximum.

Bill Gates: Right. What you need is a reasonable healthcare system and then surveillance sights that are gathering data from them. The foundation is reaching out to other people to say, "Let's get this early system going." There's a lot of reports being written about how to strengthen the WHO that kind of has a central role here. The contrast I've drawn is that when it comes to military activities, we have people on

reserve, we do training, we plan ahead. For an epidemic, which could be a natural epidemic or even worse intentionally bio-terrorism epidemic, we're not as ready. We don't have the volunteers and the supplies and the training. The only good thing that could come out of Ebola is if it's used as a wakeup call and those resources are put into place so that we'd be a lot faster. That will be very important, and it's a very infectious agent then Ebola.

Charlie Rose: Warren, sitting and listening to these two people must make you enormously proud because of their enthusiasm and because of the commitment to be there, but also as they live this experience, they like you, could be doing a lot of other things. Something brings the three of you to this table, to a table wherever you are, whether it's Seattle or Omaha, wherever it might be. India. The driving compassion, and the driving will to make a difference.

Warren Buffett: What you hope is somebody listening to just like we through leading or whatever it may have been experience, Bill had parents that were very involved in philanthropy. They just think it through a little bit as to what they can be doing and a lot of people do things individually that I admire a lot more than what I'm just doing with money. They pour themselves into it every day in terms of helping. My older sister does that. She spends every day at age 87 helping other people. She's giving up far more than I'm giving up. I'm giving up some money but I'm not giving up time. I've had two people come ten thousand miles just to talk to me for an hour, hour and a half, about philanthropy and the giving pledge. It's fascinating. Remote part of the world, I won't identify where they're from. If it strikes a chord, who knows where the ripples go.

Charlie Rose: Thank you for coming. Thank you.

Bill Gates: Thank you.

Melinda Gates: Thank you Charlie.

Charlie Rose: Thank you Bill, thank you for joining us.

Bill Gates and Warren Buffett (2017)

1/27/2017

Charlie Rose: Bill Gates and Warren Buffett are here. Gates is the co-chair of the Bill and Melinda Gates Foundation. The philanthropy focuses on education, poverty, and global health. Warren Buffett is Chairman and CEO of Berkshire Hathaway. The company is one of the most successful companies of the last five decades. The two have famously been friends for more than 25 years. Together they started the Giving Pledge in 2010, the initiative encourages the world's richest to donate the majority of their wealth to philanthropic causes. Buffet pledged the bulk of his wealth to the Gates Foundation in 2006, and has since given more than \$24 billion to charities. I am pleased to have both of them back at this table. Welcome. And I have to say in the interest of full disclosure, we just did something like this at Columbia University with a thousand students. You two do this before. There is something special about the curiosity and the interest of young people wanting to know how do they learn from you. Wanting to know if you were starting over what would you do? Wanting to know about values. You do a lot of this.

Warren Buffett: Well, about the friendship, we met on July 5, 1991, and hit it off immediately. Bill was a little reluctant at first, but he got there.

Charlie Rose: Reluctant to come.

Warren Buffett: Yes, if it wasn't for his mother, we probably wouldn't know each other. And we have had a good time ever since. And we've cooperated on, particularly on the Giving Pledge, but other things as well. And I have to say, everything about it has turned out well.

Charlie Rose: He sits on your board.

Warren Buffett: He sits on the Berkshire board, and we have a lot of fun talking about a lot of things. But the big thing that really came out of one of those discussions really was the Giving Pledge. That's worked out so much better than I ever anticipated, Charlie. I mean, I thought if we got 30, 40 people, you know--

Charlie Rose: And how many have you --

Warren Buffett: I think we're at 156 or something like that. And the people -- and now we've gone beyond the borders of the United States, which I didn't feel would originally happen. And people are learning more, our members, about effective philanthropy. They're learning about things that didn't work. They're learning about how people handle, within their families, wealthy families, and it's just worked out so much better than I would've guessed six years ago or seven years ago.

Charlie Rose: Both of you have made the point that there are a lot -- because of success and technology, there are a lot of people with a lot of money who are much younger.

Bill Gates: Yes, it's a great thing that these companies are doing so well. And as a group, I would say it's a particularly philanthropic group. I didn't give huge gifts until I was 45. Some of them in their 30s are already doing amazing things.

Charlie Rose: Why were you -- if the word is reluctant, reluctant to give earlier than that?

Bill Gates: I hadn't taken the time to understand where the huge payoffs were, and I was pretty maniacal about Microsoft. And only in my late 30s, with some encouragement from my wife Melinda, did I start to study it, talk with her about it. We knew we would do it by the time I was 60, but as we were doing that

learning we decided we should accelerate it and, you know, we found a lot of ways that we thought we could have high impact.

Charlie Rose: And the principle, sort of, mission call was that all lives are equal.

Bill Gates: That's right. And a lot of that outside the United States has gone to save lives and have kids grow up to be healthy.

Charlie Rose: How did you decide that you would rather give your money to the Gates Foundation than create some foundation of your own, and go out and find people to run it and do whatever you wanted to do.

Warren Buffett: Well, my first wife, Susie and I actually started a foundation over 50 years ago, and we had talked about it since we were in our 20s. And I always thought I'd be red sheeted, didn't think I would be, but -- and I said to her, if I compound money at the rate I hope to compound money, there will be really large sums later on, and you're good at giving it away, I'm good at making it, so I'll make it first and you give it away. And she thought that was sort of half a cop-out and half logical. (LAUGHTER)

Charlie Rose: And probably told you so.

Warren Buffett: Yeah, absolutely. And so we did something, like I say, it was started over 50 years ago, but I really thought that there would be large sums later on, and that she was particularly good at empathizing with people, understanding their needs, putting the personal energy into it, everything. She would be better at giving away money than I would be, and she died in 2004, as you know. So then I had to re-think what I was going to do. And so in 2006, I decided that, essentially, five foundations, the Bill and Melinda Gates Foundation being the largest, and I'm looking for people that had similar goals with philanthropy that what I had. And the idea that every life is of equal value is just fundamental to me. You know, with your luck you can be lucky.

Charlie Rose: And you knew Bill would run it well.

Warren Buffett: Oh, of course. I mean, he was putting -- he had his own money up which is a big deal. But, far more than that, I mean, you had two much younger people, very bright, very hard working. They work much harder at this than most people do in this country in their jobs. And they were on the same track I was on, a proven quantity, I mean, everything about it made sense. And it's continued to make sense ten years later.

Charlie Rose: Bill talked about Melinda's influence. You have said to me about Susie, your late wife, I was a mess until I met Susie.

Warren Buffett: I think that's understating it. (LAUGHTER) She changed my life, there's no question about that.

Charlie Rose: How did she change your life?

Warren Buffett: Well, I was a very lop-sided, not well adjusted person who happened to be very good at one thing, and she put me together. I mean, it wasn't overnight, either, but she just had that little sprinkling can, and finally, she saw a few sprouts come up.

Charlie Rose: Was it a coming together of opposites or?

Warren Buffett: No, no, I wouldn't say that. We had very similar values, we were in sync in a very big way, but she was way more mature than I was. She was 19 when we got married, I was 21. I was about 12

emotionally. And she put me together. And like I say, it took time, but it changed my life. I would not have had roughly anything like the life I have had.

Charlie Rose: And what did Charlie Munger add?

Warren Buffett: Well, Charlie Munger, my partner of 57 or 58 years, and he's extremely wise. He's a wonderful friend. We've been partners that time, and he's strong minded, I'm strong minded, we disagree sometimes, we have never had an argument in that whole time, and we never will.

Charlie Rose: Never had an argument?

Warren Buffett: Never had an argument. I won't lie. That's absolutely true.

Charlie Rose: But you must disagree on things.

Warren Buffett: Absolutely, we disagree.

Charlie Rose: So if you disagree, how do you decide to--

Warren Buffett: Well, what he says at the end is -- when we disagree, he says, well, Warren, you'll end up agreeing with me because you're smart and I'm right. (LAUGHTER) You know, where do I attack that particular problem?

Charlie Rose: I'm right, you're smart, you'll figure out I'm right.

Warren Buffett: Often he's right. I have to say that. Listen, I respect his opinion enormously whenever he gives it to me. I respect Bill's opinion. I mean, but it's more fun doing thing with partners. I mean, the most fun is, obviously, a marriage partner. And that's the most important relationship, but having a business partner, if I had done everything I had done -- it wouldn't have worked out this way, but let's say I got double the results, it's been more fun doing it with Charlie.

Charlie Rose: Who says no to Bill Gates?

Bill Gates: Well, Melinda Gates. (LAUGHTER)

Warren Buffett: I've seen it happen. (LAUGHTER)

Bill Gates: It's great when somebody knows, you know, when you might move too fast or be over optimistic. Or, you know, if a team comes in and I'm pointing out things we haven't done and, you know, maybe they're not as motivated afterwards. So, you know, they get me to correct that. I've matured a lot and I give Melinda immense credit. She still has work to do, but I think I'm getting there. And complementary strengths where you share the same goal is a great thing. I had that with Paul Allen in the early days of Microsoft. I had that with Steve Ballmer as Microsoft got going. Now both in my family life and the foundation, it's Melinda.

Charlie Rose: How much time do you spend at Microsoft?

Bill Gates: I'm there about 15 percent of the time. And I get to work just on the R&D part, brainstorming with people, thinking, OK, how are we going to take this artificial intelligence and make it understand, help you use your time better. It's a very exciting time in software. There's five companies that are, you know, in a really strong position. Microsoft is leading in some really cool stuff so --

Charlie Rose: Like? (LAUGHTER)

Bill Gates: Oh, the way that a business takes information about customers, about communication with customers, looking at data, that mission of really using data in A.I. and getting the productivity of all those workers up because they see more information, Microsoft is the leader on that. And it's a wonderful niche. You know, it's a multi-hundred billion-dollar niche that they're strong in. And they will be innovating along that line more in the next two years than ever in our history.

Charlie Rose: You have a passion for artificial intelligence, you do.

Bill Gates: Yes, it's the ultimate dream when you start working on software is the kind of deep understanding and intelligence that humans have. So it's been the holy grail of when can the computer learn to play games, when can the computer learn to read, when can it understand speech. And things like speech and vision have made such progress in recent years. I mean, you've been tracking this and exposing your viewers to some of it, because I can't overstate that even for people in the field, it's a pretty magical time.

Charlie Rose: And its potential is to do what? Change everything?

Bill Gates: Well, in the first instance, to be the best assistant ever, to look at all your information and help you know in the few minutes between meetings what you should look at, or when you're trying to, you know, plan a trip, organize things, the things to be a much, much, much, much better assistant than it is today. And then, eventually, certain mechanical tasks like warehouse work or driving, that it would take that over. But for intellectual work, it will just magnify the creativity and make your time more valuable.

Charlie Rose: Are you interested in technology?

Warren Buffett: I don't have enough -- I don't think I have a natural -- bent that way to start with and I would be so far behind. I never would catch up with people that have been working on it. It would not be a game I would be winning.

Charlie Rose: Is a principle criteria for you understanding the business?

Warren Buffett: Yes, I have to understand the business. And there's lots of businesses I don't understand, some of them may be almost un-understandable, and others are just outside my sphere of confidence.

Charlie Rose: But you do have people now that do have that kind of expertise that you have brought in.

Warren Buffett: I have two people who themselves have different circles of competence, but they aren't chosen because they have a different circle, there is a lot of overlap, there's overlap between them, and the important thing is not how -- it's nice to have a huge circle of competence, it's much more important to know where the limits are of it. You can do very well if you only understand five percent of the businesses in the country. (LAUGHTER)

Charlie Rose: And find plenty of opportunities.

Warren Buffett: And you know which five, you've got the five percent are in that circle.

Charlie Rose: I mean, you've made a huge purchase in 2016. Precision was bought in 2016, \$37 billion.

Warren Buffett: Including debt, \$33 or 4 billion cash, and assumption of about \$4 billion in debt.

Charlie Rose: Is it harder and harder to find an acquisition candidate because...

Warren Buffett: Sure, I mean, we've got to move the needle on \$400 billion of market value. And, you know, if we make a billion dollars, you know, we're talking a quarter of one percent, and that's after tax. I

mean, that's more than a billion and a half pre-tax. So it's hard to find things. I would do better percentage-wise if I was working with a much smaller amount of capital.

Charlie Rose: How do you find them?

Warren Buffett: It's interesting. I get a call, be sitting thinking, I mean, different things. In terms of buying private businesses because I get a call from a private seller, but occasionally I just decide to act, and we never do anything unfriendly, but in terms of buying whole businesses.

Charlie Rose: But are there people who know you and are close to you on the lookout for you?

Warren Buffett: Not much. (LAUGHTER) Charlie, we've net bought 12 billion of common stocks since the election. It's in my mind which ones I pick. Now, the guys that work with me, the two fellows they probably bought a little bit or sold a bit too, but those are just ideas that I've either come at from a different slant in some way, or whatever it may be.

Charlie Rose: Is airlines one of those?

Warren Buffett: It was shown -- I won't tell you anything -- it was shown on September 30th that we own some airlines.

Charlie Rose: Right.

Warren Buffett: Some stocks.

Charlie Rose: And so why did you do that?

Warren Buffett: Well, that I won't get into it. (LAUGHTER) But it was in large part my decision.

Charlie Rose: The old joke is, as you know --

Warren Buffett: Absolutely.

Charlie Rose: -- how do you become a millionaire, start as a billionaire and buy an airline.

Warren Buffett: There is no question it's been a graveyard for a lot of money.

Charlie Rose: Yes. But transportation has been something.

Warren Buffett: Yes, but they're not related.

Charlie Rose: Railroads.

Warren Buffett: The railroads and airlines are not related.

Charlie Rose: At all.

Warren Buffett: They're different kind of businesses. You can't move the track, you can move planes around. I mean, airlines and track people, there is a certain romance to it like Hollywood does or something. And so you can actually go into the business, and more than 100 airlines have gone broke in the last 25 years or something like that, so it's a different sort of business.

Charlie Rose: How has knowing Bill changed, or influenced, or enhanced your sense of the way the world works?

Warren Buffett: Well, I learn from him. I like to learn from all friends, and Bill happens to be a particularly good source. But that's the fun of having friends, Charlie. I don't think I would be -- would be hard for me to be a friend with anyone I don't learn something from. They probably get kind of bored with me -- who's that guy talking about stocks? (LAUGHTER)

Charlie Rose: And Bill, what have you learned from him being associated with him?

Bill Gates: Well, an immense amount. You know, he wrote an article for "Fortune Magazine" that I read before I met him about -- that it's not necessarily a good idea to leave large sums to your children. So that was pretty fundamental. And I remember reading that and I was convinced that that was right, and I thought, wow, now you have to think of how to give it away. I also remember Warren showing me his calendar.

Charlie Rose: Oh, I love this.

Bill Gates: You know, I had every minute packed and I thought that was the only way you could do things. And the fact that he is so careful about -- he has days.

Charlie Rose: That there's nothing on it.

Bill Gates: That's there's nothing on it.

Warren Buffett: Absolutely. (LAUGHTER)

Bill Gates: It's very high tech, be careful, you might not understand it.

Charlie Rose: This is the week of April, of which there are only three entries for a week.

Warren Buffett: There will be four maybe by April. (LAUGHTER)

Bill Gates: File taxes.

Charlie Rose: So it taught you what, not to crowd yourself too much and give yourself time to read and think and...

Bill Gates: Right. You control your time. And that sitting and thinking may be a much higher priority than a normal CEO, where's there all these demands and you feel like you need to go and see all these people. It's not a proxy of your seriousness that you fill every minute in your schedule.

Warren Buffett: And people will want your time. I mean, it's the only thing you can't buy. I mean, I can buy anything I want, basically, but I can't buy time.

Charlie Rose: And so to have time is the most precious thing you can have.

Warren Buffett: I better be careful with it. There is no way I will be able to buy more time.

Charlie Rose: And living in Omaha makes that easier?

Warren Buffett: That makes it a lot easier. For 54 years, I spent five minutes going each way. Now, just imagine that was half an hour each way, I would know the words to a lot more songs, and that's about it.

Charlie Rose: It adds up, doesn't it?

Warren Buffett: It really adds up. If you're talking an hour a day difference coming and going, and that's two and a half percent of the person's work week, that means 40 years, you're talking about a year.

Charlie Rose: Do you agree politically?

Bill Gates: On almost everything. You know, the general sense that you've got to keep the economy turning up greater output, and that you have to allocate it in a fair way. Yes, that basic framework we see very much the same.

Charlie Rose: Do both of you believe we can achieve a four percent growth rate?

Warren Buffett: That's very high.

Charlie Rose: Pretty high.

Warren Buffett: But, a two --

Charlie Rose: By just -- like, 2016, I think the last quarter was like 1.6 or something.

Warren Buffett: Charlie, a two percent growth rate, if we have little less than one percent population growth, which we probably will. In one generation, 25 years, now people have kids a little later, we'll add 19,000 per capita, family of four, 76,000 to real GDP. So a family of four on average, there would be 76,000 more stuff per family of four in one generation. I mean, we are going to have more -- the goose is going to keep laying more golden eggs. We've got a wonderful system.

Charlie Rose: Well, but there are certain things that could get in the way of that.

Warren Buffett: Two percent? I think we'll do two percent.

Charlie Rose: No, you'll do two percent.

Warren Buffett: Yes, and two percent will produce miracles.

Charlie Rose: Yes, but three percent is probably possible, isn't it?

Warren Buffett: It could be, but that would be fabulous.

Charlie Rose: Right.

Warren Buffett: And -- but two percent will -- 19,000 per capita, that's greater than exists in a whole lot of countries, that will be added. The question is what we'll do with it.

Charlie Rose: How do you see the future of China?

Bill Gates: Well, they've done a great job on some things. They're not a democracy, so it hangs in the balance how their political system will evolve. But in terms of raising incomes, getting rid of poverty and improving health, it's an unbelievable miracle that they embrace in their own special way of the market since really just 1990, they've done very well. And so they're the second biggest economy in the world. They're serious about trade. They're serious about clean energy. They are super important. The most important relationship in the world is the U.S.-China relationship.

Charlie Rose: Clearly, because they're the two biggest economic powers in the world.

Bill Gates: Right, and they're rising --

Warren Buffett: And they'll continue to be.

Bill Gates: And we're strong and we're going to stay very strong.

Charlie Rose: What could make us not stay strong?

Bill Gates: There's a lot of strength that we've built up over decades, the way we do research, our universities, the way that people take risks, and that's why our technology companies are still so strong. Our biotech companies are still so strong. So the education system is one that, you know, we need to go back and look at, you know, and that is one huge source of inequity, because if you get a great education, actually, the outcomes are pretty good.

Charlie Rose: Experience has told you -- your experience has told you it's much harder than even you imagined.

Bill Gates: Improving the U.S. education system, yes. The dropout rate has gone down a bit, so that's great. But the overall reading scores, math scores, and the inequality hasn't budged much in the last ten years. One of the goals of our foundation is to, working with partners, change that, and, so far, it's proven to be one of the tougher ones, we still believe that it's super important, and they are promising, if we look at individual schools, we see great things, so we still believe it's achievable.

Charlie Rose: All the talk about immigration, I want to talk about it a little bit, but all the talk about immigration, are we still looking at a situation where some of the best and brightest from overseas come here, get an education, and then go back to India, or China, or wherever, rather than staying here?

Bill Gates: Well, a lot do stay. And the most important import the U.S. has ever had by far is human talent. It's been to our benefit that a lot of the hardest working, best and brightest from almost every country in the world have wanted to come to the U.S. And so if you look at university departments or, you know, doctors, engineers, people starting up companies, building jobs, it's been a huge strength of ours. We haven't always made it super easy for that to work, but it has worked very, very well. So the number going back, it's meaningful, but net we are still a huge beneficiary of human talent.

Charlie Rose: But it used to be said and Tom Freedman, I think, first wrote this, we ought to staple a green card to every diploma.

Bill Gates: Yes, I believe that. Now, is that a bias because I'm from the tech industry where we can create multiple jobs around the engineer instead of having to do that outside the United States? Yes, I believe that keeping talent in the country is a great thing.

Charlie Rose: Tell us a story, because you told me the story and I didn't have it before -- you think the second most important document in America's history after the Declaration of Independence, or perhaps the U.S. Constitution, or both, you know, is this letter by two immigrants.

Warren Buffett: A letter written by two Jewish immigrants. That doesn't sound like much until I tell you one of the things, but in August of 1939, just before Germany moved into Poland, Leo Zolard, whose name is not well known, who was born in Hungary, but he went to Germany, and he worked in Germany with Albert Einstein. And in 1933, I believe both of them left Germany, and where do they come? They come to the United States, and they become United States citizens. And they co-sign a letter to President Roosevelt, it was a lark he got Einstein to sign it because his name carried more weight. And that letter which you can see on the internet, not even a full page, says, Germany -- I'm really paraphrasing here, but Germany is going to get an atom bomb and it may work. It didn't say for sure it would. And we better get to work on one. And the Manhattan Project came out of that and I don't -- who knows what would have happened in World War II, A, if Hitler hadn't been so anti-Semitic basically, I mean -- great scientists and everything. And secondly, if those two hadn't chose to emigrate to the United States. I mean, the United

States, you know, it welcomed them, and they may have saved this country. They may have saved this country.

Charlie Rose: So Germany did not get it and we did.

Warren Buffett: And all those D1s and D2s that were lobbed over there in England, they just didn't have the right warhead from the standpoint of the Germans. And if we had started three years later, who knows what would have happened? Remarkable men and they were both immigrants.

Charlie Rose: You sent me a note maybe a month ago, and you basically said I'm not worried about the American economy.

Warren Buffett: That's right.

Charlie Rose: What I'm worried about is that somehow in some way we'll make a mistake in terms of the deployment of nuclear weapons. Or some bad character will buy them or steal them.

Warren Buffett: Weapons of mass destruction are out there.

Charlie Rose: Some tragic accident, maybe a computer blip.

Warren Buffett: It's a tiny, tiny probability any given day. But there are people who wish us ill. There are people would like to kill millions of Americans. And there's some psychotics, there's religious fanatics, there's megalomaniacs, I mean the world has a certain number of them, and if they get in the wrong position and they have the knowledge and they have the ability, there are people who would love to kill millions of Americans and the weapons are there to do it. I mean, when we -- Einstein said shortly after the launch of what was then called the atomic bomb, he said, I know not with what weapons World War III will be fought, but World War IV will be fought with sticks and stones. And that probability exists. And it's the number one job of the president of the United States, whichever president acknowledges, is to the extent possible, protect us from weapons of mass destruction. And they can exist with individuals, but you don't worry too much about that, the intent, but with organizations and maybe even with a couple of nations. And it's the only real cloud on America over time. We'll solve the economic problems, but that's number one.

Charlie Rose: You agree?

Bill Gates: I agree, and it's not just nuclear weapons.

Warren Buffett: No.

Bill Gates: The bioterrorism piece is also quite daunting, and --

Charlie Rose: What's the bioterrorism piece?

Bill Gates: Well, in an extreme case, somebody would reconstruct, say, a smallpox virus and have that spread, and it would not only kill millions, it could potentially kill billions.

Warren Buffett: I think there was an op-ed piece in "The New York Times" within the last two years. I check with Bill because I don't understand this stuff, and he said, yes, it makes sense. That in terms of being feasible -- and it was basically about reconstituting small pox. I mean, there are people in the world, there are maybe organizations, probably are organizations, that would love the idea of creating a small pox epidemic.

Charlie Rose: And how do you prevent them from doing that?

Bill Gates: Well, you want to have surveillance to catch it as soon as you can. You want to have medical tools where you can create a vaccine and protect people. Science is working on the defense part of this, at the same time it's making the offense slightly easier. So if we're vigilant, there is a lot of steps we can take to make the risk lower, just like minimizing access to fissile materials meaningfully reduces the chance of a nuclear weapon.

Charlie Rose: There are some who argue that the next war will not be a nuclear war, or it may perhaps not even bioterrorism, it will be a cyber war.

Bill Gates: That's a third area. And I, you know, personally -- there's only the three, but that's not much comfort. Yes, the -- a modern society depends on electricity and communications and information flow, and if you can, for a substantial period of time, disrupt that, then a lot of systems, you know, including how a hospital organizes itself, or how food gets moved around, or an airline decides what to do -- or, yes, bank accounts, you know, what was that bank account supposed to be? And, so, a lot of experts in government and companies now are spending time thinking about, okay, how do you minimize that? How do you have duplicates, backup, a lot of sophistication going into that.

Charlie Rose: Can the United States risk a trade war with China or with Mexico or -- will it have a --

Warren Buffett: It's not a good idea.

Charlie Rose: It's not a good idea. (LAUGHTER)

Warren Buffett: Trade benefits. The problem of trade is that the benefits are diffused and invisible. So, you don't walk in and buy a pair of shoes or some underwear or anything and it says, you just saved 12 percent because this was purchased by somebody. So, 320 million people are buying things -- the banana syndrome -- they're buying things cheaper than they would otherwise. But, the harmful effects, taking somebody out of a job they've had for 25 years when it's too late to retrain them for anything, they are very specific and terrible. What you want to figure out a way is to keep the societal benefits and take care of the people that really are the -- you know, the road kill basically. And there will be road kill. I mean, there is no sense kidding yourself. I mean, we started with a textile model at Berkshire. Half our workers only spoke Portuguese. They worked in hot conditions, loud conditions, and they spent 20, 25 years on looms. When textiles moved elsewhere, their lives -- economic lives were ruined. And that is going to happen. That is part of trade, and the benefits, you know, when somebody buys whatever textiles we were turning out, handkerchiefs, or whatever, anything, they may buy them a little cheaper. And we got to keep the trade benefits to everybody, us and them, as a society, it penalizes certain people terribly, and we got to take care of the people getting hurt because we got the resources.

Charlie Rose: And take care means what?

Warren Buffett: It means that somehow you have to have some kind of -- you got to have retraining and all that when that's feasible, but when it isn't feasible, when you only speak Portuguese and you're in New Bedford and you're 55 years old and you spent your whole life on a loom, you got to make sure that person has an income that's commensurate. We can do it as a society and we don't want to let the individual case prejudice us against trade benefits for everybody, but we don't want to say because everybody is benefiting to hell with this guy. We can afford that and we should do it and that's how we'll get a good trade policy.

Charlie Rose: Did you appreciate, Bill, the economic insecurity that was out there that Donald Trump was able to tap into politically?

Bill Gates: No, I'm not an expert on political sentiment, so I was no better at seeing those trends than other people.

Charlie Rose: Brexit and --

Bill Gates: Again, I was surprised by the Brexit vote.

Charlie Rose: Yes. And the notion of the populist uprising that have taken place in the sense of feeding off of that.

Bill Gates: Well, there is no doubt that younger people and urban people in terms of their social mores and being seen to benefit relatively more from the new technology and things that are out there, there is somewhat of a divide there. The fact that that would lead to these political results is a bit of a wake up call to say okay, what is in terms of economic and social issues are, you know, can we buy improving medicine, improving the education system, can we take what the negative views are there and engage in an -- uplift their views to the future. To me the greatest surprise of all isn't how people voted, because I didn't think of myself as having expertise on that, but this general question when you say will your children be better off than you? I believe their children will be better off. But the fact they don't feel that way, that the improvements in health and the new products that will be available to them.

Charlie Rose: What technology enables them to do and all of that.

Bill Gates: Right. That is a concern because if people don't see the arrow of time pointing towards greater things, the idea of doubling down on more research and taking the best education and getting that spread around, it creates a sense of malaise where you don't have the guidance and say, hey, some things are working, let's do more of those things.

Charlie Rose: But the question I ask also is can America lose? I mean, if you look at today, we have the best military, we have the best economy, we have the best universities, we have the best talent, and we have the best spirit of innovation and creativity, could we lose that?

Warren Buffett: I don't think we will. I think the odds of losing that are very --

Charlie Rose: This is what you call the special sauce?

Warren Buffett: We've got the special sauce and we still got a special sauce. If the rest of the world learns from that special sauce, then it's not a zero sum game, that's terrific, but it won't deprive us. So overall, in aggregate, our society will be far richer ten, 20, 30 years ago, and you just take an aggregate, our children will live better. The real question is, will it continue to leave lots of people behind? A specialized market system will leave people behind. There is -- if somebody is, however you want to measure it, ten percent below average, their opportunities in this world today have not improved at all from 30 or 40 years ago. The classic situation is you take the Forbes 400. In 1982, the number one guy was Dan Ludwig which you've never heard of and had \$2 billion. Now it would be 30 or 40 times that. 30 or 40 times. And this more highly specialized economy, year after year, different from that agrarian economy of 200 years ago, it's going to be more and more people at the very top winning big, big, big time. And it really won't do, absent certain types of programs, it won't do much for the person who really doesn't have any special skills for the market. The average person -- or slightly below average person in terms of particularly market talents -- is not going to do very well unless we have a policy to make sure that they participate in some way. And the guys at the top are going to keep doing better.

Charlie Rose: Policies from the government?

Warren Buffett: It has to be government. Government is always -- I mean, the market system is a traffic cop. It directs resources, it directs brains, and it does a great job of it, but it also directs all the winnings. It will continually favor more people at the top. Government came in with social security and government redirects the winnings so it isn't totally the market system that delivers the winnings. But I don't want to kill the market system in terms of producing at all. We want more and more stuff, but there will be more and more people falling further, relatively, behind, and that's not a good result. I mean, we can afford and we can do better.

Charlie Rose: I'm sure you saw this, I mean, there was a report I think last week that suggested, it took eight billionaires and basically said they have more wealth than the bottom half of the population in the world, 50 percent of the people in the world.

Warren Buffett: In this country, if you took the Forbes 400, they have \$93 billion in 1982 and they \$2.4 trillion now, 25 times as much as -- not exactly the same people, the 400 -- 25 times as much as 35 years ago, and, believe me, that does not strike somebody that's working 40 hours a week and trying to support a couple of kids on it and finding --

Charlie Rose: And their income has remained the same or less.

Warren Buffett: They just aren't participating.

Charlie Rose: Or threatened by forces they can't comprehend.

Warren Buffett: They can't -- the market system just pays more and more -- just to say, say you're a middle-weight boxer. In the '30s, you wouldn't even get on the under card of Madison Square Garden and it was limited. But then television comes along and cable comes along and pay-per-view. And tens and tens of millions of dollars. So at the top, it's terrific. But if you're the 45th middle-weight in the country, it's pretty much the same as it used to be in the '30s. So the spread gets wider. If you're Frank Sinatra, you're a lot better off if you got television than playing a theater in New York where you started. It's magnified throughout. If you got a good business idea, you can get it capitalized and become worth billions just on the idea. It's just tougher. Whereas, you know, you go back to 1800, and if you were reasonably strong and willing to work hard, you were worth 90 percent as much on a farm as the very best guy. And it will keep widening, the market system will push it in that direction, but government is there to --

Charlie Rose: What would you change if you could?

Warren Buffett: Well, I would change the earned income tax credit big time. You know, I am where I am not by myself at all. I mean, there are 320 million Americans out there and a lot of crosses over Normandy and everything else. And it just I benefit enormously by having come along when I came along and where I came along. And some people did and some people didn't, and there is nothing wrong with a market system that rewards anybody that makes life better for millions of people. They ought to get enormously rewarded. But you've got to take care of the people that just don't fit well into that particular niche. If this country paid off based on athletic ability, I could study eight hours a day and have all these - - I'm still going to get in the ring or something like that and ten seconds later I'm on my back. So the talents that get rewarded in a market system are important because they bring us more of the goods and services that the country wants and make all kinds of improvements in how we live, just incredible, but they leave people behind and it won't be solved simply by education. You want everybody to --

Charlie Rose: Is it the responsibility of government to do something about it?

Warren Buffett: Sure, it is.

Charlie Rose: Go ahead.

Bill Gates: The government also has to keep, you know, business in shape that it has the incentive to do things right, and striking that balance, you know, should be at the heart of political dialogue.

Warren Buffett: You have the fairest island in the world and two guys living on it and deciding exactly how they should divide up the palm tree, it's the only thing on the island, but it won't make any difference. (LAUGHTER)

Charlie Rose: So beyond national security issues, what do we have to be fearful of in the future? We talked about some people believe artificial intelligence offers certain types of risk and you've spoken to that, that it can become out of control and somehow, you've spoken to that and other people have. What's around the corner that will both benefit us -- artificial intelligence clearly one of those things, too -- but also offers a scary world, whether it is gene editing or that kind of -- you think about these things?

Bill Gates: Yes, gene editing is a good one where the promise of helping with disease, making plants that are more productive. Gene editing is playing with the software of life, sort of the ultimate software work, and yet, deciding exactly how it should be used. You know, if you could make sure your child was thin or, you know, attractive or had certain other characteristics, is that an appropriate use of the technology? So society will have --

Charlie Rose: How do you answer that question?

Warren Buffett: I'll volunteer for the Beta testing on that. (LAUGHTER)

Charlie Rose: I'm serious, Bill, how do you decide that?

Bill Gates: Those are government --

Charlie Rose: The whole thing about is there some balance between freedom and security and it came up in terms of, you know, even in terms of getting inside of a phone in which a terrorist might have left future possible terrorist acts, you know.

Bill Gates: Well, that's another one where, you know, making sure the government isn't completely blind to what goes on in financial transactions, communications, because you trust that the appropriate policies for when and how government's ability to see information is used. That's another one where there will be a big debate about, you know, some extremist might say government really shouldn't see anything, others would say government should see everything, but I think there is the potential for the best of both worlds approach.

Charlie Rose: If in fact there is an appropriate procedure.

Bill Gates: Right, and we have had procedures. And, you know, some people feel that even so some things went on. So there are voices out there that would tend towards the, hey, let's not let government see things, and that's another political question, how much do we do gene editing, how much the government has this ability. You know, we need politicians who really draw in great opinions. Running a health care system and deciding, when people are inventing super expensive treatments, should health care demand so much of the economy that investing in education and social services and those things, that will be another huge problem that will be debated in the political arena.

Charlie Rose: Who has health care right, in your judgment?

Bill Gates: The European countries.

Charlie Rose: Scandinavian or?

Bill Gates: Well, the U.K. spends about half as much as a percentage of GDP as the United States. Now, their system has waiting and things like that, but it's hard to express what a mammoth difference that is. You're talking about almost nine percent of GDP difference. You know, that is one out of 11 people who go to work every day are the extra health care activity here in the United States. So I'm not saying we should just wholesale adopt their system which is a single payer system. There are other really good systems that are not single payer systems. Germany, Switzerland, France, they do quite well. It's one of the few things, access to medical care is one of the few things that we actually do quite a bit worse than other rich countries. There are some like education that a lot of rich countries don't do a very good job on. This one is where we're sort of uniquely bad.

Charlie Rose: Health care and education, we don't do as well as other people, other industrialized nations?

Bill Gates: Most rich countries don't do that well on education and there are pieces like top universities where we are absolutely the best in the world by a lot, so that one we're more middle of the pack, in terms of our treatment, it's health care access where we have to say we look particularly bad.

Charlie Rose: Is there a ticking clock on global warming?

Bill Gates: Yes. Fortunately, it's not overnight. The really big negative impacts are in the 30-year to 70-year time frame, although it has already increased the chance of drought and storms and we're seeing that.

Charlie Rose: You can see a direct causation there?

Bill Gates: Yes, the heating effect is already there. Now, overlaid with that is the Pacific oscillation and normal weather things. So exactly how much of it is the heating signal versus those other things, you can get reasonable disagreement, but there is no doubt that that's there. The global average temperature is rising, and the droughts, particularly in places like the Middle East or parts of Africa are already seeing some of that. And as you go out in time, it gets a lot worse. So changing the energy system which has a long lead time of invention and deployment, you know, I feel this is one of the most urgent problems.

Charlie Rose: And is the urgent answer finding alternative sources of energy?

Bill Gates: Finding that magic three characteristics -- reliable, clean, and low cost -- and there are many paths to get there. And so we have to encourage lots of innovators trying different things. If you could take sun and turn it directly into gasoline, that would be an approach because that can be stored 24 hours a day and even moved around very well. There is approaches that involve taking nuclear to a new level of safety and lower level of cost so that would be a key part of the system. We need to fund a lot of innovative ideas, both governments and private sector.

Charlie Rose: Is your life today more intellectually challenging than when you were running Microsoft?

Bill Gates: That's hard to compare. I'm on a steep learning curve in both cases. You know, I love the fact that I get to meet great people, I get to see things work, see things that fail. For this stage of my life, I'm in a perfect position, I couldn't be happier.

Charlie Rose: Because you have an influence on Microsoft. I mean, not just being software.

Bill Gates: I enjoy going over and sharing my thoughts. I get to keep up to date a little bit because of that. And we're using some of those digital enablement things, like, to get cheap financial services to poor

people all over the world, or to look at medical data. And so staying up to date on the digital piece helps me do my foundation work.

Charlie Rose: You said something akin to this, you know, the average person today lives better than John D. Rockefeller did when he was alive.

Warren Buffett: That is true.

Charlie Rose: The richest man in the world at the time. Live better.

Warren Buffett: Yes, lived better. Yes, in terms of your entertainment choices, your travel choices. You couldn't buy them. That's in one lifetime. It's amazing.

Charlie Rose: What brings you the most satisfaction, beyond family?

Warren Buffett: Well, the greatest satisfaction is just staying in good health. When you're 86, you look at this a little differently. (LAUGHTER)

Charlie Rose: You're in good health?

Warren Buffett: Oh, yes. I enjoy every day. I enjoy --

Charlie Rose: What is it that you enjoy?

Warren Buffett: Well, I enjoy running Berkshire, if you get right down into my psyche.

Charlie Rose: That's what I want to know.

Warren Buffett: It's been my painting for 50-some years. I get to paint what I want. I don't have to do, you know, follow what Wall Street is telling me to do next quarter or something like that. So I own the brush, I own the canvas, and the canvas is unlimited. It's a pretty nice game and I get to do it every day with people I like. I don't have to associate with anyone that causes my stomach to churn. If I were in politics, I would have to smile at a lot of people that I want to hit.

Charlie Rose: You just don't talk to them.

Warren Buffett: It's really, I've got a good deal. I'm hanging on to it. (LAUGHTER)

Charlie Rose: I often repeat this story, Brook Ashton once said to me, I spent too much of my life worrying what people thought of me, and then I only care about what I think of them. (LAUGHTER) I only want to see people that I like.

Warren Buffett: Yes, and my business -- I'm lucky that way. I mean, business is so much easier than philanthropy. Philanthropy may be a whole lot more important, but in business you're looking for kind of easy choices, you're looking for people that you like to associate with. I mean, to an extent, I can create a world around me.

Charlie Rose: Are you saying to me that if somebody walked in your door and wanted you to buy their company and you saw it as a golden --

Warren Buffett: Golden goose with a farmer I didn't like. (LAUGHTER) I would say no.

Charlie Rose: You would say no. Even though you knew it would --

Warren Buffett: Charlie, marrying for money is probably a bad idea under any circumstances, but if you're already rich, it doesn't make any sense at all. (LAUGHTER)

Charlie Rose: But the satisfaction -- what's the metric of satisfaction?

Warren Buffett: It's doing a decent job of running a place that gets harder to do because of size over time - - but it's working with a whole lot of people on interesting -- it's like Gene McCarthy said about being a football coach, it's just difficult enough to make it interesting but it really isn't that hard. (LAUGHTER)

Charlie Rose: McCarthy said that?

Warren Buffett: Yes. Well, he had a way of getting people irritated sometimes.

Charlie Rose: What brings you the greatest satisfaction?

Bill Gates: Learning things and making breakthroughs. After all the great family stuff, that is a lot of fun. Every once in a while, if something really makes sense and you can teach people about it, share an insight, I think that's also very satisfying. You know, when I sit down with Melinda to write the annual letter, the idea of, okay, I've had a chance to see things, what could I share that is really succinct that might be helpful to people? That is fun. It's hard. It doesn't happen all the time, but between my learning and being able to share where I see, oh, this is simpler than I thought it was, that gives me great satisfaction.

Warren Buffett: I would say this, too, Charlie. Now at 86, I've seen a lot of people who've gotten older. And I've never seen anybody who's 70 or pick an age who felt good about their children that felt bad about their life. In all my experience.

Charlie Rose: You never have seen anybody who felt good about their children that also felt bad about their life?

Warren Buffett: Yes, and I've seen plenty of people with lots of money where it hasn't worked out well in the family.

Charlie Rose: Who didn't feel good about their children.

Warren Buffett: Or the children didn't feel good about them, whichever way, but they failed at the most important teaching job they had and personal relationship, and sometimes it happens for extraneous reasons, but I really have never met anybody, regardless of their economic circumstances, who felt their life was a failure --

Charlie Rose: If their children have become.

Warren Buffett: If they love their children.

Charlie Rose: And their children were doing --

Warren Buffett: Absolutely. They felt good about -- you know, they brought them into the world.

Charlie Rose: Achievements and felt like they had put themselves for the future.

Warren Buffett: I knew one fellow who was extraordinarily rich. He put a lot of money in his kids' names. He didn't want them to have any control over it. Once a year, he would have dinner with them and try and get them to sign their income tax return blank. Just imagine that. These four kids, none of them, he wanted to have enough confidence in them -- it's just crazy. I mean, he would woo them during those

dinners, they knew exactly what was going on, once a year, and then he's bribe them to sign their income tax return blank so he could file it and they wouldn't know what they have. I mean, when you have adults -- I've seen just time after time when people who have been successful -- I've seen plenty of the other, too -- but successes at business and failure -- and I don't think they feel that good about life.

Charlie Rose: Thank you for coming, great to see you. Bill, thank you very much. Bill Gates and Warren Buffett for the hour. Thank you for joining us. I should mention on HBO on January 30th, there is a film called "Becoming Warren Buffet" in which you will see a remarkable sense of the evolution of a human being and surrounded by family but also the lessons and experiences that 86 years have given him. See you next time.
